The Pills improve the appetite, strengthen digestion, and regulate the Liver. Under treatment with the Ointment, Bad Legs become sound, scorbutic skins cast off their scales, and scrofulous sores cease to annoy. The combined use of these remedies checks all tendency to irritation in the bowels, and averts Diarrhœa, and other disorders of the intestines, frequently prevailing through the summer and fruit seasons. Heat bumps, Blotches, Pimples, inflammation of the skin, and enlarged glands can be effectively overcome by using Holloway's Pills and Ointment according to printed directions accompanying each pot and box.

RUSTIC ADORNMENTS
FOR
HOMES OF TASTE.

BY THE LATE SHIRLEY HIBBERD.

New and Revised Edition by the Editor of AMATEUR GARDENING.

"This new and revised edition maintains its position as something more than an ordinary amateur's guide; it is a practical work brought up to date so as to keep abreast of fashion and taste as displayed in the floral decorations of the table, the home, and the garden. This work would make a useful present to anyone."—*The Bazaar, the Exchange and Mart.*

"We cannot imagine a more appropriate presentation book than this to persons who delight in flower and attractive home surroundings. It is worthy a place in any 'home of taste.' It abounds in useful practical hints, and is eminently readable from end to end."—*Journal of Horticulture.*

NATIVE GUANO FOR POTATOS, VEGETABLES, &c.

C. H. TINDALL, Bardney: "Used for Potatos. Result very satisfactory; yield much above average. A splendid manure." G. WATTS and SONS, Bournemouth, report: "Good for general purposes. Grand for all Root Crops, Tomatos, and Cucumbers. Find it so cheap; and it does not exhaust the ground like other manures."

NATIVE GUANO FOR FRUIT, ROSES, TOMATOS, &c.

E. F. USHER, Sidcup: "Potatos and carrots, splendid crops; Peaches, Nectarines, &c., splendid. Should not like to be without it on any consideration." G. STONARD, Gardener to Sir A. T. Watson, Bart.: "Used for seven years for Peaches, Grapes, Tomatos, Cucumbers, Roses, and Chrysanthemums with excellent results."

Orders to the **Native Guano Co. (Limited)**, 29, New Bridge Street, Blackfriars, London, where pamphlets of testimonials, &c., may be obtained. Agents Wanted.

THREE INSERTIONS FOR THE PRICE OF TWO!

AS GARDENER (Single-handed); age 24; 9 years' experience Inside and Out; good references; single at present.—W. SIMPSON, King Street, Cottingham, Hull, Yorkshire.

BARR and SONS have on their Register several competent HEAD GARDENERS. They will be pleased to furnish full particulars on application.—12 and 13, King Street, Covent Garden, London.

GARDENER (Head or good Single-handed), with help, well up in management of fruit trees, seakale, tomatos, mushrooms, cucumbers, kitchen garden, pleasure grounds, flowers, land, stock, poultry if required; 15 years' excellent character present place; leaving through employer's death; married; middle age.—J. SANSOM, Barcate Cottage, Faringdon, Berks.

FOREMAN (Inside); age 25; practical experience in plant and fruit houses, house and table decorations; excellent references.—W. BURCH, 17, Bismark Road, Highgate, N.

FOREMAN; age 27; good experience in fruit and plant houses, and table decoration; good references.—GARDENER, 2, York Villas, Thornton Road, High Barnet, Herts.

FOREMAN, Inside; age 29.—Mr. Osborne, Grove Gardens, Teddington, Middlesex, can thoroughly recommend his Foreman. Well up in Plant Growing, Early and Late Forcing, Fruit, Melons, Cucumbers, Orchids, &c. Near London preferred.

GARDENER (Head), where two or three are [illegible]; age 33; married, no family.—Rev. G HENSLOW, Drayton House, Ealing, W., will be pleased to RECOMMEND E. Post as above; 17 years' experience; Inside and Out.

GARDENER (Head or good Single-handed); 13 years' experience inside and out; capable and trustworthy; single.—A. M., 11, Bertram Cottages, Hartfield Road, Wimbledon.

GARDENER (Head, or where help is given); 12 years' experience; married when suited; age 27; excellent references from past and present employers; no circulars. —[illegible]TERILL, Manor Cottage, Old Windsor, Berks.

GARDENER (Head Working or good Single-handed); age 28; single; thoroughly experienced [illegible], fruit, and flower garden, lawns, &c., little glass; [illegible]teen years' good character; abstainer.—PRITCHARD, Low Farm, Wellesbourne, Warwick.

GARDENER (Head Working); where two or three are kept; 16 years' experience; age 30. Mr. [illegible] A. Miller will be very pleased to RECOMMEND his foreman as above.—S. PEET, Underley Gardens, Kirkby Lonsdale.

GARDENER (Head Working); age 33; where three or four are kept; thoroughly understands vines, peaches, melons, stove and greenhouse plants; flower and kitchen garden; 16 years' experience; well recommended from last and previous employers; married when suited.—HANCE, 17A, Glenwood Road, Catford, London, S.E.

GARDENER (Head Working); age 25; married, no family; life experience in all branches of the profession; excellent references.—W. BURLEY, Knolls, Poplar Road, Leatherhead.

GARDENER (Head Working), age 30; thoroughly practical in the general routine of gardening; experience gained in first-class establishments; 3½ years Foreman in present place; can be well recommended.—W. CONWAY, Minley Manor Gardens, Farnboro', Hants.

GARDENER (Head or good single-handed); 12 years' experience in all branches; age 24; single; excellent characters from past and present situations.—Apply J. W., Covers Road, Claygate, Surrey.

GARDENER (Head) where three or four are kept; life experience in all branches; age 40; married, two children; good references.—Address J. DENTON, Up Down Hill, Windlesham, Surrey.

GARDENER (Good Single Handed, or with help); 15 years' experience on vines, tomatos, chrysanthemums, &c.; kitchen and flower garden; married; age 31; one child; good character; abstainer.—W. MARTIN, 5, Langroyd Road, Upper Tooting, S.W.

GARDENER (good Single-handed, or with help); 14 years' experience in all branches; age 30; married; excellent characters from past and present situations.—Apply C. W., Ripley House, Ripley, Surrey.

GARDENER (good Single-handed); 18 years' all-round experience; would not object to horse; wife, housework; no family; two years and eight months present place. —CLIFTON, 87, Melville Road, Stonebridge Park, Harlesden, N.

GARDENER (Single-handed, or with help); age 32; married, two children; 18 years' experience in vines, tomatos, cucumbers, melons, flower and kitchen garden, greenhouse, lawns; good character.—T. BARKER, 1, Harvey Gardens, Harvey Road, Leytonstone, Essex.

GARDENER (Single-handed or otherwise); age 25; 11 years' experience Inside and Out; good character —D., The Lodge, Walton, Epping, Essex.

GARDENER (Under); age 20; four years' experience, Inside and Out. Inside preferred. Well recommended.—E. WOTTON, Greenham, near Wellington, Somerset.

GARDENER (Under) SEEKS SITUATION; age 20; or as third in a gentleman's garden; can have good references.—Apply A. G. ELVY, 45, Military Road, Canterbury.

GROWER; aged 32; single; life experience in grapes, peaches. tomatos, strawberries, chrysanthemums, &c., for market; also the packing of same; ten years in last situation.—C. S., 44, Cromwell Road, Grimsby.

RICHARD SMITH and CO., beg to announce that they are constantly receiving application from Gardeners seeking Situations, and that they will be able to supply any Lady or Gentleman with particulars, &c.—St. John's Nurseries. Worcester.

SINGLE-HANDED GARDENER, where boy is kept; honest, sober (abstainer preferred), and active; must understand glass; highest references; state age and wage. —Apply W. SYKES, Esq., M.D., Bury Place, Gosport, Hants.

WANTED SITUATION as GARDENER Single Handed; six years in present situation, leaving through death; age 29; married; one child; abstainer; highest references.—G. S., Stables, Homefield, Bickley, Kent.

YOUNG LAD, 19 years, SEEKS SITUATION as Improver; three years' excellent character; inside preferred.—T. X., 32, Queen Street, Wolverton Road, Stony Stratford.

YOUTH SEEKS SITUATION in gentleman's garden, where he may obtain a thorough knowledge of gardening; three years' good references.—Apply E. A., Alma Terrace Gardens, York.

Situations Vacant.

Advertisements under this heading are charged 2s. 6d. for Four lines (32 words), and 6d. per line of eight words after.

WANTED, young MAN, to look after Small Garden and one horse; would be required to drive; good references required.—Apply in first place, GEORGE PRINCE, Rose Grower, Oxford.

WANTED, a young MAN as Under Gardener, Inside and Out, and attend to fires; age from 18 to 20; state wages.—Address W. CANT, Garratt's Hall, Banstead, Surrey.

WANTED at once (for two months or longer) a strong, active LAD, accustomed to work in kitchen and flower garden.—Apply, stating age, wages, &c., T. CUTTER, Cookhams, West Hoathly, Sussex.

WANTED, GARDENER and GROOM (one horse); glass work, and small flower garden; state wages and experience —R. J. W., 289, Goldhawk Road, London, W.

WANTED, Young MAN, for outdoor work, and to fill up time under glass; one used to a horse preferred.—H MOSES and SON, Florists, Devonshire Road, Greenwich.

DEATH.

SPOONER.—On the 3rd inst., at his residence at Hounslow, Mr. STEPHEN SPOONER, of the Hounslow Nurseries, aged 75.

NOTICE TO ADVERTISERS.

Owing to the continued increase in circulation, the "Gardeners' Magazine" now goes to press on Wednesday. No advertisement can be guaranteed insertion, or altered, unless received before Four p.m. on that day.

NOTES OF THE WEEK.

EVOLUTION OF THE CULTIVATED STRAWBERRY.

IN an endeavour made at Manchester a few days since to vindicate the claims horticultural and botanical societies have upon the community, Sir Trevor Lawrence stated that they could best estimate the value of their work when they remembered that the fine strawberries now in cultivation originated from the small wood strawberry. As the gathering at which this observation was made was of a festive character, no authorities were given in support of the statement, or questions raised, and it therefore becomes a matter of some importance to inquire how far it is justified by the facts of the case. It is no new thing to be told that the ancestor of the British Queen, Royal Sovereign, and other strawberries in cultivation is our woodland wilding, and that the present race which yield such abundant supplies of large and luscious fruits prove to demonstration the splendid results that may be obtained from well-directed manipulative skill. We have on more than one occasion been present at functions where the strawberry has been used "to point a moral," and if we have allowed the statements made to pass unnoticed, it has been because we are fully aware that gentlemen engaged in commerce not associated with gardening are not usually regarded as authorities on horticultural matters. In the case of the President of the Royal Horticultural Society a very different state of things obtains, and such statements are likely to be accepted without question even by those who possess a somewhat intimate acquaintance with both the practical and scientific aspects of gardening. Hence the necessity for drawing attention to the fact that the origin of the cultivated strawberry, as suggested at the Manchester and some other gatherings, is nothing more than a very pretty myth. The development of the strawberries now at the command of the cultivator affords an excellent object lesson in plant improvement; but there is not a scrap of evidence in support of the views of those who believe them to be descendants from the wood strawberry (Fragaria vesca). This species may be capable of improvement, but the fact remains that it has not undergone any change since Tusser advised nearly three and a-half centuries ago the planting of strawberries found "growing abroad among thorns in the wood." Nor has its pollen been used with any known effect in the fertilisation of other species. It was for a long period cultivated in gardens, when, according to Parkinson, it was "bettered by the soyle and transplanting," but this improvement was simply increased vigour due to a more fertile soil. It may be regarded as surprising that no attempts should have been made to raise a new race by the inter-crossing of the wood strawberry and the Virginian strawberry (F. virginiana), which was introduced early in the seventeenth century; but this does not appear to have been done, for no improved varieties were obtained, until after the introduction of the Chili strawberry (F. chiloensis) and the pine strawberry (F. grandiflora) in 1727 and 1759 respectively. After the last named, which is supposed to be a hybrid between the Virginian and Chili species, had become generally known, the raising of seedlings appears to have received considerable attention, and from that time the work of improvement has steadily progressed. The cultivated strawberry, it will be thus seen, is a quite modern product of the gardeners' art, and consequently there are no mysteries in connection with its origin, or occasion for doubt with regard to its progenitors.

CACTI.

THE large collection of flowering specimens of phyllocacti at the Temple must have opened the eyes of many people to the merits of these plants from the purely floral points of view, since amid a very galaxy of glorious blooms they held their own, and vied with the best. The popular idea of the cactus family is that it consists of a number of curiously spiny fleshy individuals, like crosses between a furze bush and a cucumber, varied occasionally by flattened jointed specimens, indicating faint attempts at leafage. That they bear some sort of fruits is recognised by a few who have made the acquaintance of the prickly pear, and here and there in sunny country cottage windows the creeping cereus and antiquated specimens of the phyllocactus itself have long been regarded as plants which now and again present their owners with a blossom or so to the general wonderment of beholders. The interesting side of the family, apart from its blooms, was very fairly represented by a large collection at the back of Messrs. Veitch's phyllocacti, where at least a hundred different forms of the prickly, hairy, and spiny species were shown in capital condition; with one or two exceptions, however, they upheld the popular idea of bloomless curios, and hence it was difficult for the outsider to believe that a single species out of the many could be persuaded to develop the gorgeous array of blossom presented on the other side of the same stand. The fact of their connection, however, being recognised, the question presents itself whether other species, if taken in hand in a similar skilful fashion, would not still further enrich the world of horticulture. The opuntia, or prickly pear itself, bears beautiful pale yellow blooms, a colour absent in the phyllocacti shown, and we have a vivid recollection on one occasion of beholding a huge bush of this species in its native habitat, so densely covered with its primrose inflorescence as to resemble an azalea with abnormally large blossoms. This must have been an unusually floriferous sport, as only one example among myriads of plants was seen, but none the less does it indicate a possibility. Then, too, with the examples of bigeneric orchids before us, the cacti might yield like results with like handling, and so widen the range of colour and form, which at present is very limited. The culture of cacti is in some respects extremely easy. They are the evolutional offspring of drought and sunshine, coupled with a minimum of root nourishment, and hence under culture they survive and even thrive the better for that neglect of the watering can, which often proves so fatal to indoor plants. It, however, by no means follows that a little attention will not be repaid, and we may be perfectly sure that the grand display produced by Messrs. Veitch was not arrived at altogether on the "let alone" system. The native countries of the cactus have their wet as well as their dry seasons, and the secret of success lies doubtless in due observance of this fact, since Nature is ever the best teacher.

IMPORTS OF FRUITS AND VEGETABLES.

WE have again to record the fact that the Board of Trade returns are less satisfactory than could be desired, for with an increase in the value of the imports there has been a material drop in the exports. The increase in the value of the imports during the past month amounted to £1,360,030, or 3·7 per cent., and the decrease in the exports to £1,430,792, or 7·4 per cent. The decreases in the quantities of the products of the orchard and gardens are more marked than for several years past, and the only increase in the specified fruits and vegetables which can be successfully grown at home is in the imports of potatos. The imports of apples amounted to 97,400 bushels, of the value of £49,946, against 123,928 bushels, of the value of £55,223, in the corresponding month of last year. The drop in the imports of cherries is very marked, for we only received 10,385 bushels, of the value of £10,882, as compared with 56,278 bushels, of the value of £45,020. The supplies of grapes from abroad appear to keep fairly steady, and last month we imported 3,228 bushels, of the value of £5,164. The value of the various nuts used as fruit is returned as £44,390, or an increase of £24,480 as compared with last year, and of about £4,000 in 1896. Pears dropped in quantity to the extent of six bushels, and in value to the amount of £229, the actual quantity and value being 496 bushels and £118 respectively. But few plums were received from foreign orchards, the aggregate having been 91 bushels, of the value of £149, against 3,843 bushels, of the value of £3,057, last year. Unenumerated fruits show a decrease in quantity of nearly 1,000 bushels, and an increase in value of about £3,500, the aggregate having been £88,573 bushels, of the value of £56,078. The imports of potatos were again very large, the total being 1,055,256 cwt., as compared with 385,640 cwt. last year. Of this large quantity we received 484,317 cwt. from Germany, against rather more than 1,000 cwt. in 1897, and 10 cwt. in 1896. France sent us about 30,000 cwt., and the Channel Islands over 100,000 cwt. less than last year, owing probably to the comparative lateness of the spring. The increase in values has not been in proportion to the augmentation in supplies, for while the latter were nearly doubled, the value is returned as only about one-third more. Onions again indicate a decrease, only 352,399 bushels having been received, against 463,939 bushels last year; the values in the two years being £60,889 and £72,578 respectively. It is satisfactory to observe that there has been a considerable appreciation in the value per bushel, and the prices now ruling are sufficient to justify a considerable extension in the home cultivation of these esculents.

The Spanish Genista (*G. hispanica*) has for some weeks past been one of the most showy of shrubs, and even at this date, in spite of continued wet weather, it is a golden glory. There are several fine spreading masses on the higher rockwork in the Rock Garden at Kew, so densely flowered that scarcely anything but the golden colour is visible. A correspondent, writing from North Wales, states that two large masses, each four feet across, have been a great attraction just outside the London and North-Western station at Abergavenny. We agree with him that the species is one of the most effective and beautiful of early flowering shrubs, and, as it lasts a long time when cut and placed in water, it deserves to be more extensively cultivated. The Spanish genista has been grown in British gardens since 1759, but its value is not yet fully recognised except for large rock gardens, where it is generally used with advantage, and always provides an early summer display flowering during May and June.

Autumn Fruit Show.—The Royal Horticultural Society's exhibition of fruit to be held at the Crystal Palace on September 29, 30, and October 1 will include a section for market gardeners, and if there is a spirited contest for the prizes the produce will constitute an interesting feature. In the division open to market gardeners only there are four classes for grapes, one of which is for Black Hamburgh, and in these classes the fruit is to be shown in single layers, weighing not less than twelve pounds. There are seven classes for apples, to be shown in baskets or boxes, two for pears, three for plums and damsons, and one each for peaches, cobs or filberts, tomatos, and melons. Another new feature is the provision of classes for collections of apples and pears to be grown in specified zones, but the prizes appear to us to be insufficient to promote a brisk competition, except in the case of growers resident in the counties within a short distance of the metropolis. One class in the section is for six dishes of apples, four cooking and two dessert, and the other for six dishes of dessert pears, and these are repeating ten times, making twenty classes in all. In this section the Kentish growers will compete among themselves, but the other English zones contain from six to eight counties, while the Welsh, Scotch, and Irish growers compete in the classes provided for the respective countries. The sections in which the competition is open to cultivators in all parts of the United Kingdom are similar to those of previous years, and consequently both collections and single dishes have ample provisions made for them. The classes, rules, and advertisements are mixed up in the schedule in a manner that to our mind is highly objectionable in publications emanating from the leading horticultural society of England.

Fruit Culture in Wurtemberg.—Mr. T. R. Mulvany, in discussing the present condition of the rural industries in Germany, states that in Würtemberg fruit culture is carried on with much success. Nowhere in Germany has he seen finer orchards and fruit trees than in Würtemberg. The income from fruit is one of the chief items in the farmers' books. It reaches an average of £400,000 per annum. Some parishes realise several thousand pounds sterling from cherries alone. However, most money is derived from the apple; the greater portion of the apple and pear crop is devoted to the making of cider and perry, only a few varieties, not suitable for liquor, being sold or dried. It is a remarkable fact that all the home-made wine and cider is drunk in Würtemberg; this is regarded by Mr. Mulvany as a proof of how little the people suffer from poverty. The farm hands and country-folk all drink wine or cider, and the consumption of gin, whisky, and brandy is very small indeed.

The Dutch Horticultural and Botanical Society does not make its awards broadcast, provided its work during March, April, and May is an indication of its sound methods of procedure. There was a meeting each month, and five plants, in all, were certificated, four only gaining the highest awards. The latter were Primula vera acaulis cœrulea, Cineraria Lynchi, Plantago lanceolata variegata, and Eulophiella Elizabethæ. Vanda or Stauropsis gigantea gained a certificate of merit, and, like the eulophiella, was shown by Baron van Boetzelaer, of Maartensdijk.

A Viola Trial on a Large Scale is being held this year by the Royal Horticultural Society at their Chiswick Gardens. A border wide enough to afford room for six plants in a row has been provided, and this border has a run altogether of about a hundred and thirty yards. From Messrs. Dobbie and Co., Forbes, Crane, and Cocker, about two hundred varieties have been received, but probably there are not more than a hundred and fifty distinct forms. At present the plants, having been planted, are thriving amazingly, owing to the cool moist weather and the few flowers already produced are of fine size. It is, of course, too early yet to discuss the merits of the varieties for bedding and general garden use, but we draw attention to the trial because it is one of the most complete ever held, and one that should be of great interest to southern growers, because of the hot, dry climate of Chiswick. Varieties that come through this test successfully are likely to become extensively cultivated in the south of London, whatever their merits or demerits elsewhere.

Orchid Hybridisation is one of the most fascinating of pursuits, whether taken up with a view to profitable returns or merely as a hobby. Since John Dominy raised the first hybrid orchid many years have passed away, and not a few men have risen to horticultural fame by reason of their achievements in crossing species or intercrossing hybrids. Among those who have taken special interest in orchid cultivation, introduction, and hybridisation, scarcely any are better known than Mr. James O'Brien, V.M.H., who has been the hon secretary of the R.H.S. Orchid Committee since its formation, and who knows orchids at sight better probably than any man living. With such a wide knowledge, and opportunities for seeing new hybrid orchids, Mr. O'Brien should place a most interesting account before the Fellow of the Royal Horticultural Society on Tuesday next, June 14, in his lecture entitled "Hybrid Orchids." The lecture commences at three o'clock, but the committees meet as usual at noon. On this occasion, the Sherwood Silver Cup, for annuals and biennials decoratively arranged, will be competed for for the first time.

New Industries for Trinidad.—The usefulness of the botanic gardens and stations in our various colonies cannot be over-estimated, but, unfortunately, there is too great a tendency on the part of colonists and planters to follow old methods and put "all their eggs in one basket." To a large extent this has been the case in the West Indies, where the collapse of one industry has brought ruin to whole colonies. In an able lecture given by Mr. J. H. Hart, superintendent of the Trinidad Botanic Gardens, and published in the *Bulletin* from that establishment, a good idea of the industries that might profitably be developed in the colony is given. Mr. Hart shows that although various rubber producing trees succeed in the island, and those in the botanic gardens yield from four to six pounds of rubber per year, yet the cultivation of these has not been conducted upon any scale outside the gardens. Then, it is pointed out that while Jamaica exports logwood to the value of £300,000 a-year, Trinidad sends none to market, although she could produce quantities, and of the finest quality. No one plants either cedar or mahogany in Trinidad, and yet these grow so well on the island that were the colony transformed into a mahogany and cedar forest it would be one of the richest British possessions. Trinidad might easily grow sufficient of these woods to supply the United Kingdom. Besides these industries Mr. Hart mentions fifty other products capable of development in the colony, and his lecture shows that those most interested have largely failed to take advantage of the opportunities and advice that a well kept botanic establishment affords.

The Devon Gardeners' Outing will this year take place on July 6, the excursion being to Tavistock and Endsleigh, the latter charming establishment being open on that day to the members and friends of the Devon and Exeter Gardeners' Association, by kind permission of his Grace the Duke of Bedford, to whom the property reverted a short time since. As usual Mr. Andrew Hope, the secretary of the association, has made the best of arrangements. The party leave the Queen Street Station at Exeter at five minutes past nine, and travels by [illegible] carriages (L. and S.W.R.) to Tavistock, arriving there at a quarter to eleven. After an inspection of this historic old town, luncheon will be provided at half-past twelve, and then brakes will take the travellers to Endsleigh. On returning to Tavistock a substantial meat tea will be provided, and this will probably be followed by a short social gathering ere the journey homewards is commenced at five minutes to eight. Those intending to join this excursion should communicate as early as possible to Mr. A. Hope, 54, High Street, Exeter.

Lectures at the Chiswick Gardens will be delivered by the Rev. Professor Henslow, M.A., on June 15, 22, 29, and July 6; the meetings will be held in the Big Vinery, and commence at eight o'clock. Free admittance will be accorded to all gardeners in the Chiswick district, and we believe that its extension to the members of the Chiswick staff and the Chiswick Gardeners' Association, as there is likely to be a good attendance from the Ealing and Kew associations. In the following order Professor Henslow will give lectures upon: The "Importance of a General Knowledge of Vegetable Physiology to Cultivators"; "Origin of Cultivated Vegetables"; "Origin of the Commoner Garden Flowers"; and "Origin of Species in Nature, with Suggestions for Experiments in Variation under Cultivation." We heartily recommend these lectures to gardeners of all ages who can attend, for we are sure they will be of the highest [illegible] value, and we may add that Professor Henslow has the faculty of interesting as well as educating his hearers.

The Weather of 1897-98.—Although it may be of greater importance to know what the weather will be during a certain period than what it has been, weather records are not without value. Hence the annual report of the Astronomer Royal on the weather of the year is anticipated with considerable interest by those who devote any considerable share of their attention to meteorology. From the report issued the other day we learn that the number of hours of bright sunshine recorded during the twelve months ending April 30, 1898, by the Campbell-Stokes instrument was 1,529 out of the 4,454 hours during which the sun was above the horizon, so that the mean proportion of sunshine for the year was 0·343, constant sunshine being represented by 1. The rainfall for the same period was [illegible], being 7·21in. less than the fifty years' average. The number of [illegible] only 149. This is a very small annual rainfall; the three smallest falls during the preceding fifty years being 16·33 in. in 1864, 17·61 in. in 1867, and 17·70 in. in 1858. The winter was exceptionally mild, and throughout the year the monthly mean temperatures were in excess of their corresponding averages in every month with the exception of May, September, and March. In January the excess amounted to 5 degrees, the mean temperature for that month being 43·6 degrees, as it was also in 1875 and 1890. In the last fifty-seven years it has only once exceeded this, in 1884, when it had a mean of 43·9 degrees. On twenty-nine days only in last year did the temperature of the air fall to freezing point, the lowest temperature being 23·3 degrees on December 24. The mean temperature of the five months October to February was 44·6 degrees, as it also was in the winters of 1848-49 and 1868-69.

Primula Traılli.—With reference to the identity of Primula Traılli, George F. Wilson, Esq., F.R.S., writes: Having had another year's experience, I can now speak with certainty as to Primula Traılli. I heard from my Indian botanical friend that he had met the collector of the seed sent me as that of P. Traılli, and had shown him the gardening papers which I had sent to India, with figures of plants bloomed here; these, he said, were quite different from P. Traılli; that he had collected other primula seed at the same time as P. Traılli; that the seed was mixed, and that P. Traılli had not come up. I think the best name for the primula which I exhibited would be P. Munroi or P. involucrata major. It is utterly unlike the form of P. Munroi or P. involucrata which I have grown for years. It has, when grown close to the glass, and so free from any tendency to be drawn up, stems above eighteen inches high with long leaves. Probably several of the Indian primroses have different forms. Some years ago I exhibited before the Floral Committee of the Royal Horticultural Society a giant form of P. capitata, which, I suggested, should be named P. capitata major. This received a first-class certificate in October of 1886; and some time afterwards a nurseryman exhibited a giant form of this primrose, which, I suppose, the committee considered different from mine, as this also secured a certificate or award. The committee only followed the usual precedents in rewarding a fine, distinct, new form of primula in the case of P. Traılli, but I think that the name should be changed, and the fact recognised that P. Traılli has still to be introduced.

Dahlia Catalogue.—The National Dahlia Society, which has of late evinced signs of increased activity, has issued an official catalogue of dahlias, compiled by the President, with the assistance of the other officers and the members of committee. The catalogue contains a short bibliography of the dahlia, and selected lists of show, fancy, pompon, cactus, decorative, and single varieties. The varieties are arranged in their order of merit; and, in addition to the names [illegible] colours, the names of the raisers, year of introduction, and height of the plants are given. To facilitate reference, an alphabetical list of the varieties enumerated in the selections is provided. The catalogue will be found of much service to cultivators, more especially to those who take part in competitive gatherings. It is, indeed, so good as to have deserved a more substantial cover. Copies (price 1s.) may be obtained by non-members from the honorary secretary, Mr. J. F. Hudson, Gunnersbury House, Acton.

The Drinking Habits of Some Moths and Butterflies have been carefully noted by Mr. J. W. Tutt, and described by him in the *Proceedings* of the South London Entomological and Natural History Society for 1897. Mr. Tutt shows that several species drink far more water than they need or that is required by their tissues under any condition. Polyommatus damon has been known to sit for more than an hour motionless, except for the slight movements of sucking up and discharging the moisture almost continuously. What this internal bath may really mean we cannot even surmise. Another important factor as to this drinking habit is a strange one; the "thirsty souls" are, so far as Mr. Tutt's own observation goes, and so far as De Nicéville's and Bates' [illegible] show, almost entirely males. Why is this drinking habit confined to one sex, and why is it indulged in whilst the females are away egg-laying, or presenting the strange phenomenon of a perfectly different habit from that indulged in by their lords and masters? It is, of course, quite reasonable to suppose that, if a number of exact observations be made, females in small numbers do visit puddles, and ponds, and streams for drinking purposes. Certain it is that females come to [illegible] equally with males, but this we may take it is for food, and not for drink, and it is just in this that our difficulty lies. We know that moths and butterflies that visit sugar, over-ripe fruit, and similar dainties are of both sexes. They come, it seems, for food; but males alone seem to be attracted by pure water. Does their extra activity give them a greater need in this direction? and has, asks Mr. Tutt, a habit which was at first (and still is in a measure) a necessity become so [illegible] that excessive drinking has literally become a vice?

The Orchid Houses at Kew are now in course of reconstruction. Up to date there have been but two orchid houses open to the public, but in future there will be four, each of the same length as the old ones but narrower. This will allow the flowering orchids to be exhibited in a temperature suitable to their general requirements, and will also lessen the many difficulties that have hitherto attended the cultivation of such a comprehensive collection as the Royal Gardens possesses. During the work of reconstruction the larger orchids and those in flower are now a few in the Cape and Begonia Houses, these having been cleared of their usual [illegible] for the time being. Grammatophyllum Rumphianum, Grammangis [illegible], and Eriopsis rutidobulbon are somewhat rare orchids now carrying good spikes of flowers.

The Horticultural Club monthly dinner and conversazione will be held on Tuesday, June 14, at six p.m. The subject for discussion on this occasion is "[illegible] Culture in Fern Variation," to be opened by Mr. C. T. Druery, V.M.H., F.L.S., who will also exhibit the late Colonel James' "Nature Prints" of ferns.

A MORNING MIXTURE.

Diluculo surgere saluberrimum est.

It is over once more. It was a big function, and we were all very proud of it, for who besides our noble selves could show such another? Nevertheless, we breath a sigh of relief at seeing the back of it and settle down to a little repose after our exertions. But isn't it curious what expressions are used by the general public with reference to horticultural objects? As an evening train bore me from the Temple on the fateful Wednesday, I caught scraps of conversation between fellow-passengers, which I could only grasp the meaning of with an effort. "A rank outsider," said one, "only been out once or twice before." Dear, dear! What could this be? Ah! happy thought. It must be Acalypha Sanderi. I leaned over and informed the speaker that it had been out at Ghent. "Never heard of the meeting," was his response, and at this display of ignorance I retired in disgust.

They got out at the next station, and my benignity was restored, but another problem speedily presented itself. A man reading a newspaper suddenly looked up with amazement written on every feature. "Jeddah!" he bawled, "Why, perdition and parsnips! I drew him in a sweep and then gave him away." He looked at me, I being the only other person in the compartment, and smiling blandly I responded: "I am not quite sure, sir, that your pronunciation is correct, but Jadoo fibre." I got no farther; the man with the newspaper hurled it from him, stamped on it, flung his hat on the seat, and indulged in such violent gesticulations that I hastily conveyed my avoirdupois into the next compartment. I am still in a state of bewilderment as to why a man who has swept up a little potting material and given it away should behave like a lunatic.

Yes! it was a great show. Although dumped and lumped in the sweet old way, the "'98 Temple" will remain a stimulating memory. The Prince was not there, but Peter was. It was my first meeting with him after his enforced holiday, and I was relieved to observe that his fiery eye had regained its pride. Nevertheless, nothing could have been greater than the affability with which I observed him greeting a number of MAGAZINE acquaintances. Peter's manner said as plainy as possible to Mr. Wythes, Mr. Prinsep, &c., "We may differ on professional points, gentlemen, but we are friends for all that." Not a man of them could resist his engaging condescension.

I have to return thanks for a box of early chrysanthemums received from Mr. Lees, through the editor. It is not often that I get so far from my Midland fastness as Kew, and it was a happy chance that when I did so the box should be there awaiting me. But these beautiful combinations do come about at times. One member of the editorial household did, it is true, fill me with nervous apprehension by picturing the plants as in the last stage of premature exhaustion owing to neglect of watering pending my arrival, but either this was a dreadful libel on the person told off to look after them, or else that abashed being slipped out and dosed them with some wonderful elixir while we were tasting of the cup that cheers except when it does dyspepsia give. Any way, the plants were in jocund health, and I carried them off in triumph. The Luxian garden is now enriched with the following sorts: Ivy Stork, Piercy's Seedling, Mdlle. Masse, Harvest Home, Foucher de Cariel, and Flora.

I think we may safely congratulate ourselves on a good strawberry season. A note on page 322 raises the interesting question of artificial manures. Many of the largest market growers do not believe in artificials for strawberries, but pin their faith to a free dressing of dung at planting time. Perhaps they are not very far wrong in the main, but I have secured such excellent results from the use of sulphate of potash that I am constrained to mention it. I am a little puzzled at the indifference which is displayed towards this splendid salt. A fair, comparative trial shows its great superiority to kainit, and, on the other hand, it does not possess the serious disadvantage of costliness like the muriate. The year before last I experimented with a few rows of President, which were planted the last week in August. Sulphate of potash was dusted in at the rate of a single handful to the yard run, and another application at the same rate was made in April. The plants fruited magnificently, and were in every way superior to others not dressed.

Docketted away amongst other topics for a quiet week is that of gardeners' investments. I draw it out, dust it up, and examine it. A specimen of some interest, is it not, my friends? Perhaps someone murmurs that it would be all right if he had anything to invest, but as he hasn't, he begs to suggest green peas as an alternative subject. My reply is that the possession of money is not everything. If we haven't got it to-day we may have next week, or the week after, or the week after that. Therefore we can study the investment question in a prospective spirit; our pockets empty, but our hearts full of hope. I once heard a bewildered small capitalist plaintively declare that there were many advantages in having no money. "There ought to be," was the response, "there are many disadvantages." The most popular form of investment with most gardeners is a local florist and seedsman business. Sometimes it answers, but it frequently means that the slender capital is locked up indefinitely, while the unhappy speculator has to work twice as long as he did in a private place for two-thirds the earnings.

Next to the "florist and seedsman" attraction stands that alluring demon "bricks and mortar." And a demon it is. It appeals with tempting force to the man of small means, because it suggests something that won't break, like a bank, or run away, like a fraudulent company promoter. But if houses do not irretrievably smash, they do so piecemeal, and the bogey "repairs" is ever present. If they do not disappear *in toto*, tenants do, and with them goes the rent. In the great majority of cases small investments in house property are bad, though it may be different if the owner occupies the house himself. Strange as it may seem in view of the price at which the stock stands, there is no better investment than home railways. A friend of mine recently gave me the result of an experiment with two sums, one invested in home rails and never taken out; the other reserved for such investments as seemed promising, for instance, the purchase and sale of house property and speculation in various industrial undertakings. Though the latter yielded high profit—as much as 10 per cent. at times—the rails won easily with their steady 3 to 4 per cent. over a course of years.

I have long watched the career of the United Horticultural Benefit and Provident Society, and my principal feeling has been one of astonishment that it enjoys, comparatively speaking, such trifling support from gardeners. What are the reasons? It is an institution calculated to do immense good; why do the great majority of gardeners hold aloof? I am firmly persuaded, as I believe I said once before, that the name has a great deal to do with it. Fancy what would have happened if that tremendous institution, the Hearts of Oak, had called itself the National Workmen's Benefit and Provident Institution! It would never have kept its baby body upright under the load. Again, would the GARDENERS' MAGAZINE have been hale and hearty after sixty-five of life if it had called itself the Organ for the Propagation of Useful Information to Horticulturists? We don't as a rule like long names, and if we shorten them we can. Where we can't shorten them we often leave them unuttered, and their valuable advertisement is lost. Consider this, gentlemen, in your committees, and ask yourselves if a short, easy, yet expressive name like Gardeners' Benefit Bank wouldn't suit you better?

LUX.

ROSES AT THE TEMPLE SHOW.

THERE was a grand display of roses at this show from most of the leading trade growers of roses under glass.

In the section for groups of pot roses, Messrs. William Paul and Son, of Waltham Cross, were awarded a gold medal for a very fine collection, well staged and of good quality. Among the many varieties may be noticed: Climbers, Crimson Rambler, and Claire Jacquier; standards, Duke of York, Ulrich Brünner, Mrs. Sharman Crawford, and Paul Neron, one plant of the latter variety, which is usually despised by exhibitors, from its lack of form, bearing flowers that would have been most useful for the back row in a stand of seventy-two or forty-eight. The whole group was bordered by twelve boxes of cut roses, containing twenty-four blooms in each, a box of the yellow tea Medea being especially good. To this firm was granted an "award of merit," for a new seedling hybrid perpetual, Aurora, several pots of which were staged, a salmon-pink, something like Pride of Waltham, yet quite distinct, with thorny wood. A large showy rose, free flowering, good foliage and habit.

Mr. Charles Turner, of Slough, had a fine decorative group, occupying the end of the large tent. As usual in exhibits from Slough, Crimson Rambler was a prominent feature, trailing up the tent poles, festooned in arches, with smaller plants filling up the spaces in front. Here were to be seen some of the finest specimen plants in the exhibition, some of the best being Madame Lacharme, Juno, La France, Celine Forestier, and Marie Baumann. Of standards, mention should be made of Niphetos, Madame de Watteville, and Francesca Kruger, bearing flowers of good form and substance. Two new roses were staged in this group, a white hybrid tea, Souvenir de Madame Eugene Verdier, and a hybrid perpetual, of the Marie Finger type, Madame Abel Chatenay, both very promising.

Messrs. Paul and Son, of Cheshunt, occupied a corner of the large tent with an elegant and interesting group, having less formality in the arrangement than some of the others, straight lines being broken up by a free use of standards. Here were to be seen two seedlings, the result of crossing Polyantha Golden Fairy with Turner's Crimson Rambler. The first-named, Diana, bearing small creamy white flowers, and the second, Psyche, producing clusters of larger flowers of the shade of maiden's blush. These two varieties were Ramblers in wood, foliage, and habit, whilst maintaining the character and size of the Polyantha.

In another tent were staged collections of pot roses by Messrs. Frank Cant and Co., and Messrs. Rumsey, of Waltham Cross. The former had some plants of a new variety, Thalia, or the White Rambler, one of a set of three summer flowering climbing roses announced as "The Three Graces." The latter staged his new hybrid perpetual Mrs. Rumsey, rosy-pink, a sport from Mrs. George Dickson; evidently free flowering.

Without a doubt the finest cut roses in the exhibition came from Mr. George Mount, of Canterbury. Forming a background to the exhibit were several specimens of Crimson Rambler, blooming profusely in small twenty-four pots. The cut flowers, on long stalks, were staged in vases. These were remarkable for the size of the blooms and sturdiness of growth, and amongst the many varieties thus shown were flowers of Caroline Testout, Catherine Mermet, Mrs. John Laing, and Niphetos, which would have stood a good chance as medal blooms at ordinary mid-season rose shows so perfect were they in form and colour. The flowers of Niphetos were remarkable, standing erect on stout stems without any support. Indeed, one or two blooms of this variety seemed more like Devoniensis in texture and shape, and for a time puzzled the judges as to their name. Besides those on long stems were cut blooms staged in seven twenty-four boxes. Four of these boxes contained respectively Anna Olivier, Catherine Mermet, Mrs. John Laing, and Ulrich Brunner; in another box were staged twelve Catherine Mermet and twelve Niphetos arranged alternately; and two other stands contained miscellaneous varieties. It was a lovely group.

JOSEPH H. PEMBERTON.

DOVER HOUSE.

THE horticulturist who has time to do much visiting will have far [illegible] ere he finds a more up-to-date and smartly-kept establishment than that of Dover House, where Mr. J. F. McLeod is the able gardener and steward to J. P. Morgan, Esq., a gentleman of great wealth and keen horticultural tastes, and one well known on both sides of the Atlantic. Dover House is situated just outside London, on the highest part of the little village of Roehampton, that nestles snugly on the northern edge of that fine open expanse comprising Wimbledon Common and Putney Heath. Although the family is not often in residence here, yet everything is kept trim and tidy as though the generous employer were at home. Weeds are nowhere to be seen, save on a part of the lawn sward, and from here they are being ousted by applications of lawn sand.

A walk through the gardens a few days ago revealed the promise of a rich crop of fruits of all kinds. The cherries, not too closely trained to the fence, but given some headway, were a mass of snowy blossoms, and here they never fail to yield a good crop. Pears were flowering profusely, and on the walls had set their crops. Apples, both long-established and newly-planted trees, promise well, while the large collection of a hundred varieties of gooseberries will this season give some indication as to the value of certain sorts as compared with others for this district. The strawberries could not be better, and it is to be hoped that unkind weather will not falsify present promise. Early peas look first-rate, especially in the sheltered kitchen garden on a southern slope. Broccoli has been a great success this season, but the crop is practically finished now; near by is a notably even breadth of the [illegible] Ellam's Dwarf cabbage, perfectly true, and with not a bolted plant visible. The asparagus beds at Dover House are wonderful examples of what continuously careful cultivation following a proper commencement may accomplish in the way of large crops of fine heads of this delicious vegetable. When one talks of the merits of alternate husbandry, and the value of rotation of crops, Mr. McLeod points out a plot of ground that for the sixth consecutive year is cropped with carrots, and surely, if present appearance counts for anything, as fine a set of roots as ever came from the plot will result this season. Mr. McLeod has great faith in farmyard manure, and his faith is seen in his works.

Among hardy flowers, roses are grown in large numbers, but [illegible] violas, and carnations outnumber them completely. In their [illegible] violas are always an unqualified success at Dover House. The [illegible] success is farmyard manure and deeply-worked soil; after this [illegible] plants are the chief requisite, and then the water-can and Dutch [illegible] the tools most called into use. On a large border the violas are [illegible] in variously shaped masses, so that when in flower there are [illegible] contrasts and pleasing harmonies making up a charming whole. The carnations are very abundant, and as healthy as everything else [illegible] gardens. Large quantities are needed for cutting from, and so the Crimson Clove, Gloire de Nancy, Raby Castle, Prince of Orleans, and many other notably free-flowering and distinct kinds are cultivated on a large scale, while rarer sorts find a place and their capabilities tested. Wistarias and magnolias clothe some parts of the comfortable mansion; roses ramble over gateways and arches, forming wreaths of fragrant blooms in summer time; choice shrubs, both deciduous and evergreen, adorn the shrubbery borders; some fine specimen trees, notably cedars and purple beeches, limes, and chestnuts, adorn the grounds; and at present a fine display of tulips and wallflowers in the flower garden are con[illegible] cluding a successful season. Bedding plants are provided in [illegible] for this compact establishment has a capacity greater than one [illegible] supposes. Begonias, pelargoniums (ivy-leaved and zonal), [illegible] humeas, cannas, and a whole host of other subjects are [illegible] hardened off for duty where colour and grace are needed.

The glass department is fairly extensive, and plenty of work is found for seven men. Fruit naturally takes much of the space; peaches and nectarines being especially plentiful; the crops throughout are as large as is consistent with good management, the trees are pictures of health, and the ripening crops are of nicely coloured fully developed fruits. [illegible] Sovereign and Viscomtess Hericart de Thury strawberries are [illegible] forced, and supplies have been provided for many weeks past, while later batches will meet the demand until the out-door crops commence. The vineries are a pleasant sight, the growth and foliage and set [illegible] all first-rate, such as do not call forth apologies or regrets from the [illegible] *de Jardin*. Figs, both in pots and planted out always respond [illegible] to the treatment accorded by Mr. McLeod, and do him great [illegible] Stove plants of many kinds are cultivated, and the collection contains many choice and rare subjects. Flowering plants in variety fill up a large greenhouse, and from here they are drafted to do duty in [illegible] wherever else necessary; spiræas, cliveas, cytisus, lily of the valley, [illegible] carnations figure largely. The rose house is not an amazing success, [illegible] reason of its heavily wooded, old-fashioned roof, and bad situation; [illegible] contains a lot of rose blooms, but the total results do not please [illegible] McLeod, so doubtless ere long it will be removed, and a more [illegible] building erected on a more suitable site. The Malmaison carnations at Dover House are worth making a long journey to see, [illegible] about the date of the Temple show they will be at their best. [illegible] nations are a keen test of a plantman's skill, and out of the test McLeod has come off more than victor, as at least one gold [illegible] testifies. There are a goodly number of specimens in fourteen-inch [illegible] some measuring nearly a yard across, and carrying from twenty to [illegible] fat buds, that ere long will be huge bright blooms. The foliage is [illegible] derfully healthy, and disease obtains no footing; the largest examples are two and a half years old, and were not potted last season. [illegible] houses are smaller, stocky, and equally healthy plants of Malmaison [illegible] nations, and the newer sorts that have been obtained by crossing the [illegible] to obtain higher colour—Churchwarden, for example—and [illegible] veloping sturdily

C. H. C[illegible]

LILIES AND THEIR REQUIREMENTS.

The introduction of Eastern and Western lilies has entirely transformed the aspect of our gardens. This is especially expressive of the influence exercised by such noble species as Lilium candidum, L. auratum, and L. speciosum, not to speak of L. chalcedonicum, L. pardalinum, L. longiflorum, and L. excelsum ; all of which and many others of equal endowment, such, for example, as L. giganteum and L. szovitzianum, have proved themselves capable of producing splendid artistic effects. Such flowers as anemones, irises, violas, and aquilegias are admirable in their spheres ; most of them are at once richly odorous and highly ornamental ; but they have not the majestic elevation and dignity of the altogether imperial lily, whose only serious rival is the rose. I do not hesitate to assert that it gives its cultivator, when once it has been established, infinitely less trouble than any of these. A great many flowers are either delicate or capricious, and require constant attention, especially in late spring and early summer, if they are even to have the privilege of existence. Some of them, such as the tulips, are so weakened by heavy rains and their hardening influence upon the soil, that when their flowering season arrives they make no effort in this exquisite direction, but merely send up foliage without any bloom ; while others, such as the phloxes and montbretias, are sometimes shattered in a single night by the sudden advent of the frost.

But the lilies which give grace and distinction to our gardens are of a different constitution from this. Three years ago the tropical form of one of the tenderest of Japanese liliums, L. longiflorum Harrisi, triumphantly survived the hardest winter I have ever experienced ; though it should be added that the effect of that crucial period on vegetation of every description was greatly mitigated by an unprecedentedly heavy fall of snow, which, by reason of a strong drift, was in my garden eight feet deep, and lay there for two months ere it was entirely melted by the sun.

Only a few lilies, mostly of Indian origin, require the conservatory ; among these are L. Wallichianum, somewhat akin to the longiflorum family, but of less vigorous nature (this variety must not be confounded with Wallichianum superbum, now commonly called "sulphureum"), Lilium Lowi, and L. nepalense, which require bottom heat to start them into activity, and are not more beautiful than their stronger contemporaries, which, if only assigned an adequately sheltered and congenial situation, luxuriate in our gardens. Of the latter, which constitute, most fortunately, the vast majority, one of the grandest is Lilium giganteum, a native of the Himalayas, which must be grown from an offset for several years to ensure its full capability of abnormal growth and bloom. Some of the finest specimens of this imposing lily I have ever seen I saw some years ago at the Royal Exotic Nurseries, King's Road, Chelsea, but I have no doubt that they had been in the first place grown in the open air. The strongest lilies are as a rule marvellously accommodating. I have often thus transferred splendid specimens of auratum, longiflorum, and speciosum from their place in the open garden to the staircase window of this house when the plants were just coming into bloom, with gratifying facility and perfect success. In such instances, however, it is very advisable to keep them shaded as much as possible for several days, till they have become harmonised to their altered environment ; otherwise some considerable extent deterioration may result. If not sufficiently supplied with water they will also inevitably suffer much. Lilies, as a general rule, are not very exacting in the matter of soil, provided it is not defective in drainage—a consideration of the greatest importance, especially during the winter months—or too cold and adhesive to satisfy their requirements. A large number of them are partial to a loamy soil, or one which is considerably impregnated with peat, which is perhaps of all substances the most favourable to fibrous production and root-formation. They are also much benefited by a considerable application of sea sand, which ensures moisture in summer when the ground is parched and dry, and during the floods of winter preserves the bulbs and tender roots from deterioration and possible decay. During the latter exacting season I once lost the finest Lilium giganteum I ever possessed by planting it too near the surface, and not giving it an adequate amount of preservative sand. I find that in my own garden the so-called Persian Lily (L. monadelphum szovitzianum) which is really, as Mr. Baker can tell us, a Martagonian native of Turkey in Asia, is a striking exception to the general rule, and did not realize my sanguine anticipations regarding its potentialities, until it was transferred from its original position in ordinary loam of a somewhat light description and planted in clay. This experience of one of the stateliest and most commanding in its aspect of all lilies, entirely corresponds with the opinion of Mr. Nicholson, of the Royal Gardens, Kew.

Dr. Wallace, of Colchester, whom I have always regarded as one of the greatest living authorities upon this special subject has told us that Lilium auratum, whose decorative value can hardly be over-estimated, and whose adequate culture is, therefore, a matter of primary importance, "likes a top-dressing of dry clay broken very small." If so, it must have something of the nature of Lilium szovitzianum. The latter stately lily is cultivated at Rochester Deanery with remarkable success by the gifted president of the National Rose Society ; and it was my intention to have obtained from him ere this, for the sake of comparison, his opinion of its requirements. There is little difficulty connected with the cultivation of the various members of the great Martagon family (or sub-genus, as each division is botanically called). Lilium pardalinum, indeed, is somewhat arduous to establish, according to my experience, for some of my plants of this justly-admired Californian lily, though planted two years ago, have not yet achieved anything worthy of being recorded, either in the direction of growth or bloom ; but I have some hope that my long-enduring patience (which is amply sustained by other and greater consolations), may be amply rewarded by this time next year. I am the more hopeful of this as Dr. Wallace has described it as being, when thoroughly naturalised, one of the finest existing lilies for garden cultivation. With other famous species from various regions of the world, such as Chalcedonicum (the "Scarlet Martagon"), Dalmaticum, Monadelphum, and Humboldti. I had at first a similarly tantalising experience ; now they are among the grandest ornaments of my herbaceous borders, Lilium dalmaticum reaching a height of eight feet and bearing upwards of fifty flowers. I should think that this species and the beautiful white Martagon would present a striking contrast if grown side by side. Lilium chalcedonicum, by reason of its brilliant complexion, would also associate admirably with these.

The most interesting longiflorums of recent introduction are L. Takesima grandiflorum and L. formosanum, the latter having been introduced, as its name sufficiently indicates, from the island of Formosa. Each of them possesses what may be termed individuality or distinctive characteristics ; but they have not the vigour of Wilsoni or Giganteum.

DAVID R. WILLIAMSON.

NARCISSUS TRIANDRUS AND ALLIED FORMS.

OF wild narcissi at present known and cultivated here and on the Continent, this small group contains undoubtedly the most interesting and pretty species. Unfortunately they will, I am afraid, be never very popular, on account of their difficult culture, rarity, and slowness of propagation. N. triandrus and N. cyclamineus are good seed bearers, and can also still be procured from their native habitat ; but N. calathinus and the form N. concolor are very rare, and the supply is very uncertain, while I doubt whether N. triandrus pulchellus has been found wild during the last twenty years. The best way of growing these forms is to plant them in sheltered spots on the rockery or in borders in clumps. When once doing well, do not disturb them for several years, and then immediately replant them early in summer. All are well adapted for pot culture.

N. triandrus reflexus has small globular bulbs about half an inch in diameter ; the leaves are slender, channelled, linear, and deep green; peduncle about eighteen inches high, bearing from one to twelve flowers ; the flowers are drooping ; perianth about one and a quarter inch long ; segments lanceolate, reflexed ; corona cup-shaped, the colour being pure white. The anthers are variable in length, and usually three shorter ones and three longer ones, and style exserted ; hence, by some oversight, Linnæus thought it had only three anthers, and named it erroneously N. triandrus, but the more appropriate name is N. reflexus. When well grown it is certainly a very desirable plant, but few seem to succeed with this species. Here, at the Hale Farm Nurseries, we grow it in a good loamy soil, planted about six inches deep, and leave the bulbs without disturbance for three or four years. The position is sheltered and half shady : also does well in purely peaty soil. It is a native of Spain and Portugal.

N. triandrus concolor is a Portuguese form, with pale yellow flowers ; it is, however, a very rare plant in English gardens. N. triandrus pulchellus has flowers very much smaller than the preceding, and it seems to be now almost extinct, judging by the few specimens one meets now only in a few collections, and I have no knowledge of its having been found recently as a wild plant. The peduncle of this species is unusually stout, about eighteen inches high, pedicels rather long, segments yellow, and the corona whitish or pale sulphur. N. triandrus calathinus, described in "Redonté's Liliaceæ," is a very local plant of the Isle of Glennaus, where it is found growing round the coast among grass. It differs from N. triandrus in the broader leaves and the much larger and somewhat bell-shaped flowers, the colour being almost pure white. As it grows early, it is liable to be injured by frost, and should therefore be planted in sheltered spots, or grown as a pot plant and kept in a cool frame. It is a very handsome and uncommon plant, rarely met with, and then only in small numbers. This is a fine subject for cross-fertilisation. There are at present a small number of white hybrid trumpet narcissi here and on the Continent, the product of this and Ajax forms, which, when more plentiful, will be eagerly secured by lovers of narcissi.

N. cyclamineus is, in shape of bulb and leaves, closely allied to the above. The flowers are drooping, one to one and a half inches long, segments reflexed, with corona of same length, crenate, golden yellow. This species requires the same treatment as N. triandrus, and when once doing well in any particular place, I should not advise moving it, especially as it increases but slowly by offsets or seeds. N. Johnstoni is probably a natural hybrid between N. cyclamineus and a yellow Ajax form, being intermediate between the two, especially as in the pretty form Queen of Spain, where the segments are slightly reflexed, though not so abruptly as in either N. triandrus or N. cyclamineus. The typical N. Johnstoni has primrose-yellow flowers, and Queen of Spain has deep golden-yellow flowers ; the former is, however, a rare plant, while the latter is fairly plentiful.

G. REUTHE.

Hardy Flowering Trees.—The wonderful and beautiful flowers seen everywhere recently on apple trees, apart from what they signify in fruit production, prove that fruit trees give us beauty that cannot at this time of the year be over-estimated. But we have so many trees non-fruiters, that bloom freely also, and in positions not generally assigned to apples, that too much can hardly be made of them in their seasons. How wondrously floriferous have been the double-blossomed cherries. I have seen trees of these, large-spreading examples too, literally masses of snowy whiteness, such as no other flowering tree could excel. The pretty tinted cherry, Cerasus Watereri, has also been of lovely form, and in various directions a pendulous cratægus has been lovely. How pure and beautiful, too, have been some of the Pyrus tribe. Now the laburnums and coloured thorns are rich in beauty ; also the horse-chestnuts, the robinias, and the high-coloured Judas tree, with many others. All these things merit wider planting.—A. D.

NEW FRENCH ROSES.

FOR a very long number of years I have in one way or another chronicled the advent of the new French roses. I used at one time annually to pay a visit to Paris to see for myself, if I could, what the novelties were. I had many a pleasant chat with old Margottin, with Verdier, Lévêque, and others; and once or twice I went down to Lyons. I do not know that I ever gained much information at Paris except on one occasion, when I was the first Englishman who saw Maréchal Niel; but generally I was told that there had been a thunder storm, and the roses were all "abimées." During those years (more than forty) very great changes have taken place, many of the old rose growers have passed away; Charles Verdier, Margottin, Lacharme, J. B. Guillot, Gounod, and Schwartz, no longer are engaged in the pleasant and profitable occupation of raising and sending out seedlings. But what wonderful flowers they have left us. Will their successors—for some of them have successors—be ever able to give us anything that will surpass Marie Baumann or A. K. Williams, or such teas as Comtesse de Nadaillac or Souvenir d'Elise Vardon? I very much question it. Then, again, I see not only change in those who send them out, but also in the character of the flowers raised. We used to be flooded every year with a great quantity of hybrid perpetuals, good, bad, and indifferent; but now they are few in number, and the prominent place they once occupied is now taken by teas and hybrid teas. It seems as if they thought that they had got to the end of their tether, as far as H.P.'s are concerned, and finding that a new class of hybrid teas had been pushed forward into notice, they had met the implied demand by going in very much for these; and it is a somewhat curious fact that many of the new varieties have been produced from hybridised seed, of which Lady Mary Fitzwilliam, a popular English rose raised by the late Mr. Henry Bennett, was one of the parents.

Of hybrid perpetuals only seven new ones are announced, while of teas there are thirty-two, and of hybrid teas there are ten; this is entirely reversing the former state of things. We used also formerly to see many of the new announcements in the stands for new roses at our national exhibitions; but here again is a new order of things, for since our home growers have raised so many excellent flowers most of these stands are filled with British instead of foreign raised roses. The descriptions are all grand, and the colours announced truly marvellous, but the only guide that we can really have is the character of the raisers and what they have done for us in former years.

Hybrid Perpetuals

Of these, as I have said, there are seven; they are:—

Comte de Montebello (Lévêque); it is described as brilliant cerise-red (of which we have plenty), a large flower and full.

Comte Raoul Chandow (Lévêque); a well-formed flower, vermilion-red shaded with brown.

Comtesse de Greffulke (Lévêque); this is described as a reddish brown shaded with vermilion and purple, a curious combination of colours, but large and full.

Comtesse Renée de Bearn (Lévêque); dark carmine shaded with dark purple, reflex of the petals scarlet.

Louise Muller (Dr. Muller); bright red, borne in clusters, and continuing in flower throughout the season.

Oscar Cordel (P. Lambert); cup-shaped flower, of a clear, bright carmine, very free flowering.

Souvenir de Pierre Oger (A. Oger); a large globular-shaped flower, with large petals of a very bright, beautiful rose colour.

It will be seen from this short list that the greater number come from one firm, which has sent out year after year a number of new flowers, but of these there is but one which remains permanently in our exhibition lists—Suzanne Marie Rodocanachi; two others, Devienne Lamy and Comte de Paris, have had their day but are now superseded.

Teas and Noisettes.

Amélie Pollonais (Nabonnand); glossy light rose, the centre a deeper shade.

Auguste Waltinne (Soupert and Notting); large flower, very full, brick-red, shading off at base to yellow.

Baronne Charles Taube (Ketters); large full flowers, yellowish white, shaded with rose.

Baronne M. de Tornaco (Soupert and Notting); large and stout petals, mother-of-pearl white, reflex of petals golden shaded with very light rose and edged with carmine.

Catharine Gerchen Freundlich (Ketten); outside carmine, rose centre, streaked with coppery red.

Comtesse Gideon de Clermont Tonnerre (Soupert and Notting); brick red, veined with golden yellow, centre dark peach red, reverse of petals orange yellow, colour very variable.

Duc de Carghis (Vve. Schwartz); very large petals, magenta red, sometimes darker, shaded with cream and canary yellow.

Emilie Gonin (P. Guillot); very large well-formed flower, white, tinted with orange yellow, much darker at base; each petal largely bordered with carmine rose. This variety received a gold medal at the Lyons exhibition of 1895.

Fanny Stolwerk (Nabonnand); a very full flower, salmon-rose, shaded with peach rose.

Frau Thérèse Gluck (Gluck); the outer petals dark red, centre of a new shade.

Général Billot (Dubreuil); outside pale amaranth, reflex amethyst, centre purplish crimson.

Gloire de Deventer (Soupert and Notting); creamy white, reverse of petals light rose, darker in centre.

Grande Duchesse Olga (Lévêque); a very well formed flower, of a beautiful creamy white.

Herzogin Marie von Ratibor; well-shaped, creamy white, sometimes of a darker shade, reddish in centre.

Jeanne Forgest (Forgest and Bonnaire); flowers produced singly, outside petals very large, light yellow; centre golden yellow, shaded with rose.

Joséphine Dauphin (Liabaud); large white petals, slightly shaded with yellow in the centre.

Madame Chebaune (Liabaud); globular shaped flower, canary yellow, outside of petals creamy white.

Madame de Moidrey (Vve. Schwartz); flowers borne singly, carmine red, centre bright carmine, reverse of petals tinted with bright carmine and salmony yellow.

Madame Désir-Vincent (Chauvry); globular-shaped flower, chrome yellow, salmon at the base, reverse of petals shaded with rose and violet.

Madame Grenville Gore Langton (Nabonnand); a large full flower, coppery-yellow, red at base, centre rose-lake.

Madame Louis Gravier (Garnow); well-shaped flower, clear salmon shade tinted with orange-yellow, edged with carmine-rose.

Mdlle. Anna Chartron (Vve. Schwartz); a large full flower, well shaped; cream colour, tinted and edged with bright carmine, centre light red.

Mdlle. Germaine Molinier (Vve. Schwartz); apricot-salmon, shaded with rose.

Mdlle. Marie Thérèse Molinier (Vve. Schwartz); peach shade of rose, yellow at base, shading off to light rose.

Marquis de Lagarde (Chauvry); a large full flower, violet-red in spring, dark rose in the autumn, reverse of petals blood-red.

Monseigneur Touchet (Corbœuf); full large flower, well shaped; a beautiful creamy-white.

Raoul Chauvry (Chauvry); light yellow, shaded copper colour, centre sometimes apricot.

Souvenir de Jeanne Cabaud (Guillot); a large well-shaped flower, outside petals coppery-yellow, those in centre apricot-yellow; a very fine variety.

Valentine Altermaun (Nabonnand); a well-made flower, pure white.

There are two or three things that strike one on looking through this list. So many flowers are described as globular, which I hardly think is the true shape for a tea rose; they are much more beautiful when the buds are long and pointed. Then, again, so many of them are high coloured, which to my mind is out of place amongst tea roses. Delicate shades of peach, apricot, yellow, and creamy white are those which I think are generally preferred. And, again, many of them come from apparently unknown raisers; there are, however, two flowers which we ought to look forward to with some degree of confidence, as they come to us from Guillot. I remember the time well enough when we used to speak of the present Pierre Guillot as "Young Guillot," his father being then living. Nabonnand has also given us some good roses, especially in the garden varieties, so that we may look for something pleasing amongst his new announcements.

HYBRID TEAS.

Ferdinand Batel (Pernet Ducher); a long flower of two colours, varying from very light flesh colour to nankeen yellow at the base, sometimes orange-yellow, very beautiful.

Ferdinand Jamin (Pernet Ducher); globular-shaped rose-carmine shaded with salmon.

Grossherzogin Victoria Melita (P. Lambert); long bud, large flower cream colour with yellow centre, somewhat similar to Kaiserin Augusta Victoria, but more vigorous.

Gruss au Teplitz, large cup-shaped flower, cinnamon-red, lit up with fiery red.

Gudrun (C. Jacobs); silvery-pink, centre clear fiery red.

Madame Cadeau Rainey (Pernet Ducher); a large well-shaped flower, rosy flesh-colour shaded with yellow at the base of the petals, which are edged with carmine-rose.

Madame Jules Grolez (P. Guillot); china-rose colour, very free flowering.

Mdlle. Marguerite Appert; a very large globular-shaped flower, brilliant bright red, darker at base of petals.

Preciosa (Vieweg); velvety-shaded carmine-red, shading off to crimson.

Souvenir de Madame Camusat (Bonnaire); fleshy-rose on outside of petals, inside bright carmine-red.

I think it is impossible from these descriptions to accurately gauge what the flowers will be, and so it is to be hoped that we may have an opportunity of seeing the blooms and judging of their merits soon. There are, of course, other roses announced of different classes, but I have contented myself with describing those which belong to the three [illegible] classes of exhibition roses; a great many of them we may [illegible] anything of, but we shall only be too thankful if some of our enterprising professionals will give us the opportunity of seeing them in the [illegible] season; our expectations are moderate, so perhaps we shall not be disappointed.

H. H. D.

Phlox amœna and P. divaricata.—The brilliant colour and easy [illegible] of Phlox amœna should lead to its being more largely grown. Some [illegible] now in flower here are very attractive, the plants being covered with their [illegible] pink flowers, borne on stems six inches in height. As it is neat in habit, it is an admirable subject for edging as well as the rockery, succeeding well in [illegible] any soil. Another dwarf species now in flower is P. divaricata, also known as P. canadensis. The flowers are borne on slender stems, about one foot in height, bearing corymbs of pale-blue flowers. A white variety of this is also in cultivation, making a fine contrast. For the front row of a border, these dwarf [illegible] are very effective when planted in a mass, thriving well in any good [illegible]—E. S., *Woking*.

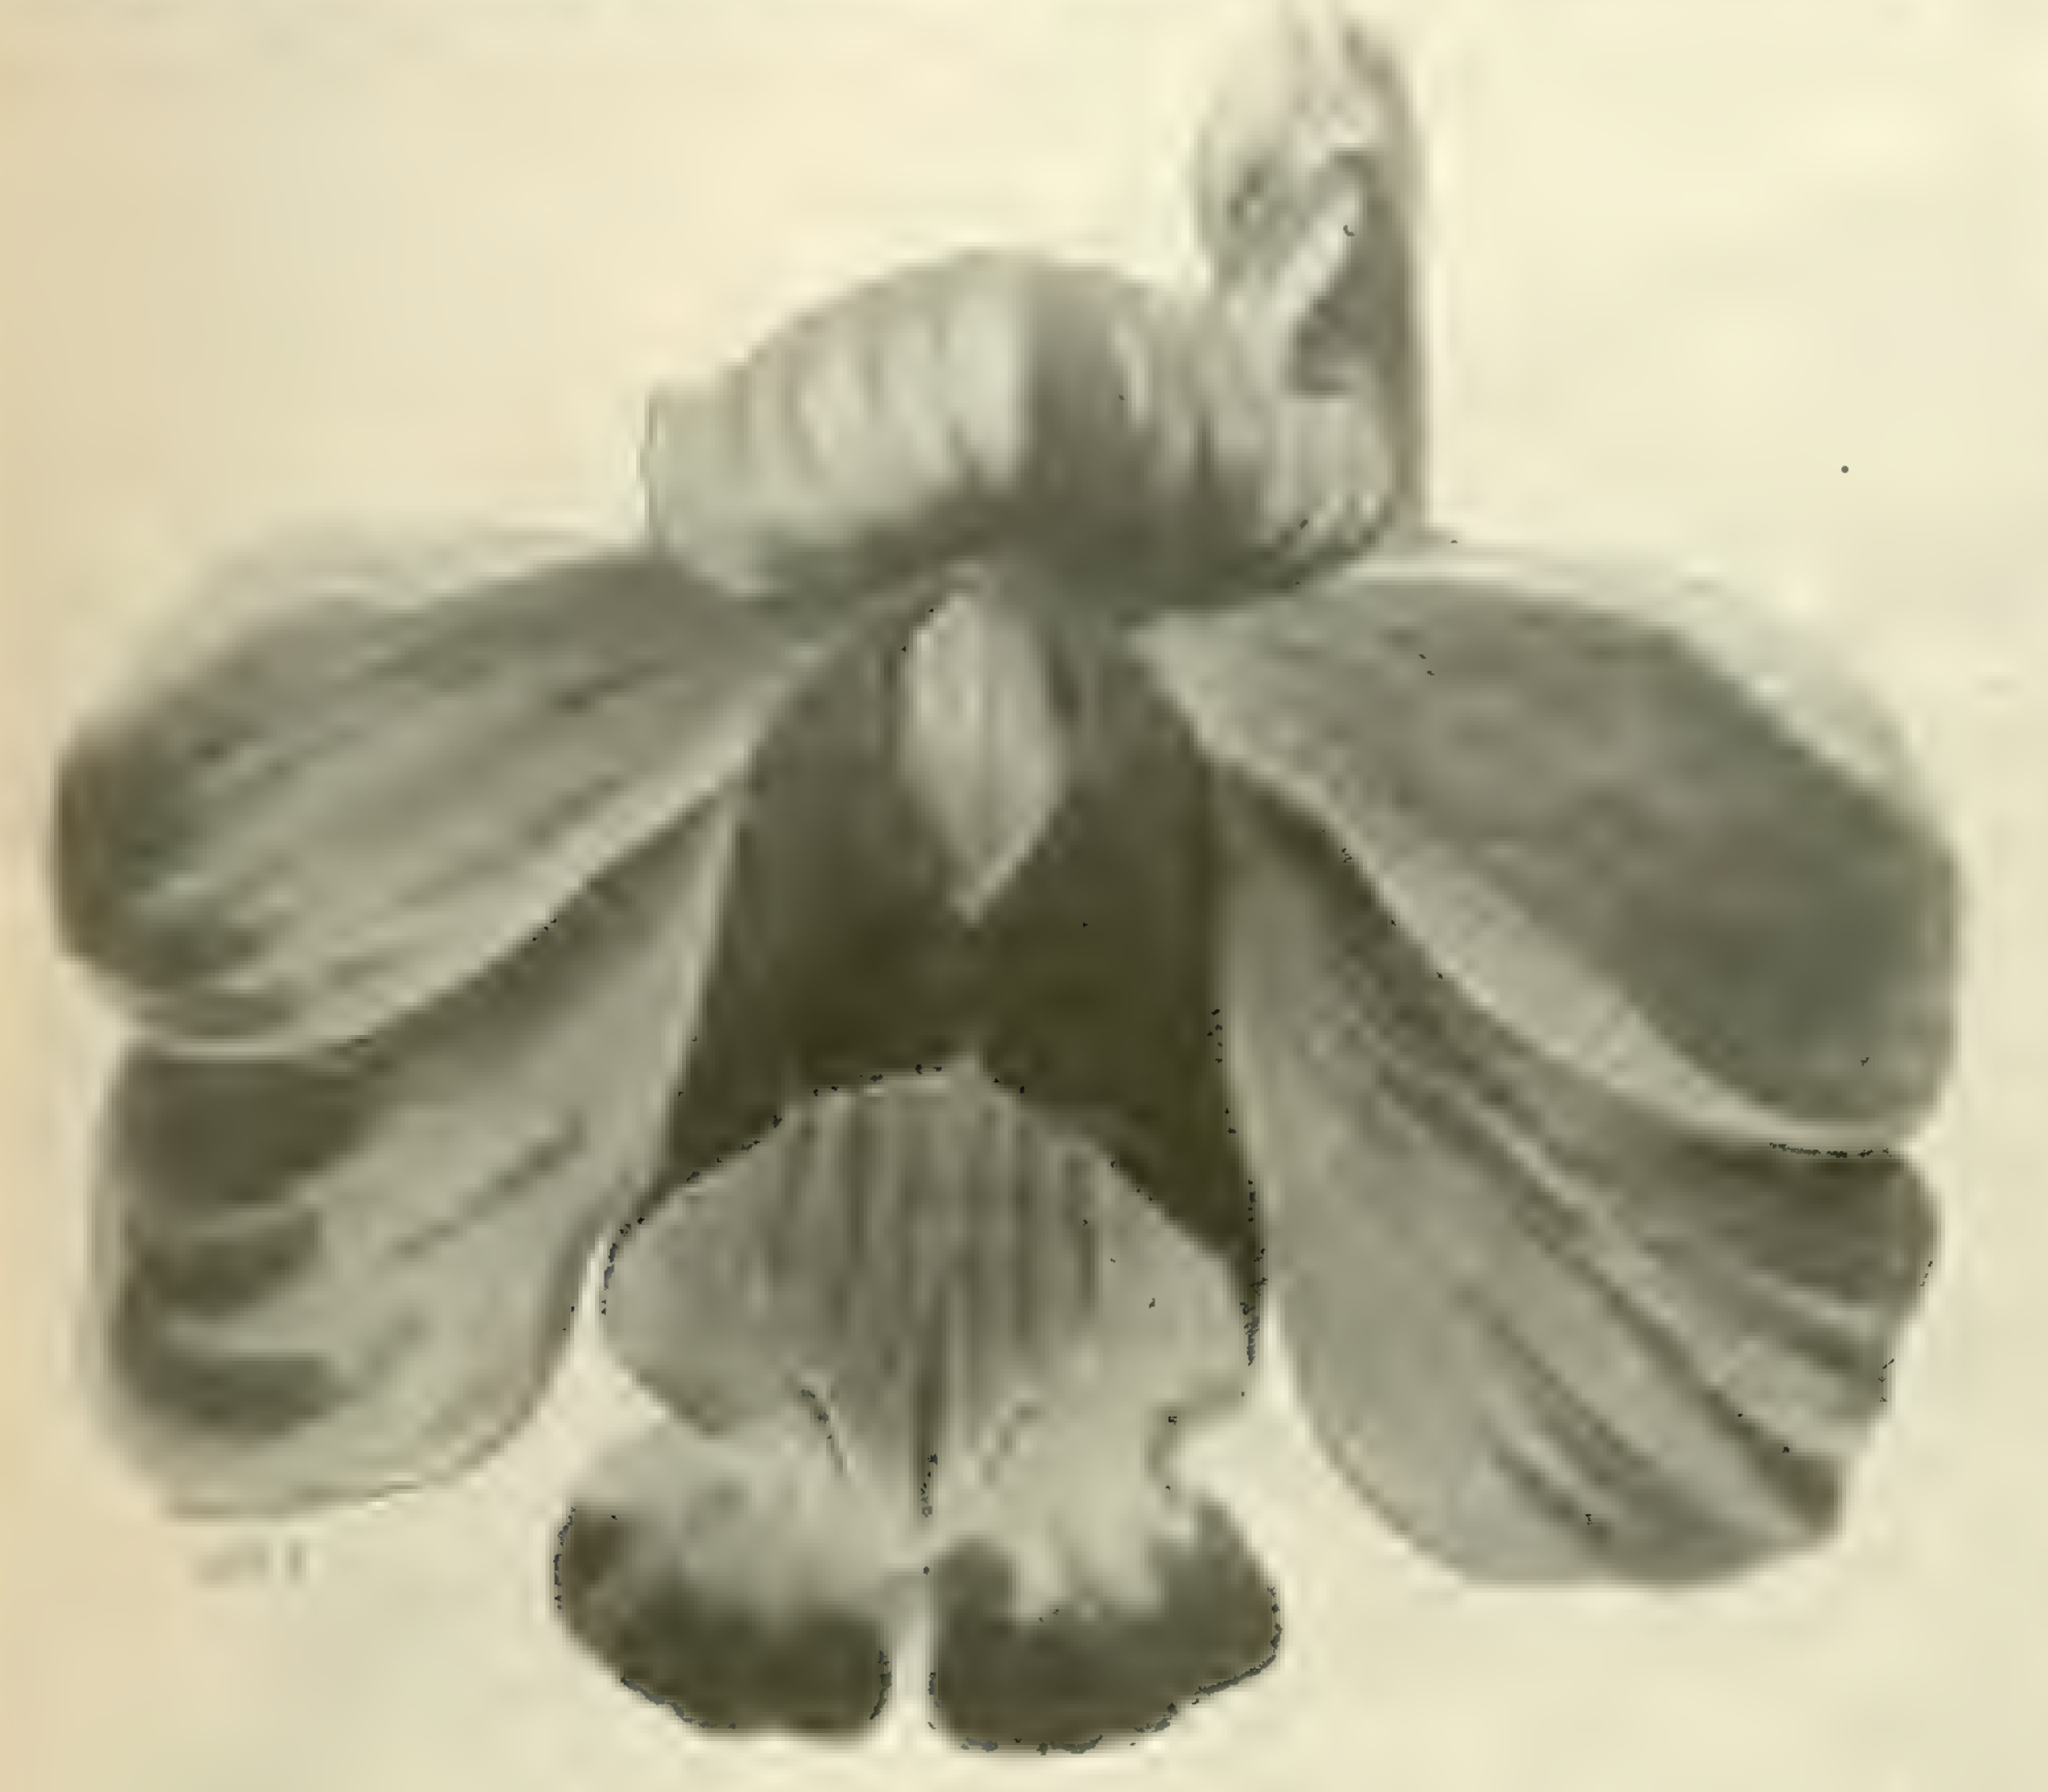
NOTES ON ORCHIDS.

EPIDENDRUM XANTHINUM.

One of the most interesting and handsome orchids that bloom in a cool house during the spring time is Epidendrum xanthinum, a species that grows in a bamboo-like tuft, and has slender stems varying up to three feet in height and clothed with thick, linear-oblong leaves. The long curved peduncle is a continuation of the stem and at its apex bears a sub-capitate raceme of golden flowers, closely packed together. Each flower is about three-quarters of an inch across with a distinct trilobate lip that is exquisitely fringed. This orchid is admirably figured in the *Bot. Mag.* t. 7586. The species was discovered in the Brazilian province of Minas Geraes by Von Martius; Burchell and Gardner both found it at later times and Gardner discovered it in 1837 on the Organ Mountains, near Rio de Janeiro. E. xanthinum is most effective when flowering and is fine for associating with other plants than orchids.

EULOPHIELLA PEETERSIANA.

Undoubtedly the finest of recently-introduced orchids is Eulophiella Peetersiana, a species introduced from Madagascar by Mons. A. A. Peeters, of St. Gilles, Brussels, after whom it has been named. It is a very strong-growing orchid, having a stout rhizome, with a tendency to climb and creep. The leaves vary from two to five feet in length, while the inflorescence rises to a height of five feet, bearing along its upper portion upwards of twenty large rose-purple flowers, as described in our issue of April 16 last. Each flower is three and three-quarter inches across, and, as will be seen by a glance at the present illustration, all the segments are broad and rounded. The soft purplish-rose tint seen in the sepals, petals, and front lobe of the lip is very pleasing. At the tip of each sepal there is a rosy-crimson flush, while the lip is white inside and beneath, except for the six long lines of dull yellow in the throat, these terminating in several wart-like prominences just behind the apical lobe. Like Eulophiella Elizabethæ, this is an orchid needing plenty of heat and moisture, but, being very robust, it is not so difficult to cultivate as the last-named species. It has been ably managed at Burford Lodge by Mr. W. H. White, orchid grower to Sir Trevor Lawrence, Bart., and, notwithstanding its huge spike of last April, the specimen is now growing vigorously again. It is to be hoped that our enterprising orchid importers will soon be able to supply specimens, for even if Mr. Hamelin does not wish to return to his much-talked-of Madagascar wife, there are no doubt others willing to collect orchids in the country where the Rev. W. Ellis made so many finds of horticultural value. A specimen of Eulophiella Peetersiana was sold by Messrs. Protheroe and Morris on the 27th ult. for £39; it was sent to the auction room by Mons. Peeters.—C.



EULOPHIELLA PEETERSIANA

ODONTOGLOSSUM REICHENHEIMI.

This bold orchid is no doubt a variety of the polymorphous O. læve which in its typical form is not a very handsome orchid. O. Reichenheimi is now fairly plentiful in collections and always attracts attention by reason of its robust and somewhat stiff spikes of yellowish-green and purple-brown flowers. The blooms are by no means unlike those of several miltonias as regards shape, and, indeed, the almost entire absense of calli on the lip makes this orchid a connecting link between miltonia and odontoglossum. The sepals and petals of O. Reichenheimi are yellowish green with heavy bars of dark purple brown; the narrow lip is purple and not deflexed as in the true O. læve. It is a most robust growing cool orchid, and when in good condition will produce a branching spike from two to three feet high and bearing a score or more of flowers. As a cool orchid this should not be overlooked by amateurs with small collections.—C.

SACCOLABIUM MINIATUM.

Among small growing East Indian orchids there is scarcely one that produces such brilliant flowers as the Javanese Saccolabium miniatum. Unfortunately it lacks boldness, but then we have plenty of bold orchids though few that bear such bright orange-red flowers as this little species. It flowers freely and a very small plant will bear a pair of cylindrical racemes of small but pretty flowers that are fattish and with a short spur. Specimens do well in the East Indian house either on a block or in a small teak basket with sphagnum moss about the roots; a liberal supply of water is needed and nothing approaching drought should ever be allowed. The species flowers regularly at Kew and it was represented in Sir Trevor Lawrence's collection of orchids at the recent Temple Show. S. miniatum was found in Java by Thomas Lobb in 1846 and introduced by Messrs. Veitch and Sons, Chelsea.—C.

CYMBIDIUM TIGRINUM.

Amongst the hosts of rare, interesting, and beautiful orchids that were brought together recently at the great Temple Show, few interested me more than a splendid example of Cymbidium tigrinum staged amongst the costly gems belonging to Sir Trevor Lawrence, Burford Lodge, Dorking. I was interested, not because it was a stranger—for we have several specimens in bloom here now—but I thought that, others seeing it, they would be induced to cultivate it, for there are few orchids so easily managed as this, while its flowers are both handsome and lasting. It is a very old orchid, being one of the many introduced by the late Rev. C. S. Parish. This gentleman found it in 1863, upon rocks on the mountains of Tennaserim, at an elevation of 6,000 feet. Its elevated home is, to some extent, an indication as to where it should be grown under cultivation. With us it is treated as a cool orchid, being suspended in the Masdevallia house, planted in pans three parts filled with drainage, in a compost of two parts peat, one of fibrous loam, and one of moss. Except when rooting freely, the water supply is very limited. To those who have not had the pleasure of seeing this little gem, a short description may be instructive as well as interesting. It has ovoid pseudo-bulbs nearly two inches in length, each bearing three or more oblong-lanceolate, recurved leaves that are six inches long. The scapes are slender, sub-erect, about a foot long, usually three-flowered, sometimes more, and as the blooms are well separated from each other, their individual beauty is clearly apparent. The sepals and petals are similar and sub-equal, linear-oblong, acute, two inches long, olive-green, paler at the margin, and spotted with red at the base; tip oblong, three lobed, the side lobes rotund, erect, yellow, striped obliquely with red-brown bands; the frontal lobe is sub-quadrate, apiculate, reflexed, white, with short brown-purple transverse streaks; between the side lobes are two raised white lines. The column is arched, pale olive green, and spotted with red below the stigma. Taken all together this is a charming orchid, and one that does not, under ordinary treatment, degenerate; our plants, as evidenced by the bulbs, grow stronger yearly.—W. H. YOUNG, *East Sheen.*

SCUTICARIA HADWENI.

The subject of this note is not one that the R. H. S. orchid committee would consider worthy of a "First class certificate," and yet to a lover of the curious members of the orchid family, this would rank before some having more gorgeous flowers, not that its flowers are unattractive, though somewhat sombre in hue. A plant here in Sir Frederick Wigan's collection, growing in an eight-inch basket suspended from the cattleya house roof, is carrying seven large and distinct flowers. A detailed description will be useful in showing the difference between the species, and the only other member of this genus, S. Steeli. S. Hadweni has a very short creeping rhizome, from which spring the dark green terete leaves, whose base is sheathed to the rhizome in ash-brown bracts. In contrast with the other species, whose leaves are pendulous, and two or more feet in length, these are erect, and from a foot to fifteen inches long. The peduncles are stout, four to five inches long, semi-erect, and one flowered, though on rare occasions it produces two on a scape. The flowers are about three inches in diameter, sepals and petals spreading, fleshy, oblong-acute, chestnut-brown, paler towards the apex, sometimes broken up into blotches on a yellow-green ground, lip broadly obovate, concave, downy within, pale yellow, blotched and spotted with light rose. It has a flat, oblong, three-toothed crest, and a semi-terete column, much spotted with purple, and white at the apex. It was introduced so long ago as 1851, from Rio de Janeiro, by Mr. Isaac Hadwen, in whose garden it flowered for the first time. Its cultivation is very easy, as its requirements are few and simple; all that it needs is being planted in a well-drained basket, in peat and moss used in the proportion of two to one, and never given a large quantity of water, especially during the winter months, when it will succeed for a long time without a direct supply. The shady side of the cattleya house will suit it at all times.—W. H. YOUNG, *East Sheen.*

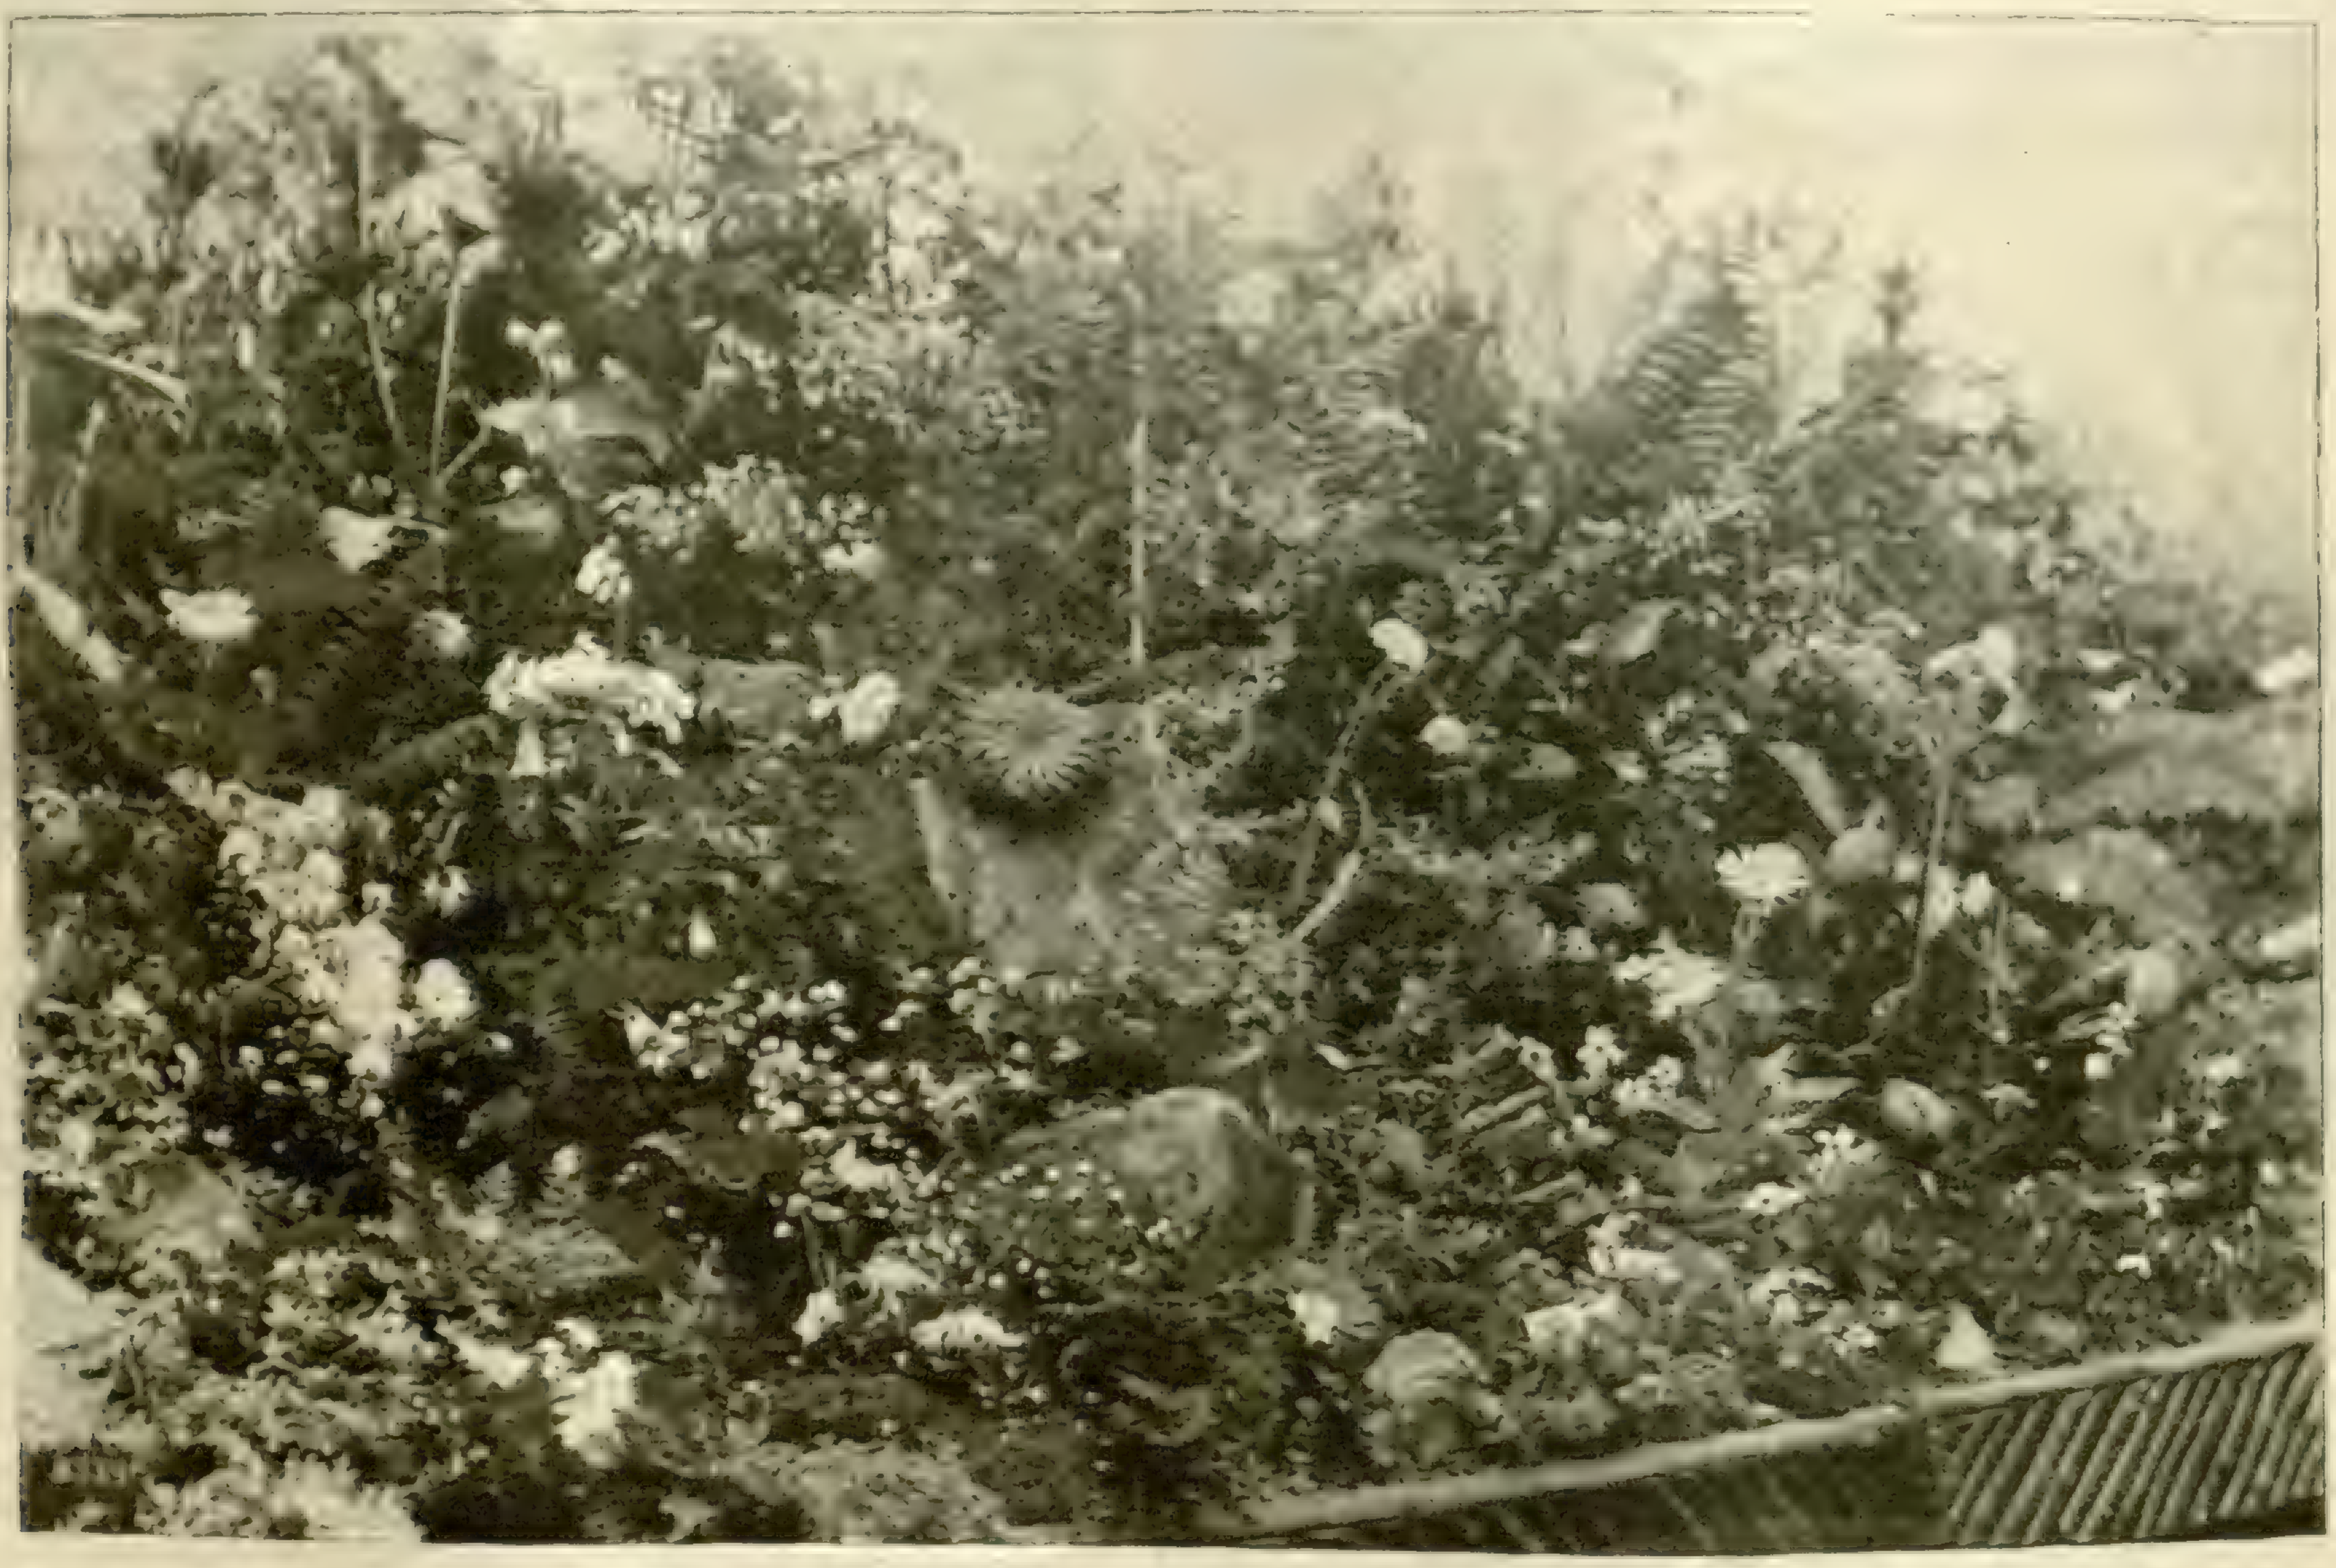
DENDROBIUM TETRAGONUM.

Orchids hailing from Australia are seldom of a very showy character, and the subject of this note is no exception to the rule; but it is of sufficient interest to warrant a few moments' consideration. Presumably, it is a native of the northern regions of the the Australian continent, as it requires a tolerably warm atmosphere to grow in. The plant from which the following description was taken is growing on a block of native wood as imported by Mr. Grimsdale, Kent Lodge, Uxbridge, in whose small, but ever-increasing collection, I had the pleasure of seeing it. It has slender pendulous stems, acutely four-angled, eight to fifteen inches long, attenuated to a slender stalk, which is pseudo-bulbous at the base. These are surmounted with two or three spreading, oblong-lanceolate leaves, three to four inches long. The flowers are produced at or near the apex, usually in pairs, three to four inches across individually, having the sepals yellow, spotted red, the dorsal one narrow, subulate; and the lateral ones lanceolate, much broader at the base than the dorsal one. The petals are white, streaked with red, linear, shorter and narrower than the sepals; tip white, transversely barred with red, broadly ovate, apiculate, obscurely three lobed, with two white lamellæ between the side lobes. As grown by Mr. Grimsdale, its requirements are few, he simply immerses it in a pail of water several times a week during the growing season; and during the resting season it simply hangs up in the stove, and the moisture arising from damping down seems to suffice for a long period.—W. H. YOUNG, *East Sheen.*

Herbaceous Calceolarias at Farnham Royal.—Writing this several days prior to the Temple Show, and having but just seen Mr. W. James's superb collection of herbaceous calceolarias, I can but think the Temple verdict will be that a finer and more brilliantly coloured lot of plants never has been staged there by this well-known grower. I say so much without in the least attempting to prejudice the fine collections that will doubtless come from other growers, for in these days there is a hard fight to have the best plants and strains. But ever since the show made by Mr. James at South Kensington, thirty-two years since, at the Great International Exhibition, with that collection which then became known as the International Strain, there never has been any receding on the part of the firm, but on the other hand there has been if a very steady, at least permanent, advance. The art of growing these somewhat difficult plants seems now to be better understood than it was even then, and the collection at Wood Hill is really a triumph of culture. The whole of the large group being prepared for exhibition were raised from seed sown at the end of June, and they are in sixteen inch pots. Whilst about twelve inches in height, the plants have glorious heads of bloom, some eighteen inches through; none are in the least drawn, all are stout, sturdy, and very clean. The smaller plants, of which there are several hundreds, were from a sowing in July. The whole, now in full bloom, presents indeed a brilliant sight, especially in the low clearly lighted houses. Of colours there is an almost pure white, the best of its kind ever yet seen, and the yellows of various shades are glorious, some of the dark hues partake almost of the fiery scarlet, but there is the usually brilliant galaxy of spotted and self colours in beautiful variety. Few plants need more care taken to insure their safety and entirety on the show-table, after a journey of nearly thirty miles, than do these calceolarias, yet the grand effect obtained from a fine collection amply repays for the labour taken.—A. D.

A MINIATURE ROCKERY.

It is not every grower of hardy plants that will give the time and trouble and incur the expense of constructing and conveying to an exhibition a miniature rockery, upon which his choicest dwarf plants are disposed. Several firms have done this, however, and the most successful have been Messrs. Backhouse and Son, of York. This firm had a most charming display at the recent Temple Show, for their miniature rockery was well put up and as naturally and tastefully planted as possible ; indeed, in no other way could small-growing hardy plants have been so pleasingly exhibited. The illustration of this exhibit, reproduced from a photograph specially taken for us, conveys a far better idea than words can of its effect and novelty. Plants that are readily distinguished are the various saxifragas dotted quite naturally upon or between the rocks, and looking perfectly at home, whether in flower or not. Darlingtonia californica, the curious Side-saddle plant, is very conspicuous, with the pretty Pyrenean primrose, Ramondia pyrenaica near by. Gentiana acaulis was a feature of the display, being represented by a considerable cluster of its blue flowers. Several of the hardy North American cypripediums were present in flower, and C. spectabile is prominent near the Darlingtonia. Here and there are little tufts of dwarf ferns, such as Asplenium fissum and tiny lastreas ; several campanulas were flowering freely, but the most conspicuous member of the order was the deep blue flowered Symphyandra Wanneri. The bold foliage of Podophyllum Emodi is seen on the left of the picture, with Geum miniatum nearer the centre. A fine background for this display was formed of hardy ferns of sorts, rhododendrons, &c.



A MINIATURE ROCKERY.

VEGETABLES FOR EXHIBITION.

SCORZONERA.

Perhaps few vegetables are less cultivated in this country than scorzonera (*Scorzonera hispanica*), and as a rule it is seldom asked for in the kitchen. I have known some cooks quite ignorant even of its name, and I well remember once being asked by a person holding a responsible position as such, "How do you cook that stuff?" and I replied that my business was to cultivate and not to cook. The result was that next day the scorzonera was found in the pig-pail, of course, uncooked. In all suitable sized gardens, however, a place should be allowed for a small bed of scorzonera. The roots when well grown much resemble salsify, and the crop should receive similar treatment. It must not be sown too early, or it will run to seed, even more readily than salsify. The first or second week in May is quite early enough for seed sowing, and the crop should be lifted as required. For exhibition, scorzonera is not very telling in a collection of vegetables, and should only be included as a last resource, except in a miscellaneous assortment. To have it in the best condition, holes should be bored as for salsify, and the roots prepared and staged in the same way.

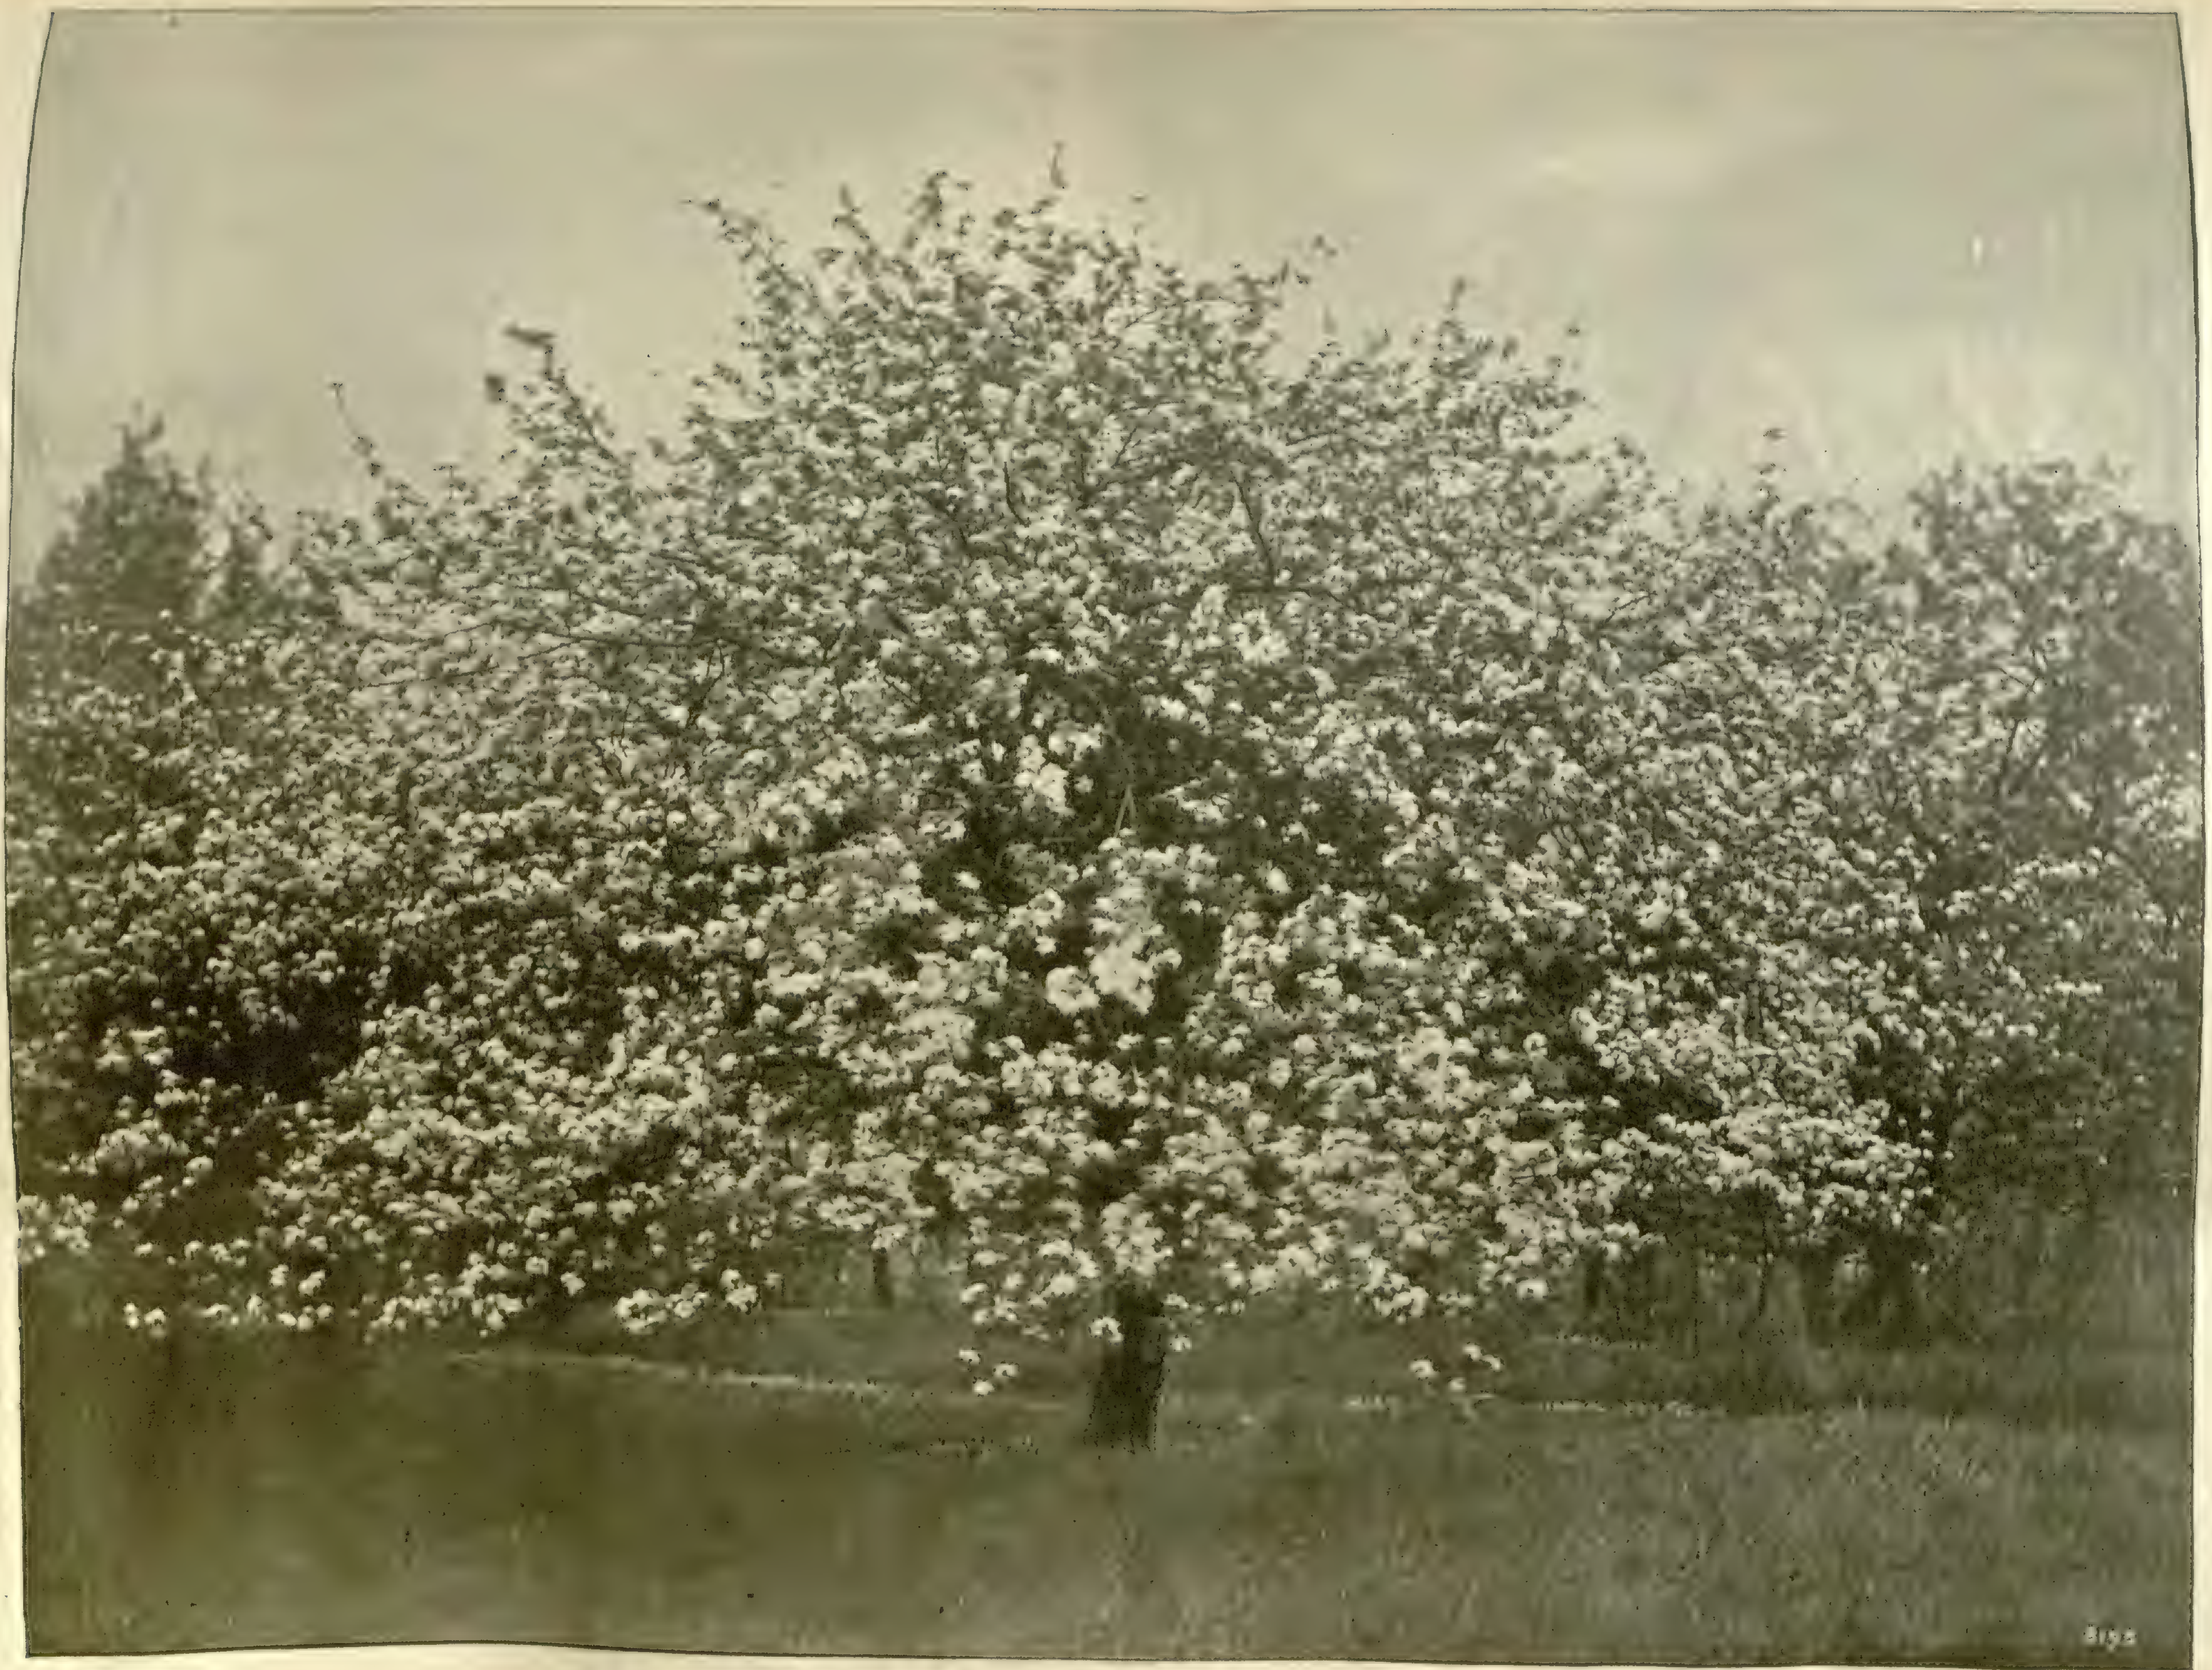
A RENOVATED APPLE TREE.

Time after time, and especially in connexion with the series of articles entitled "The Wasted Orchards of England," we have pointed out in these columns that many orchards throughout the country might be rendered productive and profitable if means were taken to renovate the trees. It was shown that in not a few cases all that was needed was a removal of old and dead wood and a thinning out of the branches, with the application of some new soil or fertilising agent to help the trees into renewed life and vigour. We have frequently received letters from various parts of the kingdom, proving that our views are correct, and that the writers have benefited from following the advice given in these pages. One instance, among the many, of the great advantages that accrue when orchard trees are renovated, we give in the present issue. We do not assert that all orchard trees could be so renovated, far from it, a large number are but cumbering the ground, but there are many that with similar treatment and care, or with treatment suitable to the demand of circumstances, could be brought into as healthy and fruitful a condition as the fine Blenheim Pippin apple tree figured in our present issue.

The specimen represented belongs to Mr. J. Woodin, Anerley Road, Anerley, S.E., to whom we are indebted for the photograph from which our reproduction was made. Mr. Woodin writes that the Blenheim Pippin apple tree is one of several of the same variety planted about forty-five years ago. About thirty years ago these trees, with others, came into his possession, and at that time were large healthy specimens that bore good crops annually. After about twenty years they began to show signs of decay, or, at least, a considerable loss of vitality, for the ends of the leading branches withered away, indicating that something was wrong at the roots. The soil is a stiff clay, and so, to remedy matters, Mr. Woodin had a circular trench taken out two feet wide and three feet deep, at a distance of four feet from the trunk of each tree. The clay excavated was burned into ballast, and then used, with some good sound loam, a quantity of crushed bones, and a considerable quantity of wood ashes, all mixed together, for filling up the trenches. This compost, being naturally porous, was made firm in the trench, and very soon the trees rooted into it. The result of the treatment was to immediately put a stop to further decay, and for the last twelve years the trees have blossomed splendidly every year, and, except on rare occasions, when late frosts or heavy rains prevented complete pollination, there have been large crops of good fruit.

The specimen shown is a fine type of an orchard tree, beautiful to look upon when in blossom, and bearing food of a high quality in the autumn. The little trouble and expense taken to renew the life and vigour of such a tree has been abundantly repaid, for the specimen now has a head thirty-eight feet in diameter. Further comment is unnecessary.



A RENOVATED TREE OF BLENHEIM PIPPIN APPLE AT ANERLEY

DWARFED CHRYSANTHEMUMS.

As Mr. Fry has stated (page 326, May 21), the practice of striking cuttings of chrysanthemums in May or June for dwarf plants has evidently been known and adopted for very many years, and even in the country of Italy, where the chrysanthemum can hardly yet be considered up to date, this system has been the usual practice of cultivation in pots, propagation starting from the month of May.

However, my object in trespassing on your space is in reference to an account which I read in the MAGAZINE some months ago, I think, of exhibition cut blooms obtained by propagating in May and June, and the consequent saving of several months, and the most uncongenial ones, of labour. I do not know whether this article was in the mind of your correspondent, Mr. George Fry, but in my opinion the two questions should not be confounded.

If it be conclusively proved that, by starting with cuttings in May, exhibitions blooms can be obtained to equal those the result of winter propagation, a great change will come o'er the scene, but I suppose we shall patiently go on as hitherto, and wait without anticipating such an event. Nevertheless, should some varieties come really good in this way, much credit is due to the originator, Mr. Lyne.

Anything new as to experiments or methods of cultivating the chrysanthemum is nowadays remote, and I will refer in this letter to the article (page 332, May 21) on "An Experiment to Induce Sporting." Some ten years ago, after an exchange of opinions, or rather my receiving advice from a famous horticulturist (I refer to Mr. J. Laing, of Forest Hill), I grafted, or more correctly inarched, several varieties. If any change appeared, I imagined the second year of the plants so treated would be more likely to show it than the first, and for this reason I retained the plants for two or three years, but there was nothing to relate, excepting that the two best blooms of E. Molyneux that I have flowered were from grafts on Guernsey Nugget. I well remember a plant of Bronze Queen which I had grafted on an Empress in several places, and wondering whether the sport might revert in any way.

There is nothing new to record about the chrysanthemum in Italy, except, as my friend Mr. Payne has kindly mentioned, that we have started a National Society, and the starting change has been made to call the chrysanthemum the "King of the Autumn;" but I will leave this matter severely in the hands of the hon. foreign secretary of the N.C.S., who, I hope, will take up the matter, as I have done my best, but without avail.

I enclose a couple of circulars announcing existence of the society.

HENRY BRISCOE-IRONSIDE.

Palanza, Lago Maggiore, Italy.

NOTES FROM IRELAND.

OWING to the continual wet weather, with piercing cold winds, the season bids fair to be an exceedingly backward one. Plums appear to have set a very scanty crop in these gardens; some pear trees are carrying a good crop so far, but other trees have none at all. Cherries and gooseberries are a fair crop; currants are excellent; apple trees are a wealth of blossom. Strawberries, too, promise to render a good account of themselves later on. Early potatos came up well, but during the past week there have been from five to eight degrees of frost, and I have seen several instances where they were cut down to the ground. Late varieties fortunately were not sufficiently advanced to be injured. Several clumps of Gunnera manicata are badly damaged from the same cause. I do not remember to have seen a finer display of tulips than there is, or has been this season. Narcissi have been very good, but in some districts the grub is doing great havoc. Can anyone suggest a certain remedy for the complete destruction of this pest? The rockery is now very gay with numerous phloxes, iberis, saxifrages, alyssums, &c. Saxifraga granulata fl. pl. is exceptionally fine this season; so is Alyssum saxtile in masses. Aubrietias in variety are particularly effective now. In the herbaceous border proper it is too early to find much in flower, but Dielytra spectabilis is particularly showy now, the doronicums are on the wane, as they have furnished a brave display for a long time past. In the wild garden the bluebells are very effective in their varied shades of blue, pink, and white, while the fields are golden with cowslips. The furze hereabouts is a glorious sight, acres and miles of it to be seen a mass of yellow. Blackthorns have been beautiful, but are now upon the wane; they will, however, be succeeded by the hawthorn, which promises a rich harvest of bloom. The Ghent and Mollis azaleas are exceptionally floriferous this year. Azalea amœna, too, is flowering well outside this year. Roses on walls are rapidly expanding. I am greatly pleased with a new hybrid tea rose, of Irish origin, which has been grown in pots here this year for the first time; the colour is coral pink, somewhat after the style of La France in the bud state, it is a glorious rose, but is somewhat loose when fully expanded. The name of this acquisition is Mr. J. W. Grant, it is a very strong growing variety, in fact, if planted out it should make a good pillar rose, or it should be well adapted for covering fairly high walls. Hedges or crab trees are exceedingly pretty just now.

[illegible] Gardens.

R. WELLER.

Frogmore Prolific Tomato.—It is always safe to speak well of the bridge that carries you safely over, and so I write highly of Frogmore Prolific tomato. From seed sown in July, and the plants chiefly grown in 16-sized pots, our crop has carried a very nice lot of fruit, for since the first week in January we have always been cutting ripe fruit. The size of this variety is not large, but the fruits are handsome and most freely produced. A good few are planted out, but pots do equaly as well for this variety. In the middle of winter I find that what fruit then sets partakes very much of the Old Red style, but with lengthening days and better weather a different tale is told. I have not much faith in the actual profits of any winter-grown tomatos, yet, if a vinery is in work with young vines, something must be grown to help pay for labour, and here this variety of tomato is very useful.—STEPHEN CASTLE, F.R.H.S., *Bottesford Vicarage, Notts.*

NOTES OF OBSERVATION.

Pansies.—Judging from the wonderfully fine blotched pansies seen so plentifully in shops and markets, there should be worked at no remote date a revolution in garden pansies, assuming that these plants be purchased largely, as doubtless they are, and are planted in gardens. Really the quality found in these fine blotched forms is of the richest. Few named varieties can possibly excel them. They are the produce of a seed strain of remarkable quality, and it is but needful to have seed produced in great abundance, so that it may be sold fairly cheap, to have just such noble flowers in every garden. Whilst it is assumed that the bulk of the plants come from one source, it seems hardly possible that they can long be a select issue. Anyone can purchase a few dozens, and plant them, and if well cared for there is no reason why the strain should not become common. Beside these ordinary strains look indifferent, though many are wonderfully free, and have large flowers. No doubt they are brought into bloom so early by growing them in frames, but the quantity put upon the market weekly must be immense. The method of production, the soil being highly manured, shows, however, how pansies appreciate high treatment, indeed, how amply such culture is repaid. If we want mere masses of colour only, such as bedding varieties or violas give, then high-class culture is not required; but when we grow blotched pansies of any section we like to have them very fine, of good substance, flowers bold and well expanded, and of rich colours. These features we get in the strain referred to. The old show or English pansy has had to give place to this bold, rich, striking section, just as incurved chrysanthemums have gone down before the fine, varied, and beautiful Japanese. Such changes in popular favour are inevitable in floriculture.—D.

Dropmore.—If to be able to enjoy a visit to a garden or place, however repeatedly made, is evidence of its attractiveness, then is for that reason Dropmore singularly so. But if at any time delightful, even in mid-winter, never is it more so than in the month of May, when the beeches, limes, and birches have just put on their new coats of the loveliest possible shades of green—the sycamore are of the densest in foliage, the conifera dark foils to the new, tender leafeage, and the oaks give a rich golden hue that is wondrously effective in its contrast with the heavier greens. Everywhere there is such a wealth of fine trees of every description that it is not possible to walk a few yards without coming upon some striking specimen or group that at once commands attention. But just now, at the end of May, the vast masses of rhododendrons are becoming brilliant with colour, and the azaleas, singly and in colonies, in every direction fill the air with perfume and the scene with beauty. There are grass and gravel walks and tracks, mile upon mile, that are to the stranger bewildering, yet all is fraught with loveliness. Surely there are few places anywhere just like Dropmore. No wonder so many lovers of the beautiful like to visit it. Never has it been better kept than now; it is under Mr. Herrin's fostering care. In all its features it seems to be so far removed from the modern garden, where all is so new and so mixed. Nothing at Dropmore seems incongruous. Even the glass-houses partake of the general character of the place, and have the merit, that is, if it be such, of presenting adverse conditions for culture, because they are not of modern construction. The quaint flower-garden is as it was in old Frost's time, and its denizens have been materially added to without in any way rendering it farish or formal. Anyone who wished, in easy reach of London, to find complete abstraction from the outer world with all its care and excitements, could not do better than visit the sweet solitudes of the Dropmore groves and glades. What a heaven-like place of sepulture would it make for the wearied dead.—A. D.

The Brassicæ Family.—When the mind is in a reflective mood it is strange to note into what odd channels it will run. It was so with me the other day, when passing a table in the town laden with superb examples of white broccoli heads, and noting their solidity and perfection of form, for they were wonderfully good. My thoughts were insensibly diverted to that assumed parent of all the cabbage tribe, said still to be found on the chalk cliffs of our eastern coasts, Brassicæ oleracea, a very crude leafy vegetable, and marvelled that from out of it should have come, of course, over a period of hundreds of years, such a remarkably diverse family as we see now, is brassicæ, of which these fine broccoli were not the least valuable or interesting. Is there any other parent species in vegetable life that can show such varied progeny, and one so valuable for human food as does this original cabbage, specially cauliflowers and broccoli, the one tender, the other hardy, yet otherwise alike, heads white as snow, solid and handsome, constituting most delicious food? There was a time when the Purple Cape was commonly known and much esteemed. That colour, or one of greenish hue, probably constituted the colour of the first break into broccoli form from the wild cabbage. We see something of that crude originality in the purple sprouting broccoli, so hardy and so useful in its late season. But so far as the production of white heads in cauliflowers and broccoli is concerned, we have got a long way from the old Purple Cape now, and are not likely ever to revert to it. During the past fifty years we have seen great advances made in the production of better forms of white heads, but it may have been three hundred years since that either or both originated in a distinctive form. How remarkably do the two members of the family differ from all the others in development. If we can conceive the human spine creating a head-growth of marrow-like substance, called brain, from out of the spinal cord, just so, from out of the marrow or pith of its spine or stem, does the cauliflower or broccoli plant evolve its head of similar substance, which continues to force up layer on layer of edible matter resembling brain, yet devoid of sensibility, and that matter becomes in the plants to us the highest form of food the Brassicæ can produce. How wonderful is it all when we come to reflect over it, but how apparently, how mysterious! There it is, as we know to our profit, but how originated, and why, remains one of Nature's mysteries. If we turn to the cabbage proper, whether white, red, or savoy, there the plant-forces are directed to the production of leafy masses, which we call heads or hearts, and are all the more valued when compact, solid, and internally white or red, and tender. Probably many persons would give to the white cabbage the highest place in the family circle, because it is everybody's vegetable, and we can have it all the year round. We may say almost as much of the white-headed members also, for they cover nearly all the year. Then there are the kales, which do not give hard, solid leaf-heads, but large clusters of loose leafage, sometimes curled, sometimes plain, some more or less sprouting, but all differing materially from the cabbage. Possibly some of these present the nearest approaches to original breaks from the wild cabbage. Not least, there are the singular Brussels sprouts, which furnish, on the top of a tall, stout stem, a head of trifling dimensions or value, but from the sides of its stem a long, continual series of small, hard, sweet green heads, that are, as food, of inestimable value. In these Nature seems to have diverted food-production from head and pith to the bark or alburnum, again exemplifying the versatility of Nature in the hands of the cultivator.—K.

WORK FOR THE WEEK.

COOL ORCHIDS.

Owing to the immense quantity of orchids now annually imported, and sold by auction at such reasonable prices, very many amateurs, with only the convenience of an ordinary greenhouse, have taken up their cultivation. Odontoglossum crispum is annually imported by hundreds of thousands, and as a serviceable and showy orchid it cannot be beaten; so there is small wonder it is such a general favourite. While this beautiful orchid may be grown without incurring any very great expense, there are also many other cool orchids that the amateur may grow in company with it, such as O. Halli, O. luteo-purpurum, O. Pescatori, O. gloriosum, O. triumphans, O. Cervantisi, O. Rossi, Sophronitis grandiflora, Epidendrum vitellinum, Cypripedium villosum, C. insigne, with many oncidiums and masdevallias, &c. In many instances I have noticed that the amateur who has not a house to devote exclusively to orchids, naturally desires to make the best possible use of it by growing a variety of plants in it. In such cases the house is usually well adapted for the wintering of these cool orchids, but during the summer months it becomes impossible to keep the atmosphere in the right condition for their well-being; there is a way out of this difficulty, and that is to move all the orchids into cool frames or pits for the next three months. If a cool, shady, brick pit is at command, a temporary stage will be fitted up, using sheets of corrugated iron, as they are easily fixed and the grooves carry off superfluous water; the sheets should be covered with a layer of small coke. Where brick pits are not at command, ordinary garden frames may be used, placing them in a cool and shady position, on a hard base of coal ashes; before the plants are removed to their summer quarters, the pits or frames should be thoroughly cleansed by scrubbing the glass and woodwork with soft soap and hot water, and it will be also beneficial to lime-wash the walls of the pits with hot lime, so as to kill any insects that may be hiding. Care should be taken not to crowd the plants together, so that the air may pass freely among them, and also render it easier to damp down, which should be thoroughly done two or three times daily in bright weather. Spraying over-head may also be practised on fine days, and a little air should be left on at night whenever the weather permits, increasing it in the morning; in rainy weather the lights should be tilted, so that the rain cannot reach the plants, and as soon as the sunshine reaches the glass the plants should be heavily shaded, less ventilation being then needed; after sundown the shading should be removed, and more air admitted. Lettuce leaves may be placed about in the frame, as slugs will be almost sure to put in an appearance, and these play havoc with the new roots. Should the nights continue to keep cold after the removal of the plants the lights may be covered with mats, or the change may prove a little too great. Plants grown in this manner become hardy and robust, and seldom fail to flower freely providing they receive careful attention; remove them to their winter quarters about the middle of September, though, of course, this depends upon the weather, for in the south of England they may be left out a little longer if carefully covered by night in case of frost.

Pleiones are now growing freely, and if the plants are strong and vigorous they should receive abundant supplies of water and occasional doses of weak liquid cow manure. Specimens that were not repotted should have a little liquid manure at every alternate watering, and this should be followed up until the foliage shows signs of maturity, when the manure must be discontinued. Zygopetalums will also require plenty of water at the roots, and a soaking of weak liquid manure once a week during the summer months will be greatly appreciated by them.—E. Shill, *New Hall Hey Gardens.*

STOVE PLANTS.

From the middle of June to the end of July is a suitable time for propagating crotons in variety, these to be retained in thumb and three-inch pots for dinner table decoration; some prefer the narrow-leaved varieties only for this purpose. They are certainly light and graceful, and have a pretty appearance upon the table; but where there is a great deal of this work to be done, one must have a variety of material, so that, say, during the course of a fortnight, should there be a table to decorate every night it will be possible to have a change on each occasion, therefore it is advisable to propagate some of the bold, bright-coloured, large-leaved varieties, such as Morti, Queen Victoria, Nevilliæ, Hawkeri, Youngi, Veitchi, Flamingo, &c.; amongst the narrow-leaved section may be mentioned Augustifolium, Aigburth Gem, Chelsoni, Mrs. Dorman, and Golden Ring. Other plants suitable for table decoration are Reineckia carnea variegata, coleus in variety, dracænas, Cocos Weddeliana, acalyphas, panax, aralias, cyperus, asparagus, [illegible], and others. Gloxinias as they pass out of flower should be gradually dried off, and stood in a cold frame in a sunny position to ripen their tubers, gradually giving less water as the leaves decay, until eventually it is withheld altogether. Caladiums, and stove plants generally, which are to be used for decorating in the rooms, ought to be stood in a cooler and drier house for a day or so before removing to the rooms, otherwise the sudden change may be too much for them. When cleaning the rooms in the early morning, the servants generally throw windows and doors wide open; such an experience is enough to try any plant, and how much more so one that has been brought direct from a warm, moist atmosphere. The earlier batches of poinsettia and euphorbia are now ready for shifting on, the stronger into six-inch pots, the weaker into four and five-inch pots, using a compost of good fibrous loam, leafsoil, dried cow manure, small charcoal, and sand: pot firmly, but not too hard. If there is a heated pit which can be placed at their disposal, so much the better; keep them close to the glass, gradually lowering the pots as the shoots extend. Give shade freely until the [illegible] are established, after which it can be gradually reduced until it is only used during the middle of the day; syringe twice a day, closing the frame at the time of the second syringing early in the afternoon

Winter-flowering begonias are ready for potting, and these also may with advantage be afforded a pit to themselves, as they may be grown cooler than the poinsettias, and though they may be syringed on bright days this must not be done in dull weather, or the leaves will damp. Thysacanthus rutilans and Reinwardtia tetragyna will be perfectly happy under similar conditions to the poinsettia for the present. Seedlings of Rivina humilis will set their berries best if grown in the intermediate house; this is a very beautiful plant when well berried, and is generally of great interest to the ladies. Pot on seedling gloxinias as they fill their pots with roots; five-inch pots are a suitable size to flower them in. Asclepias curassavica will now have filled the three-inch pots with roots, and may be shifted into six-inch, in which they will flower; grow them in the intermediate house. All the occupants of the stove are now growing freely, and should be afforded stimulants regularly—not too strong, but rather weak—and often. Repot any requiring it before growth becomes checked through restriction at the roots. Keep insect pests down by a free use of the syringe, or insecticides if this is not sufficient. Attend regularly to the thinning and training of climbers, if they are allowed to become too thick upon the roof the plants under them will suffer from the want of sufficient light. Less help will be required now from the heating apparatus to keep up the requisite temperature, but even in the warmest weather do not let the fire out; a little warmth in the pipes keeps the air in the house moving and healthier for the plants generally. When ventilating avoid draughts, especially in windy weather. By commencing to ventilate early and gradually increasing (anticipating the rise of temperature as it were) it will be possible to keep the temperature correct with a less amount of airing than would be the case were the temperature allowed to rise too high before commencing to ventilate. Anthuriums, alocasias, and marantas, while delighting in a moist atmosphere and copious syringings, must be carefully protected from the sun's rays while the foliage is moist, else they will be disfigured by scorching.—J. Tunnington, *Ripley Castle Gardens.*

KITCHEN GARDEN.

The cold weather of May caused much anxiety to those living in low-lying districts, as the cold nights retarded growth considerably. Never do I remember crops making such slow progress; the only plants that seem to thrive satisfactorily are spinach and cabbage, and these without doubt have done well. Colewort is often much prized in the autumn and early winter, and to obtain strong plants a sowing should be made about the middle of the month, and as soon as the seedlings are large enough to handle they should be pricked out on a piece of rich ground to give them a good start, in which place they may be allowed to stand till some crop is cleared off so that they may be planted out. Asparagus beds that are intended for forcing next season should not be cut over after the 20th inst. Growth should then be encouraged by giving the beds a good soaking with liquid manure, or, if this is not available, some artificial fertilizer, to be well washed into the ground. Mushroom ridges may now be made in the open for a late supply; care, however, must be taken to protect the beds from heavy rains until such time as the spawn has run. There is often much difficulty experienced in producing good mushrooms in very hot weather; for instead of being thick, fleshy, and large buttons, they are poor and of but little flavour. To have first class produce the beds should be made out of the reach of the mid-day sun and where the air is cool. Material should be prepared for successional beds, and when sufficient has been brought together this should be put up in ridges, and when of a suitable temperature the spawn ought to be inserted without delay. All kinds of winter greens may now be planted out, for the sooner the early supply is got in the better. If space cannot be afforded them at present have them pricked out six inches apart, as the plants ought not to remain in the seed beds crowding each other. Runner and dwarf beans have made but poor progress this season owing to the cold weather, the successional sowings being almost as forward as those sown in the early part of May. It is, however, well to be prepared, as it is possible we may have a fine autumn, when growth will continue till quite late in the season. When such is the case late sowings of these always prove useful. A piece of ground should, therefore, be reserved for a row of runners to be put in about the end of the month or early in July. Choose a sheltered situation, if possible, that the growth may not be injured by the rough winds in the autumn. Dwarf varieties of the Canadian Wonder type should now be sown in open situations, as these will make rapid progress in hot weather. Thin out the plants to a foot apart when the second rough leaf has been made so that they may grow sturdy from the commencement.

Celery trenches should be made ready, that the plants may be put out when they are large enough, for it is bad practice to allow them to become crowded and drawn, as is too often the case, owing to the pressure of other work at this time of the year. The manure used for the trenches should be thoroughly decayed, and this ought to be made firm, otherwise the roots cannot take hold of it. When left too loose the manure acts as a drainage and robs the soil of moisture. In planting see that the soil is pressed firmly round the roots, particularly that of a light sandy nature. Celery is a moisture-loving plant; therefore it requires plenty of nourishment if good stems are to be grown. Some prefer planting two or three rows in a trench, and where ground is limited this is doubtless a most economical plan, but much care is required both in watering and earthing, otherwise many of the plants will be spoiled. We prefer to grow the plants in single rows, as by so doing less labour is required in earthing. Make successional sowings of lettuce and other small salads, so as to keep up a constant supply. As the plants become large enough to handle see that they are planted out and kept well supplied with water; otherwise they will not grow satisfactorily. A pinch of endive seed may now be sown, but as this is not generally required while good lettuce may be had a small quantity will be sufficient. Attend to the thinning of all crops as they become large enough so that there may be no overcrowding.—H. C. Prinsep, *Buxted Park Gardens.*

FRUITS UNDER GLASS.

Melons in frames, when growing freely, will need careful careful attention in the matter of watering; the soil on the hillocks must not be allowed at any time to become dust dry, as it is impossible to get water to soak in if this once occurs. At the same time a sodden state of the soil is equally undesirable, and wet should be kept from the collars by fixing some protector such as a length of hoop iron round the stems at an inch or two away. Choose the early afternoon for watering, and, if possible, water when the succeeding night promises to be warm. Keep up the bottom heat by remaking the linings piecemeal, so that only a portion is disturbed at one time, and leaving the rest until heat is again rising from the newly made up portion. Close the frames early, shutting up all possible sun heat and syringing the plants freely before and after they flower until the fruits begin to ripen. This will keep them clean and free from red spider. Should green fly appear, vaporise at once with either of the two mixtures now on the market. Keep down woodlice by trapping, and introduce to each frame which contains these vermin a colony of toads which will be found very useful. In the matter of ventilation never forget that the melon is a tropical plant that will stand a great amount of sun heat without injury but which will not submit patiently to sharp cutting draughts. Should canker assert itself, I find nothing so good as fresh slaked lime freely applied to the stems, this will immediately arrest decay, but the application should be renewed from time to time as the lime perishes quickly from contact with a damp atmosphere. Keep all plants that have set their crop, closely stopped, as only the main leaves are necessary for the good of the plants and nothing is worse for melons than crowding the frames with surplus growth. Plant one or more successional frames and when the plants commence growing again pinch out the points to induce a fresh break for one or more leading shoots; by stopping the plants when small we are far more likely to have a set of fruit from the first laterals made from the new leads, than we are from those made by unstopped plants, and this is a great advantage as the frames do not then become so full of foliage.

Ripening pines will need to have the water supply and atmospheric moisture reduced to obtain really high-flavoured fruits, and if they can be removed to a house by themselves, in which they can be kept with dry surroundings instead of being mixed with plants in other stages of development, so much the better. When once they begin to colour it is easy to arrest ripening, if they are not wanted at once, by placing them in a cool house or shed, but in this case the water supply should be entirely cut off. Continue potting-up young stock as the pots become full of roots, as it is only so much lost time and vigour to wait till a big batch is ready before potting, and nothing is gained by allowing plants to become pot-bound until they occupy their fruiting pots. A portion of the larger plants intended for fruiting early in the autumn may be kept dry for a week or two, as this is generally safe practice to induce them to throw up fruits quickly. Bananas will now benefit greatly by being treated to a top-dressing of bonemeal and good loam, first removing or stirring up the surface soil, which will probably have turned somewhat sour, and then applying from two inches to three inches of the mixture, and over all an inch or two of half-decayed horse droppings. Bones when properly treated, are a perfectly safe manure, and their use can hardly be overdone. The summer weather we may now expect will cause the bananas to grow freely, and sun heat should be husbanded for them, for, unlike many other fruits, the stronger and quicker they grow the better will be the results. Plenty of atmospheric moisture should be kept up in the house. Pot plums and other orchard-house fruits should have the points nipped out of the new growth, as this will develop spurs and prevent the trees from growing wild and straggly. There is no doubt that the finger and thumb form the best pruning instrument for all stone fruits, and especially for those which are liable to gumming, and this fact should not be forgotten while summer growth is going on.—J. C. TALLACK, *Livermere Park Gardens.*

GARDENING CHARITIES AND GARDENERS' WAGES.

RECENTLY there has been a revival of a discussion that has often been mooted and never satisfactorily settled, viz., how far the low wages of gardeners prevent them as a class from supporting the Royal Gardeners' Orphan Fund and the Gardeners' Royal Benevolent Institution. A correspondent recently stated in a contemporary that he could not do so on an income of 21s. 3d. a week. A subscriber writing in reply doubts whether he would miss this money, or feel the poorer if he subscribed a penny farthing a week to the Royal Gardeners' Orphan Fund, or fivepence to the Gardeners' Benevolent Institution. Perhaps not; but only the wearer can fairly judge of how and where the shoe pinches. And there can be no doubt that poverty is the plea most generally urged by gardeners for not cordially and generously supporting their own charities. We know that others, such as the election of non-subscribers for pensions over the heads of those who have subscribed for years, and other objections are often urged. But as all these matters and the working of our charities from first to last are in the hands of the subscribers, and the funds are administered with great care and exemplary economy, there is little force or foundation for complaints.

And yet there must be something seriously wanting or rotten in the state of Denmark, that is, the state of feeling and action in regard to these charities, when it can be said that out of the thousands of names of gardeners that appear in the "Horticultural Directory" there are only three hundred practical gardeners who contribute to the Royal Gardeners' Orphan Fund, and of these only thirteen hailed from Scotland, the land of gardeners as of cakes, and still fewer from Ireland; and yet at the same time there are eight—children of gardeners—orphans receiving the benefits of this most excellent charity, at the amount of £104 per annum. After such an apt illustration we must forgive the sting of the reproof given by "Subscriber" for its broad and genial humour, which describes Sandy as a decent man who keeps the Sabbath and everything else he can lay his hands on. But it is really not so. The partial, almost complete, neglect of our charities in many quarters arises from want of thought, and neither from hard hearts or indifference or callousness to the sufferings or wants of others. Gardeners have also left their charities to others too often and too much, leaning too heavily on the guineas of employers, nurserymen and the Press, instead of on their own pence and shillings.

The littles of the many may amount to much more than the muckles of the rich, while they would deepen and widen the areas of feeling and of effort. Were every gardener determined to share the burden and the honour of having a finger in the pie of contributing to or helping to administer our charities, the difficult problem of the suffering and the sorrows of our brothers and sisters in distress and their fatherless children would be as good as solved. If, exclaims "Subscriber," nine out of every ten gardeners in employment subscribed five shillings a year there would be no need of elections to the fund, but ample means would be available for the decent maintenance of every gardener's widow or child.

D. T. F.

Phlebodum glaucum var. Mayi.—This very beautiful form of Phlebodum (Polypodum) glaucum, exhibited by Mr. H. B. May, at the Temple Show, is an extremely interesting one to the British fernist, as representing precisely the same sport in that exotic species as we have in the cambricum form of Polypodum vulgare, viz., the plumose type. It is further remarkable as constituting one of those rare instances of a direct sport from the normal, for which we are usually indebted to nature under wild conditions of growth. If we follow the history of fern sports, home or exotic, we almost always find the beginning to be either a find in our native ferny habitats or an importation from abroad, indicating a similar origin elsewhere. These being introduced and raised from spores other sports or variations follow, but the first or initial step, as we have said, does not as a rule make its appearance under culture. There are, of course, exceptions, as in this case, and it would be strange indeed were it otherwise, considering that very many thousands of ferns are raised every season, and it is therefore only to be expected that if, say one in a million of normal plants sport in a wild state, the same ratio will prevail among those raised under culture. Phlebodium Mayi in sporting thus into a form similar to that assumed by our native species, the Welsh Polypody, emphasises the affinity between them already shown by P. Schneideri, a compound of a variety of our P. vulgare (P. v. elegantissumum) and P. aureum (a very close relative of P. glaucum), but the character of the sports does not, as in that case, establish it as a result of hybridization, since P. v. cambricum is invariably barren, as we predict, will be the new fern in question. We understand that the new batch of young plants, in which this form made its appearance, contained other original sports of the same species in the shape of well-crossed examples, which are now being brought on, and this fact goes far to establish a theory I mooted some time ago, that the faculties of cresting and becoming plumose were closely akin in nature, both being due to an abnormal extension of the cellular development. In the plumose types this is distributed generally throughout the frond expanding the tissue into frills, fimbriations, and so on, while in the crested types it is apical only, and the superabundant energy finds a vent by multiplying these apices, and so forming tassels.—CHAS. T. DRUERY, F.L.S., V.M.H.

HORTICULTURE IN CANADA.

(Concluded from page 302.)

Ottawa Experiment Station.

PASSING now at one bound over a distance of seven hundred and forty-two miles west of Nappan, we find ourselves at Ottawa, the capital. Three miles from the centre of the city lies the central experimental station, consisting of four hundred and sixty-five acres. Ten years ago this land was liberally sprinkled with stumps and stones, and encumbered with one hundred and forty acres of second-growth timber and forty acres of swamp. This has all been cleared and reclaimed and brought into a fair condition of cultivation. About three hundred and thirty acres are devoted to agricultural work, thirty-five acres to the testing of fruits and vegetables, twenty-one acres to experiments with forest trees, nine acres to ornamental planting along the margins of the roads and about the buildings, and sixty-five acres to an arboretum and botanic garden. There is an office building with chemical laboratory below, and overhead a museum of farm products, in which the fruits grown at the several farms make a striking display. Near by are the houses of the chemist, botanist, and horticulturist, about which there are [illegible] pretty groups of trees and shrubs. The conservatory consists of two glass structures, each seventy-five feet long, in one of which there is a fair collection of economic and ornamental plants. In the list of the former will be found tea, coffee, cinnamon, camphor, pepper, cinchona, cocoa, and other plants serviceable to man. There are also collections of orchids and cacti, with palms and ferns, and many of the commoner house plants. Another house is used, during the early months of the year, for testing the vitality of seed grain for farmers and for general propagating purposes. The barn, with adjacent planting, shows that the surroundings of even a barn may be made attractive by a judicious use of trees and shrubs.

Orchards have been planted and are used for testing fruits, and the number of varieties of large fruits under trial here is about eight hundred, and of small fruits about as many more. Many new varieties have been produced on the station, by growing large numbers of seedlings of choice sorts and selecting the best, and by cross-fertilisation. Comparative tests have also been made of a large number of vegetables. A useful adjunct to the horticultural department is the apiary, where the busy bees work all the summer day, gathering stores of honey from the flowers of various plants and trees, and in carrying on their regular work render valuable assistance in fertilising the blossoms of fruits. Some people object to planting trees, fearing they may not live long enough to realise much enjoyment from them. To produce the best results comparatively small specimens should be selected. A young and thrifty tree accommodates itself to change of location much more readily than an older one, and the young tree usually develops its normal form more perfectly.

During the early years of our work collections of bulbs—including lilies, hyacinths, narcissus, and many other sorts—were planted in the autumn; but the ground being open and without shelter, the snow at times was so blown off the ground as to leave it nearly bare and most of the bulbs were killed during the winter. To provide shelter, and collect and retain snow over them, an enclosure hedged with arbor vitæ and Norway spruce was planned and the bulbs placed within it; since then nearly all have wintered well. During the winter the enclosure and its surroundings are protected by snow, which gathers within and about it to a considerable depth. The evergreen margin is now about three and a half feet high, and portions of it are almost covered with snow during the [illegible] part of the season. The beds outside this enclosure afford different [illegible] which make them very suitable for certain classes of plants. Within, a constant succession of bloom during the summer is maintained; hyacinths, tulips, and other bulbs in the spring, and later fine masses of lilies, herbaceous peonies, and irises are grown. The lilacs, when in bloom in the spring, are among the most beautiful of shrubs, and what delightful improvements have of late been made in this old-fashioned favourite! More than sixty varieties are under test at Ottawa, and nearly all are doing well. Charles the Tenth is one of the best; it is very rich in colour, a wonderfully free bloomer, and the clusters of flowers are large. Alba grandiflora is also a good variety; its large white flower clusters contrasting with the rich deep green foliage make it very attractive.

Trees and Shrubs at Ottawa.

A group of Scotch Pines (*Pinus sylvestris*) is a prominent feature in one part of the grounds; this was planted eight years ago. The trees were then [illegible] inches high; now they measure from thirteen to fourteen feet. The rich [illegible] colour of this species, which is well preserved throughout the winter, makes the tree an attractive object at all seasons of the year. The Rocky Mountain Blue Spruce (*Picea pungens*) is one of the most valuable introductions of late years, and ranks among the most beautiful of hardy evergreens. The foliage in some specimens assumes a rich shade of steely blue, most striking in the early part of summer. Many of these trees have been planted in different exposures on the central farm, during the past seven years, and all have proved perfectly hardy. The European Mountain Ash, or Rowan Tree (*Pyrus aucuparia*) is a fine [illegible] on the lawn when well-grown and clothed with branches to near the ground; its beautiful foliage and abundant clusters of white blossoms in the spring, followed by bunches of scarlet berries in the autumn, make it attractive all through the season. The Katsura Tree (*Cercidiphyllum japonicum*) from northern Japan is an interesting tree, which is quite hardy at Ottawa. The unique character of its foliage as well as its handsome form, render it most desirable. The Sweet Chestnut (*Castanea sativa* var. *americana*) is a native of the western part of Ontario, and is grown with some difficulty in the climate of Ottawa. After several failures two or three trees have now become established and are doing well. One of them blossomed last spring. The variegated Dogwood (*Cornus mas* var. [illegible]) is one of the most beautiful shrubs at all seasons of the year. The leaves are richly variegated with white and the variegation is well maintained throughout the season. When speaking of the divisions made of the central farm and the purposes to which the several portions were devoted, I stated that sixty-five acres had been set aside for an arboretum and botanic garden devoted to the testing of trees, shrubs, and plants from all parts of the world. Work was begun in this branch six years ago, and already nearly two thousand species and varieties of trees and shrubs, and [illegible] thousand of herbaceous perennials, have been brought together from [illegible] northern sections of the globe, and are being tested as to their [illegible] climate of Ottawa. Canada was for a long time the only [illegible] colony without a botanic garden. This stigma has now been removed, and it is hoped that this institution at the farm will soon reach that stage of [illegible] which will make it a credit to the country.

Permit me to direct your attention for a short time to a few of the [illegible] specimens on this part of the grounds. The European Larch, [illegible] a very handsome tree, valuable for its timber. It is a rapid grower and [illegible] most graceful drooping habit. The Golden Arbor Vitæ is a [illegible]

[illegible] Arbor Vitæ (*Thuya occidentalis*), in which the foliage assumes a [illegible] yellow hue. This is a brilliant object for a lawn and makes a beautiful hedge. The Pyramidal Arbor Vitæ is another interesting form of the same [illegible], quite pillar-like in its growth. The Austrian Pine (*Pinus austriaca*) is [illegible] evergreen, of fine form and habit, very hardy, and a fairly vigorous [illegible]. A tree in the Arboretum which when planted six years ago was eighteen [illegible] high now stands about seven feet. The Norway or Red Pine (*Pinus* [illegible]) has also a stately habit, but is of softer outline than the Austrian Pine and makes a handsome tree. The Mountain Pine (*Pinus montana*) is a very [illegible] object for a lawn. Its low-growing, bushy habit, with branches close [illegible] the ground, makes it well adapted for localities where space is limited.

The Tartarian or Bush Honeysuckle is a free-flowering shrub and one of the earliest to bloom in the spring, and when covered with its pink or white flowers, or later with its bright-coloured berries, is very pretty. Van Houtte's Spiræa (*Spiræa Van Houttei*) is a lovely [illegible], which, during the latter part of May and early in June, is usually covered with masses of white bloom. In growth it has a pendulous habit, and is very graceful in form. Spiræa bumalda is another species of the same genus, which has an upright form. This is also a free bloomer and is very attractive. The Weigelas are very beautiful shrubs which are not entirely hardy at Ottawa, the new wood being usually killed back more or less by the severe weather in winter. In most instances, however, a sufficient quantity of the wood survives to give a considerable amount of bloom. Seibold's Variegated Weigela has proved one of the hardiest forms at the central farm. It blooms abundantly in its season, and its variegated foliage makes it at all times very attractive. The different species and varieties of Philadelphus (known also as Syringa and Mock Orange) are charming objects for the flower border, and quite hardy. The flowers vary in size from one to two inches across; some of them are single and some double; most of the varieties are richly perfumed. The Snowball (*Viburnum opulus* var. *sterilis*) is an old-fashioned but most desirable species for the shrubbery. During the blooming season it is literally covered with masses of snow-white bloom. V. lantana and V. dentatum are also very valuable hardy ornamental shrubs. The Siberian Cornus (*Cornus alba* var. *sibirica*) is another [illegible] useful and hardy sort. It is a pretty shrub when covered with its flat, [illegible] clusters of bloom in June, and when devoid of foliage during the winter, its brilliant red stems form a beautiful contrast with the white background of snow. The Russian Olive, said to be a hardy form of Elæagnus hortensis var. angustifolia, is a small tree of very graceful habit, with foliage and branches of a charming silvery hue, which is best brought out where it has a background of dark green growth. This is a very hardy tree and endures the severe climate of the north-west plains well, and when in bloom its numerous small yellow flowers fill the air with their fragrance.

Later in the season the Japanese Hydrangea (*Hydrangea paniculata* var. [illegible]) becomes a very prominent object in the collection of shrubs, from the large bunches of flowers so freely produced at the ends of the branches. This species has found its way into public favour very rapidly. Only twenty-three years have passed since this shrub was first introduced from Japan, and during that comparatively brief period its merits have been universally recognised, and it has become one of the most widely distributed and favourite shrubs in cultivation. Populus Berolinensis is a Russian Poplar, and [illegible] of the hardiest species tested. It endures the climate in all parts of Canada [illegible] making a strong and rapid growth. Many thousand cuttings of this tree have been sent out from the experimental farms to settlers in different parts of the Canadian North-west. These strike readily, and soon form handsome trees, [illegible], or hedges. A specimen which was planted in the arboretum at [illegible] six years ago as a small tree now stands over twenty-five feet high. [illegible] enquiries are made every year as to the best sorts of shrubs or trees to plant for hedges. To gain experience and furnish object lessons, many different sorts are being tested for this purpose. Seventy-five varieties, have already been [illegible] as sample hedges, each fifty feet long, and a large proportion of them [illegible] had five or six years' growth. These are proving an attractive feature in connection with the ornamental planting at the central farm.

Experiments in Manitoba.

A journey of one thousand four hundred and thirty-seven miles west, by the Canadian Pacific Railway, brings us to the flourishing town of Brandon, in Manitoba, adjoining which is the experimental farm for that province. It is located [illegible] in the valley of the Assiniboine river, and partly on the heights above the [illegible] which margin the valley. This farm has been greatly improved by the [illegible] of trees, about sixty-five thousand of which have been put out in avenues, [illegible], clumps, and hedges. Most of the hedges have been planted with [illegible] growing trees, such as poplars and willows, and enclose good-sized plots of [illegible]. These hedges grow quite tall, and act as wind-breaks during the summer, and help to collect large banks of snow in the winter, which, on melting, leaves the ground in a very favourable condition of moisture. These plantations have [illegible] examples before the settlers, which many have been induced to follow, and [illegible] has produced gratifying results. Tree planting has been further [illegible] by free distributions of tree seeds, large quantities of which have [illegible] collected, especially of the Box Elder (*Negundo aceroides*) and the Green Ash (*Fraxinus viridis*). These seeds have been hitherto collected in [illegible] valleys and ravines in the bluffs in Manitoba and the territories, and [illegible] the past seven years more than five tons of such seeds have been distributed free by mail, and during the same period about 6,000 packages of [illegible] trees and cuttings have been sent out in the same way to settlers in [illegible]. Last year the native trees planted on the two western experimental [illegible] produced seed freely, and more than a ton of this has been collected for [illegible] during the coming season. An arboretum has been started at [illegible], and there are more than one hundred species and varieti-s of trees and [illegible] which have proved hardy, and many more are under test. A large [illegible] of varieties of flowers have also been tried. Nearly all the annuals do [illegible], and the large amount of sunshine they enjoy there brings many of the [illegible] to a higher degree of perfection, and results in a greater abundance of [illegible] than is usually found in the East. In perennials, the hardy list includes [illegible] pæonies, several species of iris, hemerocallis, aquilegia, aconite, [illegible], and many others. The love of flowers among the people is very [illegible], and many take great pride in their gardens.

Hardy Fruits at Brandon.

While most of the hardier varieties of small fruits, such as raspberries, currants, and gooseberries, are grown with success, all attempts to grow the larger fruits [illegible] in the east, such as apples, crab apples, pears, plums, and cherries, have [illegible]; the trees do not endure the climate. There is, however, one small wild [illegible] Pyrus baccata, with a fruit about the size of a large cherry, which has been [illegible] from the northern part of Siberia, that has proved perfectly hardy, having stood four or five winters without showing any sign of winter killing. This bears fruit very freely, and notwithstanding their diminutive size these tiny apples make excellent jelly, and in their present unimproved state would be much appreciated. Efforts are, however, being made to improve this small crab by cross-fertilising it with many of the hardiest sorts of apples. A large number of these cross-bred seedlings will be ready for planting on the north-west farms in another year. Suitable enclosures are being prepared which will afford the young trees some protection, and within two or three years it is expected that some of these will bear fruit. Similar experiments have also been carried on with Pyrus baccata prunifolia, which has also stood one winter in the north-west without injury, and this fruit is about double the size of that of P. baccata. It is probable that some of these cross-bred seedlings will bear fruit of larger size and improved quality, which will be valuable to the settlers there. These trees are both small and low-branched and well adapted to endure the climatic conditions prevailing in the prairie country.

The wild plum (*Prunus americana*) is found native in different parts of Manitoba, and is common in the valley of the Asiniboine river and in the other river valleys in the southern part of that province. The fruit varies much in size, colour, and quality, some trees producing red fruit and others yellow, and while some of the fruit is but slightly astringent and of fair quality, other samples are scarcely edible. Efforts are being made to improve the wild plum by selection from seedlings grown from the best varieties. It is proposed also to follow this up by cross-fertilising with better sorts. The Sand Cherry (*Prunus pumila*) is also a native of the far west. It is common about the Lake of the Woods, and has been found on the prairies as far west as the 108th meridian, and as far north as Prince Albert, which is about three hundred miles north of the United States boundary. The Sand Cherry is a very variable fruit; the commoner forms are about the size of a large Marrowfat pea, with a disproportionately large stone and astringent flesh, while occasional bushes are found bearing fruit as large as the English Morello cherry, with a much larger proportion of pulp to stone and a superior quality of flesh. Fruits subject to such free variations in the wild state may be expected to improve still more, in size and quality, under the influences attending higher cultivation and cross fertilising. It is believed that the prospects in connection with the efforts which are being made to improve the fruits referred to are hopeful, and that there will in time be produced such varieties as will prove useful fruits to the people of the north-west country.

Assiniboia.

A further journey of one hundred and eighty-five miles over the plains brings us to the experimental farm at Indian Head, in Assiniboia, one of the North-west Territories. This farm is about the same size as that at Brandon, viz., six hundred and eighty acres. When this land was purchased it was a piece of bare prairie, without tree or bush. During the eight years it has been occupied tree planting on a rather large scale has been carried on, and there are now growing on this farm, in shelter belts, blocks, avenues, wind-breaks, and hedges, more than one hundred thousand trees. Difficulties were encountered at first from the very strong winds, which gave the trees a stunted appearance, but these obstacles were gradually overcome, and the trees have now made such a free growth that they protect one another, producing a vast improvement in the appearance of the place, and affording much shelter. Although the climate is more severe here, the experiences had with fruit trees and with forest and ornamental trees, as well as with flowers, are nearly the same as those which have been gained at Brandon.

National Park at Banff.

A further railway ride of five hundred and fifty miles from Indian Head brings us to the end of the one thousand miles of plains which stretch from the easterly part of Manitoba to the Rocky Mountains, and now we find ourselves ascending among the foot-hills, the landscape broken into bluffs and valleys with clumps of wood and park-like openings between them, and after two or three hours' more of journeying, Banff, where the Canadian government has established a national park, is reached. It nestles among the mountains, and the efforts to improve this beautiful spot have been mainly in the way of making roads so as to open up the romantic beauties of the place, and render those points which afford the most striking views easily accessible. As we approach this elegant resting-place for tourists, we pass the "Three Sisters," a lovely group of mountains; also the Cascade mountain, whose bold rocky summit rises abruptly from near the railroad track more than five thousand feet above the valley. This mountain derives its name from a small cascade which dashes down the mountain side, in which it has worn a distinct channel. Some of the most lovely views to be had anywhere in the mountains are to be seen at Banff, where there is a delightful combination of mountain, water, and forest. A museum has been established here by the Government, which contains collections of the mammals, birds, and plants found in the national park.

There are also some beautiful lakes in this neighbourhood. Lake Louise is one of the prettiest. The bright green colour of its waters contrasts strongly with the pure white of the glaciers beyond, while the many-hued cliffs, with various shades of brown on the one side and the deep green of the spruce-clad banks on the other, all help to form a most harmonious and striking picture. Near by, but about a thousand feet higher, Lake Agnes bursts upon the view, with wilder and totally different surroundings.

One more stretch of about four hundred and eighty miles, through wonderfully varied mountain and valley scenery, takes us through to the valleys and delta lands of the coast line. Here we have the coast climate, which, on this part of the shore of the Pacific, is cool in summer and mild and moist in winter; but returning eastward towards the interior, it becomes hotter in summer and colder in winter, with less rain. At Agassiz, seventy miles east of the ocean, the most westerly of the experimental farms is located, in the valley of the Fraser river. Seven years ago this place was a wilderness. Now there are one hundred and thirty acres of land cleared and under cultivation, and about half of it has been planted to fruit, and more than two thousand varieties of fruits are under test there, nearly all of which are doing well. The climate is mild, and suitable for this industry, and nowhere do the plum, apple, cherry, and pear bear fruit in greater profusion. Every variety likely to be of benefit to the country is being tested, so that the fullest information may be available to the settlers as to the best and most profitable varieties to plant. All sorts of small fruits succeed remarkably well here. A very large number of ornamental trees and shrubs are also successfully grown, including some of the more tender varieties, which are not hardy at Ottawa. Flowers also succeed admirably in this moist climate. The Japanese and other lilies grow luxuriantly, and during the flowering season they fill the air with their fragrance.

Conclusion.

I must not trespass further. I have but touched here and there on the almost limitless field covered by my subject. I hope, however, that I have succeeded in showing that horticulture is not entirely neglected in Canada, but that individuals, communities, and governments (both Provincial and Dominion) from one end of the country to the other are striving to help along this good work. While we cannot expect soon to reach that degree of horticulture advancement which we see and admire so much in older and wealthier communities like your own, we are striving to follow in a measure your noble example and to profit by the generous help which you are always ready to give. Your Arnold Arboretum has aided our experimental farm work in a princely manner, and your ever welcome publications are a constant stimulus towards progress. Although not quite under the same form of government, we are of the same stock as yourselves, and the love for and appreciation of the marvellous beauties of Nature brings like pleasure wherever we dwell, whether we acknowledge as our ruler a worthy president or a matchless queen. Horticulture is bounded by no political lines, but in every community where the mind is sufficiently cultured to appreciate the wonderful beauties with which the world is studded, there these lovely trees and shrubs and flowers, which combine so much of grace and beauty, become a perennial source of quiet delight. They are but expressions of the thoughts of the great Creator, who established and sustains the laws which govern their growth and development. Some love for the beautiful in Nature is found in almost every breast, and companionship with such charming objects tends to deepen and enlarge that feeling of admiration, to elevate our thoughts and lead them from Nature up to Nature's God.

OLD GARDENING BOOKS.

OLD GARDENING BOOKS are rapidly increasing in popularity and value, as a natural sequence of the more intelligent appreciation of the labours of those authors who, in bygone days, laboured assiduously, according to their lights, in diffusing information on the art of garden management, and the strong desire of large numbers of horticulturists to become acquainted with the changes that have taken place in the practice that has obtained in the several departments during the past three or four centuries. To those who are interested in the bibliography of horticulture these old works have a fascination that is irresistible, and a list of any considerable proportion of the gardening classics is highly entertaining. It is a rare occurrence to find a large number of the early works on horticulture in any one catalogue; hence that recently issued by Mr. Bernard Quaritch, 15, Piccadilly, W., is of so high a degree of importance as to justify a brief reference to its contents. Altogether between eight and nine hundred works are enumerated, but these include several hundred modern works, such as Andrew's "Heaths," Bateman's "Orchidaceæ of Mexico," Forbes' "Salictum Woburnensis," Curtis's "Flora Londinensis" and *Botanical Magazine*, Siebold's "Flora Japonica," Lawson's "Pinetum Britannicum," Lambert's "Genus Pinus," Hogg and Bull's "Herefordshire Pomona," and Elwes' "Monograph of the Genus Lilium." There are, however, several hundred early gardening books, and the catalogue has a value as containing the most complete list that has yet been published. One of the first of the old books to arrest attention is William Lawson's "A New Orchard and Garden" (1623), a small and exceedingly rare quarto, in which the author tells us that "fruit trees well ordered, may live and live 1,000 yeeres and beare fruit, and the longer, the more, the greater, and the better, because his vigour is proud and stronger when his yeeres are many"; and, in dwelling upon the delights of the orchard, asks, "What is greedy gain without delight but moyling and turmoyling slavery?" Fitzherbert's "The Boke of Husbandry" (1537?) is still more rare than the foregoing, and marvellously interesting. S. Hartlib's "Legacie, or an Enlargement of the Discourse of Husbandry" (1651), wherein we are told on the title-page are "bequeathed to the Commonwealth of England more outlandish and domestick experiments and secrets in reference to Universal Husbandry." It is stated in the "Philosophical Society's Transactions" that "England profited in agriculture to the amount of many millions in consequence of the Flanders industry having been made known by this little treatise." Markham's "Maison Rvstique, or the Covntrey Farm" (1606), "Way to Wealth" (1631), and the "English Husbandman" (1635) are three interesting quartos by this author, who appears to have written several books on widely different subjects, and he evidently had a high opinion of gardening, for in the last named of the three books he asserts that "A garden is so profitable, necessary, and such an ornament and grace to every house and housekeeper that the dwelling place is lame and maimed if it want that goodly limbe." Mascall's "A Booke of the Art and Maner How to Plante and Graffe All Sorts of Trees" (1550), and "The Countryman's Recreation" (1560) are the two most important of the several works of the old author included in the catalogue, and they are both intensely interesting for the light they shed upon the practice of the period. Hugh Platte's "The Jewell House of Art and Nature" (1594), and "Divers New Sorts of Soyle Not Yet Brought Into Any Publique Use" (1594) are two of the most entertaining of the works of this author, who was described by Weston as "The most ingenious husbandman of his age," and withal exceedingly modest. Barnaby Googe's "Whole Art and Trade in Husbandry" is a small black letter quarto, in which he states he "put into English" the "foure bookes of husbandry collected and set forth by Master Conrade Heresbatch," but notwithstanding that he altered and increased the work, he did not think it proper "to take from him the honour and glory of his owne trauaile." In this respect Googe differed materially from some of the old authors. Thomas Hill's "The Proffitable Arte of Gardening" is by no means the least interesting of the works mentioned, for Hill devoted attention to bees as well as gardening, and gave in this work "Pleasant Instruction of the Perfect Orderinge of Bees." To those who are not well acquainted with other than modern garden literature the catalogue will be a veritable surprise, and it is not without considerable regret that the pressure on our space will not permit even the briefest mention of other of these old and and interesting works.

Doronicum caucasicum.—Some very fine masses in beds of the above were seen in full bloom during the past month, in the fine nurseries of Messrs. Methven and Sons, Edinburgh, under the able management of Mr. McKenzie. At that period of the year such a free spread of fine yellow blooms, nearly two inches across, form a welcome contrast to the large plantations of the white narcissus that have enlivened these nurseries for some time. Hardly have the golden daffodils—that "Take the winds of March with beauty"—faded in part, than the doronicums take their place on the field of the cloth of gold. The next most brilliant display in the open here in season is made by a choice collection of Dean's strain of hardy primroses, in an infinite variety of four colours, stature, and fragrance. These deserve a place in every garden, as there is hardly any limit to their rich and varied variety of colour and profusion of blossoming.—D. T. F., *Edinburgh.*

THE BEST GUIDE to the garden for the whole year is the "Gardening Year Book," containing practical articles on the cultivation of Flowers, Fruit, Vegetables, &c. Price 1s, "Gardeners' Magazine" Office, 4, Ave Maria Lane, London.—[ADVT.]

NEW PLANTS.

ALLIUM SCHUBERTI.

THIS is a remarkable allium from Western Asia, producing a [illegible] of from one to two hundred bright rose-red flowers on a scape about a foot high; it is a species of considerable horticultural value. A. Schuberti was discovered in Palestine, in the Plain of Jezreel, by Mr. Schubert, and appears to have been introduced to cultivation by Messrs. Herb and Wulle, of Naples. The ovoid bulb is large and entirely underground; the leaves twelve inches long by two inches broad, acuminate, light green, with slightly darker striations. The pedicels are unequal in length, varying from two to ten inches; the perianth is about three quarters or two thirds of an inch across. This species flowered in a warm border at Kew in June, 1897. *Bot. Mag.*, t. 7,587-8.

MYOSOTIS DISSITIFLORA DYERÆ.

During a long period of cultivation, a fairly common forget-me-not, Myosotis dissitiflora, has improved considerably, and there is a very wide difference now between the wild type and the variety under notice. M. dissitiflora Dyeræ is an exceptionally strong growing and handsome form raised by Mr. E. J. Lowe, F.R.S., Shirenewton Hall, Chepstow, and named in compliment to the wife of the Director of the Royal Gardens, Kew. The loose racemes are many flowered, each flower measuring nearly or about half an inch across, bright blue, yellow corona, lobes rounded. *Bot. Mag.*, t. 7,589.

CROCUS MALYI.

A beautiful March flowering species, having large, spreading [illegible] with yellow throat. Crocus Malyi is a native of the Dalmatian [illegible] was discovered at an altitude of 7,260 feet by Herr Maly fifty years or so ago. The perianth tube is three inches long, while the six spreading lobes are each one and a-half inches in length. In addition to the yellow colouring [illegible] the segments, forming a throat, there are numerous yellow hairs [illegible] orange-yellow filaments. This is a perfectly hardy crocus, and flowers regularly at Kew in March. *Bot. Mag.*, t. 7,590.

RHEUM RIBES.

A handsome rhubarb from Western Asia, notable for its undulated leaf surfaces and for its profusion of inch-long blood-red fruits. R. ribes has long been cultivated in botanic gardens, but is little known to horticulturists, though apparently cultivated by Sherard at Eltham in 1724. It was discovered a hundred and fifty years previously by Rauwolf, an Austrian physician and traveller. The species grows to a height of three to five feet; the leaves are ten to twelve inches broad, orbicular cordaie, bullate between the deeply sunk nerves and veins. The erect panicle of green flowers is not particularly handsome, but the small blooms give place to large oblong-cordate achenes of a bright blood-red hue. *Bot. Mag.*, t. 7,591.

ERYTHRONIUM HARTWEGI.

A very pretty Dog's Tooth violet, with white tipped and yellow based segments to the flowers, and having leaves of a dark green hue, marked with paler green. It is a Californian species, where it was discovered by Hartwegi. It makes a very pretty plant, from four to six inches high, suitable alike for cultivation in pots or in the open border. Under the latter conditions it flowers during March, when flowers of all kinds are greatly appreciated. Each flower is three inches across, and has recurved perianth segments. *Bot. Mag.*, t. 7,583.

DRACÆNA GODSEFFIANA.

A novel dracæna, with rambling, branching stems and handsome spotted leaves. It is a very useful and decorative plant, now becoming well known to horticulturists. It was described and figured in these columns May 25, 1895, pp. 305 and 316. It has a bamboo-like habit, with ternately whorled, elliptic leaves, bright green, freely strewn with irregular white spots. The pale green flowers are borne in ascending racemes at the tips of drooping branches. These are not effective, but they are followed by brilliant red, globose berries, half an inch or more across. This dracæna was discovered by Mr. Henry Miller, curator of the Lagos Botanic Garden, who sent it to Kew in 1892. At a later date it was imported by Messrs. Sander and Co., St. Albans, and named after their manager. *Bot. Mag.*, t. 7,584.

PREPARATION OF MANILA HEMP.

OF late years experiments have been made in British North Borneo in the cultivation and preparation of Manila hemp Musa textilis. Mr. W. [illegible] who is engaged in this enterprise, has communicated some interesting [illegible] *Kew Bulletin*, wherein he states that the best fibre yielding form [illegible] is that known to the natives as "Sayung Lanut pula." When once [illegible] the plantation requires little attention as the suckers provide a succession [illegible] A stem is at its best, so far as fibre production is concerned, when about sixteen months old. Such a stem is composed of overlapping layers of the leaf stalks, somewhat similar to a stick of celery, but firmly bound together. The fibre is found just below the surface on the outer side of these stalks. A stem weighs from fifty to eighty pounds. No machine that I am acquainted [illegible] discovered that will extract it to pay. The native method is [illegible] The stem is cut down and each leaf stalk detached from the others. [illegible] the operator sits down with the end of a stalk in his lap, he then [illegible] incision just beneath the fibre at the end, and giving a smart twitch, [illegible] strip or ribbon of the cuticle with the fibre in it, from the whole [illegible] stalk, much in the same way that the fibrous part of a rhubarb stalk [illegible] when preparing it for cooking. This operation is best performed [illegible] itself, as the discarded portions of the stem remain as manure. [illegible] number of ribbons are obtained they are carried to a hut for [illegible] appliances used for the actual extraction of the fibre are of the [illegible] inexpensive character. A blunt knife is obtained and a hole is [illegible] end of it, through which a string is passed and to which a [illegible] stones are tied. The knife is then attached to a block of softish [illegible] of it pressing on the wood against which it is held by the weight [illegible] stones. Another piece of thin rope or string is tied through the [illegible] knife, running over a bit of wood above it, to a treadle worked [illegible] is now complete. The operator twists the end of one of the [illegible] piece of wood so as to get a firmer hold, and slipping it under the [illegible] blade to descend upon it; a steady pull drags the fibre underneath [illegible] holds back all the pith, weak fibre, and other useless matter. [illegible] heavy, it constitutes a guarantee that all the fibre that is not [illegible] strength, and the result is pure strong fibre. A boy can [illegible] the few inches of the end which was wrapped round the piece [illegible] fibre is then hung over a pole to dry. This is soon done if it is a [illegible] hemp is then ready for market.

EXHIBITIONS AND MEETINGS.

GARDENERS' ROYAL BENEVOLENT INSTITUTION.

On the 8th inst. the fifty-ninth annual festival dinner of this gardening charity was held at the Whitehall Rooms, Hotel Metropole, under the presidency of Sir Oswald Mosley, Bart. There was a large company, although a goodly number of chairs were not filled. Sir Oswald was supported by Mr. Harry J. Veitch, Mr. N. N. Sherwood, the Dean of Rochester, Mr. Atkinson, and others, while in the assembly we noticed such well known horticulturists as Messrs. H. Cutbush, H. Williams, J. Godseff, J. G. Veitch, G. Wythes, T. Manning, J. Hudson, J. Assbee, G. Monro, A. Piper, R. Dean, H. B. May, T. Rochford, Orchard, Glen, [illegible], Smith, Laing, Cannell, Walker, James, &c.

In [illegible] terms the Chairman proposed the usual loyal toasts, and these having been received, he gave "Continued Success to the Gardeners' Royal Benevolent Institution." He regretted the absence of His Grace the Duke of Portland from the chair that evening, and also the cause of his absence—doctor's orders. A letter from the Duke, expressing his sorrow at not being able to be [illegible] and stating his willingness to take the chair on some future occasion, having been read, Sir Oswald, in a short and humorous speech, referred to the great advancement of horticulture in late years, and to the increasing indebtedness of the public to the gardening community. He had given up many kinds of recreation for that of horticulture, and he felt sure many others had done the same. He deplored the smallness of gardeners' wages in many parts of the country, and also the fact that some employers paid their men a short wage during illness, at a time when more, rather than less, money was needed. In view of this he adjured gardeners to assist themselves and each other by means of such institutions as the Gardeners' Royal Benevolent Institution, so that when health failed and employment could be no longer continued they would receive help. The toast was heartily received, and the duty of responding fell upon the treasurer, Mr. Harry J. Veitch. Mr. Veitch heartily thanked Sir Oswald for coming forward so nobly at the last moment to fill the gap caused by the indisposition of the Duke of Portland. It had been his lot to respond to a similar toast for many years past, and each year he had had the satisfaction of stating that the institution was making satisfactory progress; this year he had the same tale to tell, notwithstanding the many calls made during 1897 upon the pockets of the charitably disposed. As an instance of what the institution had done, Mr. Veitch alluded to a pensioner who recently died; her husband had been a subscriber for some sixteen years, and was put on the funds in 1866, he enjoyed a pension until his death in 1875, and then [illegible] widow succeeded him to the benefits of the institution. The husband received £144 from the institution and the widow £314, making a total of £458 received by the couple, who had subscribed fifteen guineas. It was the desire of the com[illegible] to increase the number of pensioners, but to do this they needed an [illegible] subscription list; during the past ten years the sum disbursed annually [illegible] had increased by £100 per year, until now £3,000 a year was needed, [illegible] apart from office and management expenses. Mr. Veitch appealed to the meeting by an increase of donations and subscribtions to enable the committee to meet, [illegible] possible, the increased applications for pensions. He drew attention to three [illegible] for gardeners wherein the wages offered were 15s., 18s., and 21s. [illegible] respectively; and while allowing that many gardeners obtained higher [illegible] this, it showed that, as a rule, the gardener was poorly paid, and [illegible] expected to save any substantial sum after keeping himself and family [illegible]. A run of ill-health, loss of employment, loss of investments as in the Liberator smash, were all matters that had to be considered, for in too many [illegible] these combined to reduce a gardener to a condition when a small pension was of the highest value to him. Mr. Veitch referred to the success of the Victorian Era Fund, a fund started for the express purpose of assisting those applicants for pensions who failed to become elected; only those, however, who had been subscribers previously would benefit by this fund. They needed £1,000 to make up the £5,000 originally asked for, and of this amount £200 had already been promised. The Thomson bequest was referred to as a way by which those in good circumstances might assist the institution, and have their names kept in memory. In conclusion, Mr. Veitch spoke highly of the work carried on by the various [illegible], and stated that now Mr. A. W. Sutton had taken up the matter they might be quite sure a Reading auxiliary would soon be started.

The Very Rev. the Dean of Rochester was received with much applause as he [illegible] the toast of "Gardening." The worthy Dean said that when once [illegible] the subject of horticulture he scarcely knew when and where to stop, especially when talking with or to brother gardeners. Gardeners had, however, to suffer a good deal sometimes at the hands of those who had no horticultural tastes, and who cared little and knew less about the treasures in your garden which they had [illegible] come to see. He argued that the love of gardening was innate in every human heart, and he urged all gardeners to encourage the taste for horticulture by every means in their power. Briefly and humorously the Dean [illegible] his earliest recollections of gardening, his falling away from his first love, [illegible] conversion by a rose; and he incidentally remarked that it was [illegible] years ago since he took part in the first National Rose Show. He [illegible] the "scarlet fever" of bedding out, and expressed his gratitude to those [illegible] in various ways had introduced a more beautiful style of gar[illegible] the decline of formal bedding horticulture had advanced by leaps and [illegible] now no country on the face of the earth had such beautiful flowers, such [illegible] and verdant lawns as ours had. We had many advantages, but he [illegible]. There was a need for more horticulture everywhere, and for [illegible] of arrangement in the gardens. There was no lack of good gardeners [illegible]: what was wanted was more beauty of arrangement, gardens [illegible] could play at hide-and-seek, a place for lovers to dream in, and [illegible] could rest in peace and think; gardens such as Pope wrote about, [illegible] concealed. He was glad that the taste was now taking the [illegible]. Referring to roses, the Dean eulogised the work of Bennett, W. [illegible], and others, and said he thought there was still a great [illegible], especially in the direction of hybrid teas. He had associated with [illegible] of his time in most of the leading recreations, but he still [illegible] statement that in no other body of men was there that [illegible] existed among gardeners of all classes, from the coronet to [illegible]. In America it was the same as at home; the love of horticulture [illegible]. This being so, let us, said the Dean, be "brothers [illegible]," and to help all those needy ones among us, so that we might [illegible] of Him that perished fell upon me, and I caused the widow's [illegible]." The Dean of Rochester was loudly applauded, and the [illegible], Mr. A. W. Sutton, V.M.H., suitably responded, and [illegible], with the help of Mr. Keyser, an auxiliary branch of [illegible] be started at Reading.

[illegible] "Country Friends," ably put by Mr. G. Munro, V.M.H., [illegible] the creation of more auxiliaries, for at present there were eleven counties containing less than ten subscribers each, and three counties containing but one subscriber each to the institution. Mr. G. A. Dickson, V.M.H., of Chester, responded. "The Chairman's Health" was proposed by Mr. N. N. Sherwood, V.M.H., and received with musical honours. Sir Oswald Mosley responded, and gave "The Health of Mr. G. J. Ingram," the secretary of the institution, and at the same time expressed the thanks of the meeting to Messrs. F. Sander and Co., Messrs. J. Veitch and Sons, Messrs. W. Cutbush and Son, Messrs. B. S. Williams and Son, Messrs. W. Paul and Son, Messrs. Paul and Son, and Mr. H. B. May for the beautiful flowers and plants that adorned the tables, and had added so much to the enjoyment of the evening. The excellent musical arrangements were in the hands of Mr. G. Schartau.

The subscription list for the evening was as follows: Duke of Portland, 50 guineas; Sir Oswald Mosley, 50 guineas and £10 annual subscription; Messrs. de Rothschild, 100 guineas; Mr. Colman, 50 guineas to Victorian Era Fund; Messrs. Hurst and Son, £20; Mr. N. N. Sherwood, 50 guineas (V.E.F.); the Sherwood family, 15 guineas; Messrs. Dickson and Robinson, 38 guineas; Mr. A. W. Sutton, 50 guineas; Mr. M. F. Sutton, 50 guineas (V.E.F.); Messrs. J. Veitch and Sons, £20; Mr. Harry Veitch 50 guineas (V.E.F.); Mr. Leonard Sutton, £50 (V.E.F.); Mr. Munro's list, £131; Baron Schröder, £20; Mr. A. Wilson, £20; Lord Wantage, 20 guineas; Mr. W. H. Lees, £21; Mrs. Courage, £25; Mr. Norman, £15 5s.; Mr. Bond, 14 guineas; Mr. Solomons, 10 guineas; Mr. W. Thompson, 20 guineas; Mr. Maycock, £10; Mr. Nutting, 8 guineas; Mr. Brackenridge, 7 guineas; Mr. Cohen, 5 guineas; Mr. Blair, £5; Mr. G. A. Dickson, from £50 to £100 (list not complete); Worcester Auxiliary, £70; Dean of Rochester, £5; Mr. Crump, 20 guineas; Mr. Jinks, £18 10s.; Mr. Denning, £4 16s.; Mr. Baker, 13 guineas; Messrs. Fisher, Son, and Sibray, 10 guineas; Mr. C. Turner, 5 guineas; Mr. B. F. Smith, 2 guineas; Mr. H. J. Adams, 5 guineas; Mr. Wrench, 5 guineas; Mr. H. Richards, 10 guineas; Mr. Corry, 5 guineas; Mr. McLeod, 2 guineas; Mr. Wimsett, 5 guineas; and other smaller sums, making a grand total of £2,305.

ISLE OF WIGHT.

THE monthly meeting of the Isle of Wight Horticultural Improvement Association was held at Newport on Saturday last. Through the indisposition of Mr. F. W. Shirwell, Tonbridge, the hon. sec., Mr. S. Heaton read a short paper on "Bees," and Mr. F. Midlane exhibited and explained various bee-keeping appliances, and for these he received a certificate, as did as did J. E. Watts, Sunbury Gardens, Middlesex, for a patent watering-can. Votes of thanks were given Messrs. C. Collister (Bembridge) and J. Williams (Gatcombe) for their respective collections of acquilegias, Veitch's strain. Dr. J. Groves, B.A., J.P., presided over a good attendance. Several new members were elected at the close of the meeting.

WIDNES PUBLIC PARK COMPETITION.

I WISH to call the attention of intending competitors to the conditions issued by the committee who have this matter in hand. The most objectionable conditions are as follows:—

1st. Only £4,000 is allowed for laying out thirty-four acres of land, fencing in, entrances, and all necessary architectural features, and the formation of a lake and planting. Anyone who has had to do with park formation well knows that this is impossible.

2nd. The committee ask for drawings, which would require at least four double elephant sheets, and in addition to these six perspective views, which are to show the park as it will appear in five years' time. All these drawings are to be in by July 1; showing that the committee do not exactly understand what they are asking for.

3rd. No assessor is named.

4th. If twenty competitors enter the lists the actual cost of their work, including expenses, would amount to £400, or £20 each. For this expenditure the committee offer in premiums the sum of £52 10s.

5th. The committee do not offer to employ the successful competitor. As a matter of information to the younger men, I might add that out of the large number of park competitions I have won in only one instance have I been asked to carry out my design.

THOMAS H. MAWSON,
Architect and Landscape Gardener.
Windermere.

A Disappearing River.—In the St. Mary and Darenth districts of Kent, the inhabitants are becoming concerned at the gradual drying up of the Cray river. Ten years or so ago this was a clear and brisk-running stream, but of late years the springs have become lower and lower, until now the course of the river is dry in some places. The local councils have appointed committees to inquire into the matter, and an official inquiry is being asked for, so that the cause or causes of the loss of water may be discovered, and, if possible, remedied, so that the public health may not be endangered.

The Rating of Glass Houses in Market Gardens.—A meeting of the owners of glass houses in the Dartford Union was, we learn from the *South Eastern Gazette,* held at the Bull Hotel, Dartford, a few days ago, with Mr. Emerson, of Hextable, in the chair. The Chairman said they would have been glad to have left the assessments as they were, but the Dartford Assessment Committee seemed to have formed a conclusion, he did not know upon what grounds, that the horticultural industry was a gold mine. If they had accepted the increased assessments that the Dartford Assessment Committee wanted to impose on the glass houses and nurseries it would have meant almost the annihilation of the industry. Considering the competition that now existed, and was likely to increase, with such conditions as were imposed they could not have made things meet; therefore they were compelled to take the action they did. He traced the history of the appeal, the result of which was that the assessments were reduced sixty-three per cent., or 8s. 6d. in the pound. This successful result had not been brought about without a great deal of expense. Mr. Ayres, Swanley Bottom, gave some particulars showing what benefit they had gained by the appeal. In the first place, it was established that all glass houses should be rated by the amount of land they covered, and the structure not taken into value. A glass house one hundred feet by twelve feet had thus been reduced in net rateable value from 75s. to 42s. 6d., so that a grower having twelve houses of these dimensions would save £25 16s. in rateable value, and if the rate for the year in his parish averaged 5s. in the pound he would save £6 7s. 6d. per year. Mr. Ayres said that thus one year's savings by the appeal would cover the cost of the litigation.

ANSWERS TO CORRESPONDENTS

Editorial communications should be addressed to the Editor of the GARDENERS' MAGAZINE, 148 and 149, Aldersgate Street, E.C.

The Editor will be glad to receive photographs of gardens, plants, flowers, trees, fruits, &c., for reproduction in the GARDENERS' MAGAZINE. He will also be greatly obliged by correspondents sending early intimation of interesting local events relating to horticulture. In sending newspapers containing matter to which they wish to draw attention, correspondents are requested to distinctly mark the paragraph.

Specimens of plants, flowers, and fruits for naming or opinion should be sent to the Editor of the GARDENERS' MAGAZINE, "Endsleigh," Priory Park, Kew, Surrey, and as early in the week as possible. All parcels must be sufficiently prepaid.

Secretaries of horticultural societies are invited to send early notification of forthcoming exhibitions and meetings, and are requested to advise us concerning change of dates.

Passion Flower.—H. H., Weston-super-Mare: You will find an excellent account of the Passion Flower in our issue of March 14, 1896, p. 169. For back copies of the GARDENERS' MAGAZINE apply to the publisher, Mr. W. Allen, 4, Ave Maria-lane, E.C.

Green-fly on Roses.—A. R., Basingstoke: Smartly syringe the rose bushes with fairly strong soapsuds, in which you may put a little tobacco liquor or quassia extract. If your rose collection is small, you will find that a little patient perseverance with syringe and soapsuds will effectually clear away the green-fly. Clear water will also dislodge the aphides, and a dusting of soot beneath the bushes will probably prevent their return.

Removal of Fruit Trees from Garden.—J. D. M., Bury: We presume that yours is a private garden, and not in any sense a market or nursery garden. This being the case, you are not entitled to remove the trees you have planted during your tenancy, unless there was an agreement between yourself and landlord allowing you to do so at the expiration of the lease. If you remove the trees next autumn, without having previously obtained his consent, the landlord can, if he chooses, claim and recover compensation for their removal in the absence of such an agreement as indicated.

Fungus on Gloire de Dijon Rose.—J. M., Cupar. The foliage of your rose tree seems to be suffering from a very severe attack of Asteroma Rosæ, a fungus that occasionally does considerable damage to roses. Unfortunately there appears to be no cure for this disease, and all that can be done is to remove the foliage attacked and burn it, dusting the unaffected leafage, stems, and the surroundings with powdered sulphur. A weak solution of sulphide of potassium may be used occasionally as a preventive, as it will destroy many fungi and not injure the host plant.

Maize.—L. G., Birmingham: It will be perfectly safe to plant out the maize plants now, provided, of course, that they have been subjected to the process technically known as "hardening off." To produce fine cobs for table it is the best plan to grow the plants on in pots, so that they are of large size and in large thirty-two or twenty-four sized pots by the end of May or beginning of June; it is also necessary to plant them in a warm position where keen winds will not seriously affect them. Plant on very rich ground and in a shallow trench or basin so that water may be applied freely and advantageously should the weather become hot and dry—an apparently remote contingency at the time of writing.

Rhubarb Flowering.—Amateur, Derby: It is a bad practice to allow rhubarb to flower unless it is planted in a big shrubbery border or near water, where it is very effective when flowering. In the kitchen garden it should not be allowed to bloom, as this has a weakening effect upon the crowns, and consequently affects the subsequent supply. Very often rhubarb is pulled too freely where there are not many crowns, and thus is the cause of many small plantations becoming weaker year by year, until the stems are not worth pulling. Do not pull any stems until during the first season of growth after planting. Cease to pull rhubarb when gooseberries come into use, and give the stools occasional supplies of water or liquid manure, to assist them in the building up of strong crowns for the ensuing year.

Giant Heracleum.—C. B. M., Newmarket: This is a wonderfully strong-growing umbellifer, and one of the Cow Parsleys. It is a native of the Caucasus, and though known to cultivation since 1820 it has only become popular during recent years since the advent of a more graceful style of gardening. Being such a strong grower it is suitable for bold effects in front of shrubs in very large borders, near streams, lakes, and ponds; indeed, it is most effective and natural when planted near water, where it will grow ten or twelve feet high, bearing huge umbels of comparatively small white flowers. This plant is known sometimes as Heracleum giganteum, but its correct name is H. villosum. With regard to your remark concerning the size of the flower, the cart-wheel comparison no doubt refers to the spread of the big rays of the large umbels, for the individual flowers are small.

Wasps and Tomatos.—J. C. F., Swanage: We have not proved for ourselves that tomato plants form a remedy for wasps, but such is said to be the case, and Messrs. Padgett and Read, of Pocklington, have every faith in them, as shown by a communication published in our columns on p. 331, June 9, 1894. They ask whether any readers have found the growing of a few plants of tomatos in vineries had any effect in preventing wasps attacking the grapes when ripe, and then continue: For the past three years it has been our practice to grow several plants in pots, say, one to every six feet, in front of our vineries. These are trained to a wire running horizontally from end to end of each vinery. The ventilators in general use are about three feet deep. The wire is placed about two feet from the bottom of the ventilator, and about six inches from the glass, and is made fast to the framework of vinery by an iron peg with eye through the end. For the past three years we have never had a single grape touched by wasps, although much of the fruit growing in the garden close by had been destroyed, the grapes in vineries around us also suffering very much. What is more, although wasps were more numerous last year [1893] than for many seasons, we never saw a wasp in the vineries after the tomatos were placed there. It would certainly be well worth while to try this method of prevention, as you are annually pestered with wasps. Whether Messrs. Padgett and Read still continue the plan we are not aware; perhaps they will say.

Failure of Sweet Cicely to Germinate.—K. F., Lincoln: It is very rarely that Sweet Cicely is grown for flavouring, or, indeed, for any other purpose in this country, though one finds it grown fairly often in Continental countries, where its leaves are prized by some *chefs* for their sweetish taste and odour of aniseed. Sweet Cicely (*Myrrhis odorata*) is a native plant, and can be propagated at this season by means of cuttings or division of the roots, provided shade and water are subsequently afforded. If sown in the spring seeds of Sweet Cicely seldom germinate the same year, but the seedlings appear the following spring; if sown in the autumn, however, the seeds germinates freely enough next spring, thus proving that the seeds are best sown as soon as ripe. Ordinary garden soil will suit it, and an out of the way corner will suffice unless there are special reasons for cultivating it extensively.

Peach Leaves Falling.—A. C. R., Eastbourne: Peach houses should not be shaded; indeed, you cannot expect to grow peaches well in a house where permanent shading is afforded and the numerous pot plants are considered before the fruit trees. There are two other reasons why the peach tree is loosing its foliage; owing to the absence of permanent shading upon the top lights the sun reaches the tree suddenly, and while its leaves are covered with moisture generated in the house; this causes the scorching or scalding evidenced by the marks on the foliage. In all probability the peach tree has not had sufficient moisture at the roots since commencing to grow, although there has been plenty of atmospheric moisture; the severe check due to scalding, added to other ills, has caused the heavy fall of foliage. The remedy will be to afford the necessary moisture, light and air, giving the tree some liquid manure to encourage and assist it. Peach trees in pots would probably suit you best, as they could be shifted from house to house, or even outside at this season, and so receive light and air.

Names of Plants.—Under this heading we can only undertake to name species and specific varieties of plants, and not florists' flowers. Specimens should be packed in stout boxes with damp moss or leaves as packing material to ensure their reaching us in a fresh state. It is essential that flowers must accompany specimens of flowering plants, that fern fronds be fertile, and that the numbers be legible and firmly attached to the specimens. We cannot promise to name more than six specimens at one time from any one correspondent.

F. F., Ascot: 1, Phyllanthus glaucescens; 2, Oncidium concolor; 3, Odontoglossum citrosmum.

D. E. P., Chelmsford: 1, Onosma taurica; 2, Dianthus cruentus; 3, Dryas octopetala; 4, Arenaria balearica.

G. S. G., Bristol: 1, Adiantum cuneatum deflexum; 2, A. reniforme; 3, Didymochlæna lunulata; 4, Davallia Tyermanni; 5, Asplenium Belangeri; 6, Rhepidopteris peltata.

H. G., Glasgow: 1, Peperomia resedæflora; 2, Coccoloba platyclada; 3, Croton Hawkeri; 4, Schizanthus pinnatifidus.

C. S. L., Pontefract: 1, Clematis montana; 2, Acer pseudo-platanus; 3, Quercus pedunculata fastigiata.

M. B., Exmouth: Please send the "geranium" when in flower; the other plant is Centaurea montanæ alba.

E. G. F., Warrington: 1, Viburnum plicatum; 2, Kerria japonica flore pleno; 3, Weigela Abel Carriere; 4, Thuiopsis dolobrata.

C. O. R., Maldon: 1, Phlox subulata; 2, Primula farinosa; 3, Polemonium cæruleum; 4, Gloxinia tubiflora; 5, Diplacus glutinosus; 6, Rhynchosperum jasminoides.

H. C. R. L, Hants.: 1, Oncidium crispum; 2, O. Harrisonianum; 3, an Isoloma (Tydea), one of the now numerous varieties raised on the Continent by hybridising and selection; 4, Miltonia spectabilis; 5, Streptocarpus Wendlandi; 6, Cheshunt Hybrid rose.

J. F., Yorks.: 1, Prunus Padus; 2, Pyrus Aria; 3, a sedum; send Nos. 3 and 4 in flower.

MARKETS.

Covent Garden.

SUPPLIES of green vegetables and salading are plentiful and good, but notwithstanding the brisk demand, prices are rather low. Apples from Australia and Tasmania realise good prices, so also do pineapple, oranges, early strawberries, cherries, and apricots. Gooseberries have cheapened considerably, and rhubarb is not now so much in demand.

FRUIT.—Tasmanian apples, 8s. to 15s.; Australian, 10s. to 18s. per case; pineapples, 2s. to 5s. each; bananas, 6s. to 12s. per bunch; English grapes, 1s. 6d. to 3s.; Belgian, 10d. to 1s. 6d.; Channel Islands, 1s. 6d. to 2s. per lb.; oranges, 18s. to 25s. per case; lemons, 6s. to 15s. per case; French strawberries, 1s. 3d. to 3s. per handle basket; French cherries, 2s. to 3s. per square, 9d. to 1s. per small box; Spanish apricots, 1s. to 2s. per box; peaches, 4s. to 12s.; green figs, 3s. to 4s. per dozen; melons, 1s. to 2s. each.

FLOWERS.—Arums, 3s. to 4s.; carnations, 1s. to 3s.; eucharis, 3s. to 4s.; gardenias, 1s. to 3s.; Lilium Harrisi, 3s. to 4s.; tea roses, 6d. to 1s.; pink roses, 3s. to 6s.; red roses, 2s to 4s.; cattleyas, 6s. to 9s.; Odontoglossum crispum, 1s. 6d. to 4s.; and tuberoses, 1s. to 1s. 6d. per dozen blooms; Adiantum cuneatum, 4s. to 8s.; marguerites, 2s. to 4s.; mignonette, 2s. to 4s.; pelargoniums (scarlet), 4s. to 6s.; polyanthuses and cowslips, 1s. to 1s. 6d.; bluebells, 9d. to 1s.; and violets, 9d. to 3s. 6d. per dozen bunches; azaleas, 6d. to 9d.; stephanotis, 2s. to 4s.; lily of the valley, 6d. to 1s.; white gladiolus, 6d. to 9d; and pelargoniums, 4d. to 6d. per dozen sprays; bouvardias, 6d. to 8d.; white lilac, 3s. to 4s. per bunch.

VEGETABLES.—English tomatos, 6d. to 8d. Jersey, 5d. to 6d. per lb.; Canary, 10d. to 1s. 4d. per tray, 3s. to 4s. per case; asparagus, 6d. to 4s. per bundle; beetroots, 2s. to 3s. per tally; eschallots, 1s. 6d. to 2s.; garlic, 3s. to 3s. 6d.; mushrooms, 6s. to 8s. per 12 lb.; Egyptian onions, 6s. per bag; English spring, 1s. 6d. to 2s. 6d. per dozen bunches; endive, 1s. 3d. to 1s. 6d.; lettuce, 6d. to 9d.; cos 1s. 6d. to 2s.; cucumbers, 2s. to 4s.; and cauliflowers, 1s. to 2s. per dozen; mint, 3s. to 4s.; new carrots, 4s. to 5s., turnips, 5s to 6s.; greens, 2s. to 2s. 6d. per dozen bunches; rhubarb, 1s. 6d. to 2s. 6d. per dozen bundles; green peas, 2s. to 3s. 6d. per flat; French beans, 2s. 6d. to 3s. 6d. per basket; Jersey new potatos, 14s. to 17s.; Canary, 10s. to 12s.; Malta rounds, 8s. to 10s. per cwt.; Lisbon rounds, 5s. to 5s. 6d. per box.

Borough Potato Market.

There is a brisk and increasing demand for new potatos, but supplies are now daily growing larger, consequently prices have a downward tendency. There is a moderate trade in old potatos. Dunbars, 130s.; Scotch Magnums, 120s.; Bruce, Main-crop, Sutton's Regents, Reading Giants, and Saxons, 110s. per ton; Belgians and Germans, 4s. 6d. to 5s. 3d. per bag. New—Maltese rounds, 7s. to 8s.; Teneriffe kidneys, 8s.; St. Malo, 10s.; Jerseys, 11s. per cwt.; Lisbon rounds, 4s. per box.

OBITUARY.

Mr. Stephen Spooner, of the Hounslow Nurseries, died, we regret to record, at his residence at Hounslow, on the 3rd inst., in his seventh-fifth year.

ENGAGEMENTS FOR THE ENSUING WEEK.

MEETINGS.

Tuesday, June 14.—Royal Horticultural Society; Committees meet at 12 o'clock; Lecture upon "Hybrid Orchids," by Mr. G. O'Brien, V.M.H., at 3 p.m.

Wednesday, June 15.—Yorkshire Fête and Gala; three days. Lecture at Chiswick Gardens by the Rev. Professor Henslow upon "The Importance of a General Knowledge of Vegetable Physiology to Cultivators."

Thursday, June 16.—Linnean Society Meeting. Colchester Rose and Horticultural Society. Carisbrooke Rose Show.

Friday, June 17.—Royal Botanic Society Lecture.

Bradford	66·0	39·4	50·7	10·39	0·51	1·30
Hull	—	—	—	—	—	—

The mean reading of the Barometer during the week at Greenwich was 29·66 inches, and that of the Thermometer 51°·9, the latter being 5°·4 below the week's average in the 50 years 1841—90. The direction of the wind was westerly, the horizontal movement of the air being 29 per cent. above the week's average in the 16 years 1860—75. The duration of registered bright sunshine in the week was 26·4 hours. The measured rainfall amounted to 0·61 of an inch.

Mr. G. W. Cummins, late head gardener to A. H. Smee, Esq., The Grange, Carshalton, has been appointed head gardener to W. H. Lumsden, Esq., Balmedie, Aberdeenshire.

REAPING AND SOWING are the two most important periods in the life of the farmer, and granting that all circumstances are favourable, he naturally, during the latter period, hopes to get an adequate return for his labour. As he sows, he expects to reap, and unless constant industry has been exercised, the harvest is generally a poor one. So it is with regard to health, if we are not constantly on the watch and destroy the germs of disease as soon as they are discerned, the body becomes weakened, and at last is unable longer to resist the attacks of the enemy. Holloway's Pills destroy even the most minute traces of disease, by purifying the blood and strengthening the system.—[Advt.]

Lists and samples free.—A. Potter, Melbourne Netting Works, Wolverhampton. Maker to the Queen and Prince of Wales.

WEST'S
PATENT
IVORINE
PLANT LABELS

The "Ivorine" Writing Disc, being made of a Selluloid and Xylonite composition, is imperishable, and does not corrode or eat away, like wood and metal labels; and being ivory-white, when written upon it shows to perfection. And also, as the writing is on the Ivorine itself it is permanent, though washable, and does not become unreadable like all other labels, for hitherto all labels have been painted, as the paint gets old. It is for labelling every description of goods when used with or without the wires, and will last a century, either in a greenhouse, in a wine cellar, or out in a garden, and not only is it always ready for use, and may be written on both sides, but the name when written in pencil may be easily rubbed off, and so used as many times as desired.
Samples and Lists of the West's Patent Specialities post free. Price, 9d. per dozen; 8s. per gross, complete; 7s. per gross without wires, Carriage Paid. Size a little larger than illustration, and wires 2 ins. longer from loop. (See List for other sizes). Special ink, if required, in 6d. bottles, per post.
Supplied by all Nurserymen, Florists, &c.

Crown 8vo., cloth, lettered in gold and colours. Price 3/6.

THE AMATEUR'S GREENHOUSE and CONSERVATORY.

—*Illustrated with Engravings and Coloured Frontispiece.*—By SHIRLEY HIBBERD. A Complete Guide to the Construction, Heating, and Management of Greenhouses and Conservatories, and the Selection, Propagation, Cultivation, and Improvement of Ornamental Greenhouse and Conservatory Plants.

"This book is well adapted for amateurs. It points out, in its earlier chapters, the main considerations which affect the construction and heating of conservatories and greenhouses. In the fourth chapter the amateur is initiated in potting, composts, propagation, etc. Then follows a [illegible] of chapters in which the treatment of the different groups and families is explained, Greenhouse Herbaceous Plants leading the way, followed by the Chrysanthemum, to which a chapter is given; Soft-wooded [illegible] Pelargoniums; Fuschias; Hard-wooded Plants; Ericas and [illegible] Camellias, Azaleas, and Rhododendrons; Climbers; Oranges, etc. Hard-leaved Plants, as Agaves, Dracœnas, etc. Succulent-leaved Plants; Orchids and Pitcher Plants; Greenhouse Roses, etc. One chapter is devoted to a general selection of Greenhouse Plants; another to Summer Cucumbers and Seedling Pelargoniums; while others afford reminders of monthly work. The volume is nicely printed and elegantly bound; and, so far as we have had the opportunity of testing it, seems to be sound as to its practical recommendations."—*Gardeners' Chronicle.*

Fcap. 4to., cloth, bevelled boards, lettered in gold and colours. Price [illegible]
By SHIRLEY HIBBERD.

THE IVY.—A Monograph.

—*Illustrated with Coloured [illegible] and Wood Engravings. Small quarto, handsomely bound, cloth, gilt.* Comprising the History, Uses, Characteristics, and Affinities of the Plant, and a Descriptive List of all the Garden Ivies in Cultivation.

PRACTICAL LANDSCAPE GARDENING
and ESTATE DEVELOPMENT CO.

This Company undertakes to advise as to the laying out of gardens, the general improvement of landed property, and the development of building estates; to provide plans and estimates, and, for a fixed sum, to carry out all work incidental to the making of the smallest Villa garden as well as to the designing and execution of the most extended estate improvements.

It has a staff of experienced foremen, and all necessary plant.

No charge whatever is made for plans, which, however, remain the property of the Company unless the work is carried out by it.

All communications to be addressed to—

ESTATE DEVELOPMENT CO.,

NATIVE GUANO.

BEST AND CHEAPEST MANURE FOR GARDEN USE.

Price **£3 10s.** per ton in bags. Lots under 10 cwt., **4s.** per cwt., 1 cwt. sample bag sent carriage paid to any station in England on receipt of P.O. for **5s.**

Extracts from 22nd annual collection of reports:—

NATIVE GUANO FOR POTATOS, VEGETABLES, &c.

C. H. TINDALL, Bardney: "Used for Potatos. Result very satisfactory; yield much above average. A splendid manure." G. WATTS and SONS, Bournemouth, report: "Good for general purposes. Grand for all Root Crops, Tomatos, and Cucumbers. Find it so cheap; and it does not exhaust the ground like other manures."

NATIVE GUANO FOR FRUIT, ROSES, TOMATOS, &c.

E. F. USHER, Sidcup: "Potatos and carrots, splendid crops; Peaches, Nectarines, &c., splendid. Should not like to be without it on any consideration" G. STONARD, Gardener to Sir A. T. Watson, Bart.: "Used for seven years for Peaches, Grapes, Tomatos, Cucumbers, Roses, and Chrysanthemums with excellent results."

Orders to the **Native Guano Co. (Limited)**, 29, New Bridge Street, Blackfriars, London, where pamphlets of testimonials, &c., may be obtained. Agents Wanted.

PRICE 6s.

RUSTIC ADORNMENTS FOR HOMES OF TASTE.

BY THE LATE SHIRLEY HIBBERD.

New and Revised Edition by the Editor of AMATEUR GARDENING.

"This new and revised edition maintains its [illegible] something more than an ordinary amateur's guide; it is practical work brought up to date so as to keep abreast of the fashion and taste as displayed in the floral decorations of the table, the home, and the garden. This work would make a useful present to anyone."—*The Bazaar, the Exchange and Mart.*

"We cannot imagine a more appropriate [illegible] book than this to persons who delight in flower and attractive home surroundings. It is worthy a place in any 'home of taste.' It abounds in useful practical hints, and is eminently readable from end to end."—*Journal of Horticulture.*

W. H. and L. COLLINGRIDGE, Aldersgate Street, London.

NOTICE TO ADVERTISERS.

Owing to the continued increase in circulation, the "Gardeners' Magazine" now goes to press on Wednesday. No advertisement can be guaranteed insertion, or altered, unless received before Four p.m. on that day.

NOTES OF THE WEEK.

A USEFUL OBJECT LESSON.

THE difficulties that now beset the once flourishing Chrysanthemum Society, which has its headquarters in the historic borough of Kingston-on-Thames, are of something more than local interest, for the society occupied for a considerable period, a position of commanding importance and exercised an enormous influence for good upon the development of chrysanthemum culture in the United Kingdom, and at a time when a stimulus was much needed. The importance of the work that has been accomplished by the Kingston Society would fully justify our making some reference to its present unfortunate position; but it has other claims for consideration, and chief among these is the proof it affords of the correctness of the views to which we have so frequently given expression in discussing matters relating to the welfare of horticultural associations. We have again and again protested against their excessive multiplication; we have strongly advised committees to avoid the clashing of dates, whenever practicable; and we have urged the importance of introducing new features with a view to sustain the interest of the general public. We have, on more than one occasion, had a fear whether our readers might not consider that we were unduly labouring these points, but the necessity for keeping them prominently before those interested, has been abundantly justified in various parts of the country. When the Kingston Chrysanthemum Society was founded, the importance of a vigorous policy was fully recognized, and chief among the features introduced was the competition for a valuable challenge vase; and the annual contests created so much interest that visitors flocked to the place of exhibition in large numbers. As one vase was won, another was provided; but, unfortunately, the importance of introducing new features was overlooked, and each of the vases during the long period over which the competition extended was offered for precisely the same number and classes of blooms. It is, therefore, not surprising there should have been a material decline in the interest evinced in the exhibition. This decline was, it may be assumed, further accelerated by holding the shows on the same dates as those of the National Chrysanthemum Society, and it is difficult to understand why the Kingston Committee should, year after year, have failed to recognise the risk of allowing their shows to clash with the gatherings of their formidable rival in the metropolis. The Committee may have selected the dates the best suited to the district, and have fixed them in advance of the announcement of the fixtures of the National Chrysanthemum Society; but the results have been the same, and we have further evidence of the importance of neighbouring societies avoiding a clashing of dates. There can be no doubt that the last-named body has proved a formidable competitor to the Kingston Society, but it is probable that the competition has been less injurious than that of the numerous small associations that sprung up within a few miles of the borough shortly after the society in question had made its mark. Some of these had a short existence, but they must have had the effect of diverting a considerable sum of money that annually flowed into the Kingston exchequer into other channels. We do not pretend to an acquaintance with the minor details of management, nor is it necessary we should do so, as our object in referring to the position of the society is to show how the strongest of horticultural associations may lose ground by a want of appreciation of the importance of the three important points to which we have given prominence. The restoration of the Kingston Society to a prosperous state is a question that immediately concerns the borough, but having regard to the great excellence of its work in the past, we hope the efforts now being made on its behalf will meet with abundant success.

THE MOCK ORANGES.

THE ivory white flowers of Philadelphus coronarius, which are so aptly described by Mason as "yielding but in scent to the rich orange," now festoon their slender branches and contribute their full share to the attractions of the shrubbery, and once more remind us of the value of that group of shrubs of which the species mentioned is one of the best known. It would be hardly correct to describe the mock oranges, as the species of philadelphus are popularly known as neglected in the sense that they are not generally planted, but it would be quite correct to apply that term to the method of cultivation. Like the common lilac, the more vigorous of the species are well able to hold their own in competition with other shrubs of a similar habit, and in consequence of this they are left to do the best they can in the struggle for existence, instead of receiving the attention they so well merit from the cultivator. More attention to individual plants rather than an increase in numbers is desirable in the case of the well-known species and varieties, for unless they have sufficient room for their development they fail to fully display their great beauty. Philadelphus coronarius is a native of south Europe, and is widely distributed, as indicated by the great difference of opinion that existed between the earlier botanists as to the native place of the shrub. Linnæus states that he found it growing freely in the vicinity of Verona. Ray records having seen it on Mount Salevi, in Savoy, while other authors met with it in other parts of Southern Europe. It was familiar to the Greeks, and it would be difficult to say when it was introduced to English gardens. It is not mentioned in Turner's "Libellus," published in 1538; but it is included in the first edition of Gerard's "Catalogue of Plants" (1596), and in his "Herball" (1597) he states that it was then "growing in my garden in great plentie." Gerard had evidently no great liking for the odour of the flowers, for he observes: "In my judgment they are too sweet, troubling and molesting the head in a very strange manner." He further relates how, having laid some flowers in his bedroom window, they emitted so powerful an odour that "they awaked me from sleep so that I could not take any rest until I had cast them out of my chamber." There are two double forms of this species, of which that known as P. coronarius Keteleri, fl. pl., is the best. P. Gordonianus and P. grandiflorus, both of which were introduced from the United States during the first half of the present century, are of great beauty, and have much larger flowers than those of the first-named species, and these are produced at a later period of the summer. In contrast to the foregoing, all of which make large shrubs, we have the elegant P. microphyllus, introduced from New Mexico about fifteen years since. This is of small growth, and produces an abundance of medium-sized pure white flowers, but is less hardy than the stronger growing species. Of late years these shrubs have received the attention of the hybridist, and already a trio of beautiful forms have been introduced to commerce. These are known respectively as Boule d'Argent and Gerbe de Neige, which are becoming known, and Mont Blanc, which was exhibited for the first time in this country at Westminster on Tuesday. These hybrids are distinguished by their neat growth and profusion of flowering, and should prove of value for the supply of flowers under glass early in the year.

IMPROVEMENT OF PASTURES.

ALTHOUGH the maintenance of grass lands in a fertile condition is by a considerable proportion of cultivators regarded as of less importance than the provision of a good tilth and a liberal supply of plant food for crops grown on arable land, no such distinction is justified. When the grass is eaten off by cattle, very moderate dressings of manure will suffice to maintain the fertility of the land, as a portion of the constituents will be returned to the soil. But when the grass is converted into hay and consumed on another part of the holding, or sold, large quantities of the constituents of plant food are wholly removed, with the result that the soil becomes impoverished, and with an impoverishment of the land there is a deterioration of the herbage and a diminution in the bulk. On the other hand, with the restoration of fertility there is a rapid improvement in the quality of the produce, as well as an increase in the bulk; and one of the most striking examples of the importance of maintaining the soil of meadows in a high state of fertility that has yet come under our notice was met with at Swanmore Park the other day. Three or four years since, Mr. Molyneux, who has occupied the position of head gardener to W. H. Myers, Esq., during the past two decades, added to his other responsibilities the management of the home farm, which includes a considerable area of meadows. Finding in some of these a less vigorous growth of grass than was desirable, Mr. Molyneux decided to apply to a portion of the pastures a dressing, consisting of basic slag and kainit, at the rate of twelve cwt. to the acre, the proportions being one ton of the latter to two tons of the basic slag. The effect of this application is now evident to a casual observer, for the vigour of the grass has been increased to a remarkable extent, and the clovers, which were sparingly represented in the herbage now form an important part, and must add materially to its value. Both these fertilizers are comparatively inexpensive, and as they will continue to exercise an influence for two or three years, the annual cost will be trivial. The soil at Swanmore is rather strong, and therefore the basic slag is more effective than it would be in the case of light soils, but there can be no question that the experiment so successfully conducted at Swanmore Park might be repeated with advantage on many other holdings, for poor pastures are not pleasing to the eye or satisfactory to the pocket.

Lateness of Rose Season.—In consequence of the abnormally low temperature of the past six weeks roses have made so slow a growth that but few blooms of the hybrid perpetuals, hybrid teas, and teas have as yet attained their full development, and considerable apprehension is naturally felt with regard to the success of the earlier exhibitions of roses. The Council of the Royal Horticultural Society have very wisely decided to postpone the rose show, arranged to be held at the Drill Hall, Westminster, on June 28 to July 12. One of the leading rosarians in Ireland informs us that the roses in the North of Ireland are about a fortnight later than usual, and a member of one of the leading firms in Scotland, whom we had the pleasure of meeting the other day, in taking a somewhat humorous view of the situation, said that the present rate of progress in the rose quarters suggested that they would give a good supply of blooms in November. The National Rose Society's exhibition at the Crystal Palace on July 2 will probably be one of the best of the metropolitan shows held of recent years, as the date appears likely to be suitable for growers in the South and the Midlands. At the meeting of the National Rose Society on Tuesday, in the course of a discussion at the close of the business, Mr. G. Paul expressed the opinion that the hybrid teas would be highly satisfactory this season, for in no previous year had they appeared so promising in advance of the season of flowering as is now the case; let us hope this promise will be amply fulfilled.

Chiswick Lectures.—The first of the series of lectures in the gardens of the Royal Horticultural Society was given by the Rev. G. Henslow on Wednesday, and proved, we are pleased to state, a gratifying success. That the lecture would be of the highest excellence was a foregone conclusion, for as a lecturer on botanical subjects Mr. Henslow has but few equals and no superior, and the only point about which there could be any doubt was the attendance, and this was remarkably good. Some sixty or seventy young gardeners, with a few Fellows of the society, were present. Mr. Henslow dealt in his lecture with the leading points in the physiology of plants, and in the course of a masterly address described the chief functions of the roots, stems, leaves and flowers, and showed how a knowledge of these would materially assist the gardener in carrying on his work. In referring to the work that had been accomplished by scientists, and the valuable assistance they had rendered the cultivator, Mr. Henslow pointed to the importance of gardeners closely observing and of recording everything likely to be of value to the scientist in his investigations of the various problems of plant life. At the close of the lecture William Marshall, Esq., who presided, expressed the hearty thanks of the meeting to the lecturer, and the pleasure he felt in seeing so large a number present, and hoped that they would inform their friends of the lectures, as it was desirable that the largest possible number should have the opportunity of hearing them.

A Successful Lady Gardener.—A portrait of Miss Annie Gulvin, who has the distinction of being the first woman to take charge of a garden on exactly the same terms as a man, is given in the current issue of the journal of the Kew Guild. Miss Gulvin, who left Kew in January, 1897, to take charge of the gardens of J. Brogden Esq., Iscoed, Ferryside, South Wales, has contributed to the journal a short account of her first year's experience as a head gardener, and from this we gather that she has been successful in overcoming many difficulties, and has had the pleasure of winning a first prize for vegetables, and having had her salary raised £10 a year. The kitchen garden has an area of five acres, and contains four vineries and an orchard house, and the staff comprises a lady assistant and four men.

The Kingston Chrysanthemum Society.—Mr. A. Dean writes: "Although almost from its origin to now I have taken great interest in the welfare of this society, and have attended every annual exhibition for the past twenty years, yet, perhaps, my interest in its proceedings is greater now, because, having been recently urged to become a member of the executive, I have agreed, subject to certain conditions. When a good ship is in danger of sinking only the rats leave it, and it is then a proper time for those who have real interest in its welfare to do their best to help to save it from being wrecked. The Kingston Society is, I think, the oldest in the county of Surrey; certainly not so many years back it was the leading chrysanthemum society of the kingdom. It is not so now by a long way, none the less every effort should be made to keep it up to its earlier high status. It is now heavily in debt to its secretary and collector. Realizing that the committee have been compelled to reduce the prize list somewhat, but seeing how great a pull exhibitors have had out of the society in years past, that should be rather a reason than otherwise why they should give the old ship all the support they can. To help to that end we want to see a first-rate show presented next November; it will not clash with the National, but will take place on the 1st and 2nd. Kindly let me ask both trade and private growers to bear Kingston in mind, and help the committee to make a splendid exhibition worthy of the old town and of the queen of autumn flowers."

Club-Root Disease.—At a recent meeting of the Chicago Florists' Club, Mr. G. Stollery stated that he had failed in his attempt to grow sweet peas because of the plants having been attacked by the fungus causing club-root disease. He also reported that he had considerable difficulty in cultivating the McGowan carnation, because of its being attacked in a similar manner. Mr. Stollery said cabbage had been grown for many years on the ground he now occupies, and he believed that the attacks from which his sweet peas and carnations had suffered were due to the spores remaining in the soil. As there is no record of Plasmodiophora brassicæ attacking either sweet peas or carnations it is of some importance that the club-root from which Mr. Stollery's plants are suffering should be fully investigated, with a view to ascertain whether the disease is caused by the plasmo-diphora, and if not the identity of the f ungus to which the mischief is due.

New Offices of the Royal Gardens, Kew.—Offices for the curator and assistant-curator, a library and meeting room for the gardeners, and an official residence for the assistant-curator have been provided in the large house which stands in the east corner of the melon ground. This building, formerly a private residence, and known to Kewites as Bell's House or Descanso Lodge, is stated in the journal of the Kew Guild to have been the official residence of Director Aiton. The room—a very large one—which is now the gardeners' library, was in Aiton's time the king's room, having been built by George III. for his convenience when visiting his garden. The term melon ground indicates that this part of the garden contained the fruit houses when George III. was king.

A Royal Rose.—At the exhibition of the Royal Botanic Society, held on the 10th inst., their Royal Highnesses the Prince and Princess of Wales were present, and, in addition to awarding the prizes to the successful competitors in the Floral Parade, made a tour of the exhibition, and especially admired the roses. The Prince of Wales was graciously pleased to name one of Messrs. W. Paul and Son's new seedling roses "The Alexandra," and to accept blooms of it. The Prince also specially admired the Waltham Cross variety Empress Alexandra of Russia.

The Newcastle-upon-Tyne Flower Show.—As already announced this show will be held in conjunction with the Northumberland Agricultural Show in the Recreation Ground on July 13, 14, and 15. This will be one of the largest exhibitions ever held in the North of England. A deputation from the council of the Royal Horticultural Society will travel from London to visit the show and make awards. Several prominent nurserymen from different parts of England have made applications for space.

The Gardeners' Company.—At the recent meeting of this company Mr. Samuel Harmer was admitted to the freedom and livery with the ancient formalities. On the motion of Mr. N. N. Sherwood, the retiring Master, Sir William Farmer was elected the Master, Mr. Philip Crowley the Upper Warden, and Mr. R. [illegible] the Renter Warden for the ensuing year; and, on the motion of Alderman Sir Marcus Samuel, a hearty vote of thanks was passed to Mr. N. N. Sherwood for his services as Master during the past two years. Mr. Gofton Salmond announced the receipt of the following donations for scholarships: £50 from Lord Amherst for the Amherst Scholarships for 1899 and 1900, and £25 from Mr. H. Wood, a member of the court, for the scholarship for 1901.

The Horticultural Building of the Trans-Mississippi Exhibition, which opened at Omaha, U.S., on June 1, is one of the most handsome buildings that has yet been erected for the display of the products of the garden. It is described in (American) *Gardening* as "a magnificent central feature." The building is three hundred and ten feet long by one hundred and thirty feet wide, and one hundred and six feet high, to the belfry. The building is devoted to the floral, fruit, and forestry exhibits, and is admirably adapted for the purpose, the high dome, covered with glass, permitting the exhibition of the tallest ornamental plants. In the centre of the dome is placed the crystal cave, in a pyramid of rocks covered with mosses and flowers and down the sides of which trickle countless little streams to the pool below. This pool is surrounded by a double colonnade with vaulted arches, forming a grand circle. Unrestricted as to motive, or form and surroundings, the architect has succeeded in producing a building singularly striking in its effective features. The basis of design is the chaste Ionic. The details are modelled from flowers, fruits, and foliage. On either side of the stately central entrance are towers, or rather mosque-like minarets. This feature is reproduced on all sides, forming an octagon from which springs the dome. Between these minarets are placed circular colonnades, surrounded by statuary emblematical of the seasons. Above the dome is an open observatory balcony from which can be obtained a grand view, not only of the exhibition grounds, but of the city and adjacent lakes, the picturesque valley of the mighty Missouri, and the lovely city of Council Bluffs, five miles away. Above this open balcony is the belfry. At the ends of the wings are octagonal-roofed pavilions in harmony with and emphasising the general form of design. The wide frieze is beautifully ornamented with cupids, in riotous revelling amid fruits and flowers. On either side of the main entrance, on high stylobate, are placed groups of statuary representing "Night" and "Morning," festooned, the one with Morning Glory and the other with night blooming cereus. The building is profusely decorated with flower urns, hanging baskets, and ornamental plants of every description from semi-tropic climes.

Sweet Peas have attained to so high a degree of popularity in the United States that there is a probability of the flower having a society wholly devoted to it. The Rev. W. T. Hutchins says that an attempt will probably be made at Springfield in July next to launch the association under the designation of the American Sweet Pea Society, and he expresses the opinion that there is now sufficient working force in America on the sweet pea to make the society thoroughly national in character.

New Roses—We have received from Messrs. Dickson and Sons, Newtownards, two coloured plates illustrating the five new roses they are distributing this season for the first time. These comprise two teas, two hybrid tea roses, and one hybrid perpetual. The two hybrid teas are known as Daisy and Killarney, two charming varieties of finely formed flowers of different shades of pink. The two teas, named respectively, Beryl and Meta, have rich yellow flowers, those of the former suffused with saffron and rose, and thus especially desirable for garden decorations and the supply of cut flowers for indoor decorations. Ards Rover is the name of the hybrid perpetual and it has finely formed flowers of a deep crimson colour, and so vigorous a habit as to be specially useful as a climbing and pillar rose.

Something Like a Consumer.—The following question is submitted in the pages of an agricultural contemporary by a correspondent who evidently has consumptive powers of a high order: "Being a consumer of country produce to the extent of about 12 tons of potatoes, 13,000 eggs a-year, and paying about £1 6s. a-week for milk, besides using butter, bacon, fruit and vegetables, rabbits and fowls, pork, beef, and mutton, do you think it would be advisable for me to take a small farm and try and supply my own as far as possible?"

An International Chrysanthemum Exhibition will be held at Lille from November 10 to 15. The several chrysanthemum and horticultural societies in the north of France have combined their forces in the organisation of the gathering. Communications regarding the exhibition should be made to the Secretary General, 19, Rue de Pas, à Lille, France.

The Date Industry of Bussorah.—The largest export of dates in the world takes place from Bussorah, situate some seventy miles up the River Shutt-el-Arab, a river formed by the combination of the rivers Tigris and Euphrates. The date season in Bussorah begins, according to the earliness or lateness of the crop, in the early or middle part of September, and lasts six or eight weeks. Consul L. A. Forbes, in a communication relating to the crop of 1897, says that the crop was ready for packing about the middle of September. At a meeting of growers and buyers, held when the dates are ready for packing, the prices are fixed; the first prices demanded in 1897 were respectively £20, £16 9s., and £10 12s. per 50 cwt. for the three qualities of fruit known as "Hellawis" (best), "Khedrawis" (seconds), and "Sáyers (inferior). These prices would appear to be too high considering the decline in consumption of dates in the United Kingdom, and a combination in London to control the prices and importations has been suggested to prevent serious losses. The quality of the 1897 crop seems to have been exceptionally good, although the quantity was somewhat less than last season, owing to excessive heat about the time the crop was entering into the ripening stage which caused the fruit to dry up and fall. Some gardens were also affected by blight, which caused much fruit to drop off before being matured. It is said that about 750,000 cases of ½ cwt. each were shipped from Bussorah for London, New York, and other places. Besides the shipment of dates in boxes a large quantity is exported in baskets to India and its dependencies. These dates are generally of the inferior qualities, and are transported in native sailing craft.

NEW PLANTS AND FLOWERS.

LÆLIO-CATTLEYA EUDORA SPLENDENS.

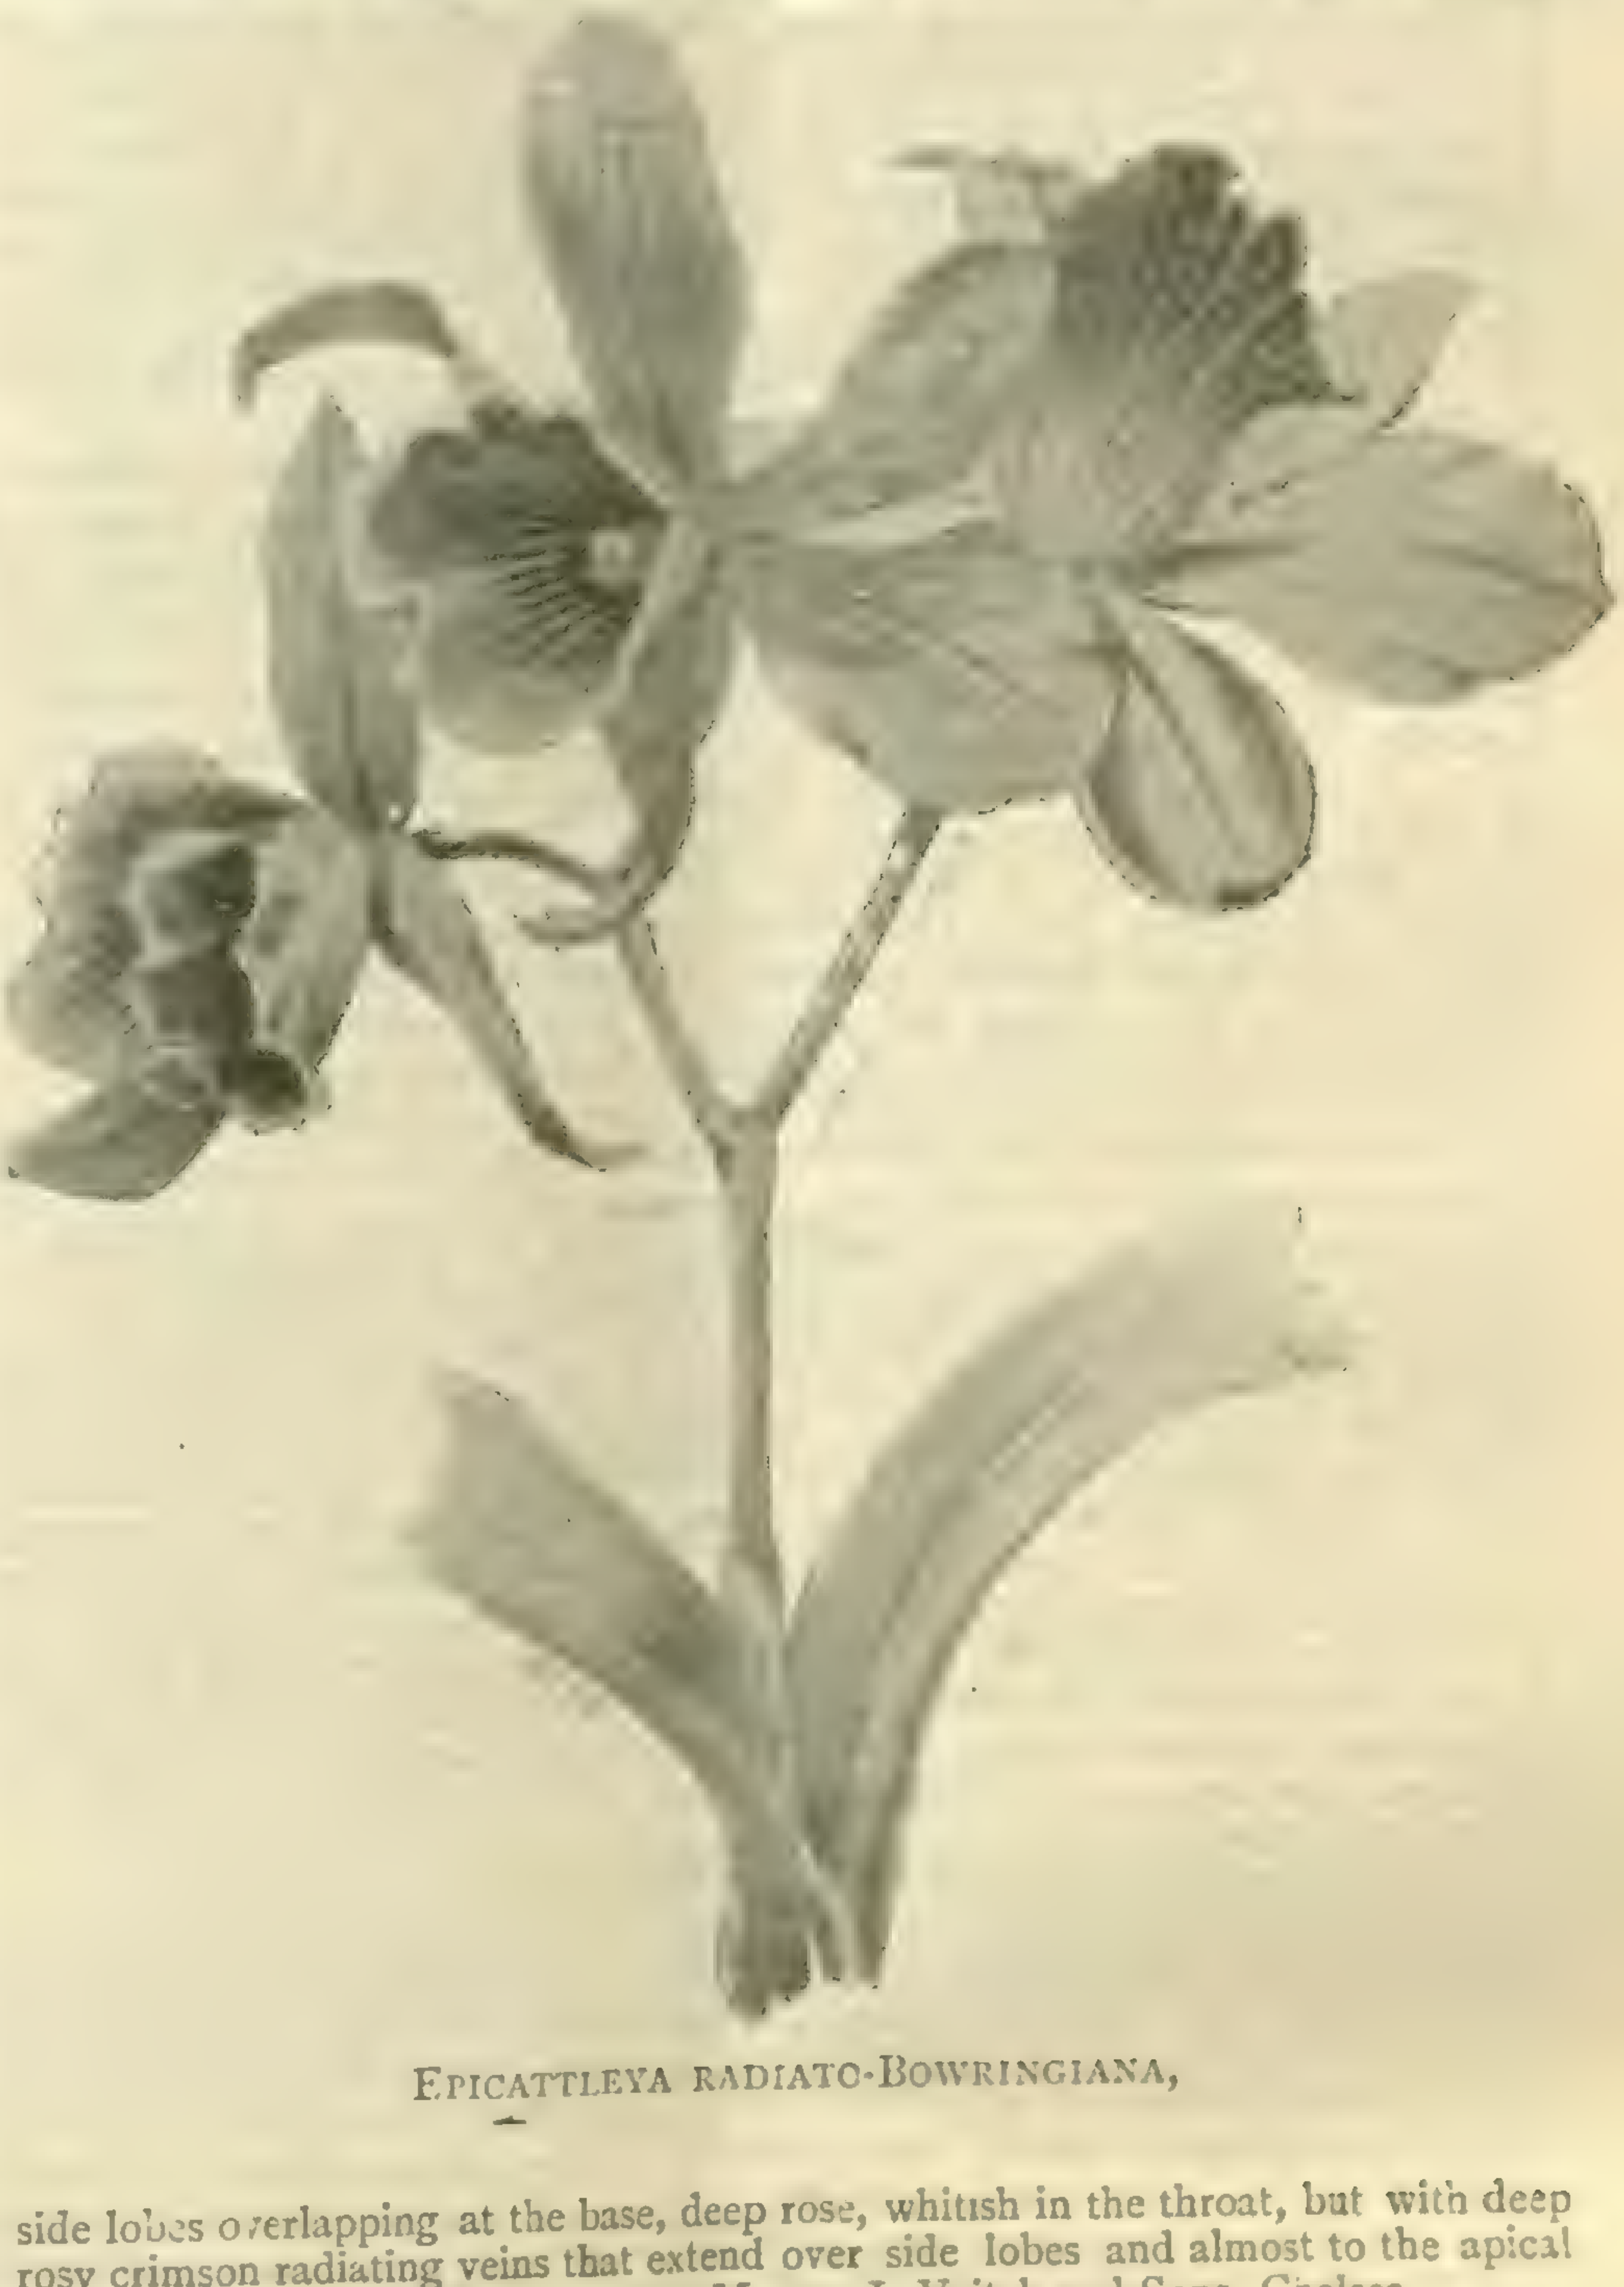
A MAGNIFICENT orchid with deep rose-purple sepals and petals and a broad spreading lip that is yellow at the base and intense crimson-purple at the apex. The sepals and petals are almost four inches long, and the latter are over two inches wide. The tube of the lip is creamy with veins of purple; inside, the yellow throat is stained at the base with dull purple. The broad apex is fully two inches across, and of the finest shade of rich purple, the margin slightly paler. This orchid is the result of crossing Cattleya Mendeli and Lælia purpurata. F.C.C., R.H.S., June 14. Messrs. J. Veitch and Sons.

ODONTOGLOSSUM CRISPUM PRINCE OF WALES.

The most beautiful and handsome form of O. crispum that has for a long time graced the R.H.S. tables. Its beauty does not consist in its spotting, but its purity. The sepals and petals are pure white, save for a faint tinge of rose in some of the sepals. The lip is extra large, white, with golden disk, and three or four rich red-brown spots where the disk ceases. Each flower is four inches and a quarter across, the segments being pointed at the apex, though very broad at base and centre; margins waved in all segments. A magnificent variety, with a spike carrying twelve flowers. F.C.C., R.H.S., June 14, and silver Banksian medal, Messrs. Hugh, Low, and Co., Bush Hill Park, Enfield.

EPICATTLEYA RADIATO-BOWRINGIANA.

This is a novel and interesting hybrid obtained by crossing Epidendrum radiatum with Cattleya Bowringiana. It has dwarf growths, with slender pseudobulbs, surmounted by two or three linear leaves about six inches long. Two flowers were borne on the spike. Each bloom is an inch and a-half across; sepals narrow; lateral ones, curved outwards, and then downwards; deep rose with veins of a darker tint; petals just over half an inch wide and an inch long, elliptic, coloured as in the sepals, but with the veining less marked. Lip an inch long; side lobes overlapping at the base, deep rose, whitish in the throat, but with deep rosy crimson radiating veins that extend over side lobes and almost to the apical margin. A.M., R.H.S., June 14. Messrs. J. Veitch and Sons, Chelsea.



EPICATTLEYA RADIATO-BOWRINGIANA,

LÆLIO-CATTLEYA DUKE OF YORK.

A distinct and strong-growing hybrid, with very deep rosy-purple sepals and petals, the latter fairly broad and standing out boldly. Lips very distinctly trilobate, the side lobes pale rose but deeper at the tips; front lobe spreading, trilobate, intense purple with crimson veins. The lip is fiddle shaped, owing to the contraction between side lobes and apex. This hybrid was raised by crossing a fine Lælia elegans with Cattleya Brymeriana. F.C.C., R.H.S., June 14, Messrs. F. Sander and Co., St. Albans.

MIKANIA SANDERI.

A tall-growing stove foliage plant, having slender purple stems and opposite leaves in pairs; the latter are six to eight inches long by four or five inches broad, ovate, bright green down the centre and deep bronzy or purplish-green towards the margins; the pale green or whitish veins run in all directions, and make the foliage very pretty. F.C.C., R.H.S., June 14. Messrs. F. Sander and Co.

CALOCHORTUS PURDYI.

A most interesting species, with white flowers that are covered on the inner surface of the segments with silky hairs, a quarter of an inch long. These are white, except at the base of the segments, where they are of a deep claret-purple colour. There are also claret-purple stains at the base of the flower, including a crescent-shaped blotch of this colour. The plant grows about ten inches high, and carries long linear, bright green, and burnished leafage. Each growth is branched, and carries an aggregate of six to twelve flowers. F.C.C. R.H.S., June 14. Messrs. R. Wallace and Co., Colchester.

ROYAL HORTICULTURAL SOCIETY,

June 14.

NOTWITHSTANDING the March-like coldness of the weather and heavy, leaden skies that seemed more suited to December or January than June, there was a first-rate show at the Drill Hall on the above date. Orchids, hardy flowers, and carnations, were the leading subjects, fruit and vegetables being a very small display. There was a large attendance, and, we believe that a very large number of new fellows joined on this occasion.

FLORAL COMMITTEE.

Hardy plants and flowers were freely exhibited and occupied by far the largest space in the hall.

Mr. J. F. McLeod, gardener to J. P. Morgan, Esq., Dover House, Roehampton, was the largest exhibitor of the day, and his splendid display down the centre of the hall was greatly admired; it consisted of a large number of grandly grown specimens of Souvenir de la Malmaison carnations, each of these carrying about thirty to thirty-six flowers and buds apiece. Had the weather been a little brighter of late the expanded flowers would have been more numerous, but as it was they were plentiful, large and substantial. Around these monuments of horticultural skill were arranged smaller plants, all in the pink of health and representing the several seedling forms of Malmaison carnations that have of late been raised. The whole exhibit was bedded in maidenhair fern, edged with Caladium argyrites, and with a few palms down the the centre. We congratulate Mr. McLeod upon his fine exhibit and upon its arrangement.

Messrs. Kelway and Sons, Langport, were extensive exhibitors, showing a grand lot of pæonies, pyrethrums, and delphiniums; among the latter, the varieties Beatrice Kelway, blue and white; Albert Edward, violet blue; Amyas Leigh, pale blue; True Blue, very deep; and Clovelly, soft lavender; were specially good in colour, flower, and spike. Extremely beautiful was the exhibit of Messrs. Wallace and Co., Colchester; it consisted very largely of irises, both the germanica forms and the Spanish varieties. Among the former there were baskets of Victorine, white and purple; Sanspareil, yellow and red and white; Chelles, yellow and ruby; and Mr. Newell, blue, all very fine. Among the Spanish iris we liked Chrysolora, yellow; Belle Chinoise, golden; British Queen, white and yellow; Potigier, blue and yellow; Reconnaissance, brown and gold; and Emperor of the West, blue and yellow. Anthericums, ixias, calochorti in variety, brodias, ixiolirions, liliums, and hemerocallis made up a most interesting display. Mr. Wallace had a number of flowering plants of the new beautiful Lilium rubellum.

Baskets and boxes of splendid trusses of rhododendrons were shown by Messrs. W. Paul and Son, Waltham Cross, and these made an effective display; a crimson-rose variety, named Joseph Whitworth, was especially noteworthy; this firm also showed a lot of bunches of garden roses, showing rugosa forms in good condition, and also a display of the double white and Scotch rose; hybrid sweet briars added fragrance to beauty, and proved a great attraction to the ladies. A goodly display from Messrs. H. Cannell and Sons, Swanley, Kent, included a collection of aquilegias in handsome bunches, both double and single forms of the highest beauty and elegance being displayed. Tuberous begonias were finely shown, the flowers being full and bright, and the plants in first-rate condition. Marquise de Travers, pink; Lord Sherborne, crimson scarlet; Lady Lindsay, yellow; Lady Naylor Leyland, carmine; Rosebud, rose pink; and Miss M. Griffith, white, were among the best forms in a splendid collection. Mr. Norman, gardener to the Marquis of Salisbury, Hatfield House, showed a basketfull of splendid spikes of the yellow Mrs. Audry Campbell, and the scarlet King Arthur carnations; the spikes were staked, and the bases fixed in damp moss, so a grand sheaf of blooms was the result. Mr. H. B. May sent a good collection of ferns, showing well-grown specimens of pteris, gymnogrammas, aspleniums, adiantums, and nephrolepis; Gymnogramma grandiceps superba, and G. Mayi were fine, as was Phlebodium Mayi. This group consisted of sixty varieties of ferns, each one raised by Mr. H. B. May, Edmonton, and on that score alone it was highly interesting. Mr. May also showed a fine rose-pink zonal pelargonium, Millfield Rival; a dwarf marguerite, and a golden tropæolum, named Sunlight. Messrs. Collins Brothers, Waterloo Road, and Hampton, showed sheaves of the more popular hardy herbaceous flowers, arranging these effectively; a bright rose single pyrethrum, named Monarch, was very attractive in the centre of this display. Cannas in great variety were staged freely by Messrs. Paul and Son, Cheshunt; the plants were all dwarf, and carried spikes of the most brilliant flowers. Incarvillea Delavayi, two good spikes, was an attractive item among rhododendrons, geums, pyrethrums, poppies, irises, and the graceful loose-racemed Laburnum Alkekengi.

A bold group of hardy flowers from Messrs. J. Veitch and Sons, Chelsea, consisted largely of a fine collection of irises, these being represented by baskets of a variety; Walneri, Fairy Queen, Bergi, Arnoldi, Virginica, Abou Hassan, Bridesmaid, Pallida, and Mrs. H. Darwin were among the best. Pyrethrums, Heuchera sanguinea, an exceptionally fine coloured form; Eremurus robustus, and E. himalaicus were all splendidly represented. Hardy flowers in great variety were shown by Mr. J. Russell, Richmond: irises, pyrethrums, Muscari comosum monstrosum, and Hemerocallis flava being exceptionally good. Messrs. Barr and Sons' contribution was a large one, and consisted of an immense variety of hardy flowers; there was a choice collection of ixias, hemerocallis, pyrethrums, pæonies, Spanish irises, German irises, and other choice subjects. Limits of space prevent us detailing the varieties of iris, but the Messrs. Barr had all the leading kinds and many choice forms not commonly seen, and representing the several sections. Carnation Primrose Queen, a broad petalled variety of primrose hue, was shown in fine condition by Mr. F. Perkins, Leamington. The big group of cannas staged by Mr. H. Cannell and Sons, Swanley, was the most gorgeous exhibit in the show; the plants were splendidly grown in small pots, and each carried a massive spike of brilliant blooms; Aurea, Konigen Charlotte, Ami J. Chretien, Conquerant, Duchess of York, Milne Redhead, Explorateur Campbell, Alex, and Billard were a few of the most impressive varieties in a collection where all were of the greatest value.

Messrs. F. Miller and Co., Fulham Road, S.W., exhibited a good strain of single petunias, and a famous lot of mignonette—Miller's Civic—beautifully grown and flowered. Messrs. J. Veitch and Sons, Chelsea, put up a basket of the lovely Hydrangea hortensis mandschurica, carrying massive blue-tinted heads; Cornus Kousa, Hybiscus syriacus cælestis, Fraxinus Mariesi, a prettily-flowered tree; and Hydrangea japonica Mariesi, a form with huge bluish bracts. Messrs. J. Cheal and Sons, Crawley, made an exhibit of cut spikes and trusses of rhododendrons, Weigela amabilis alba, Cytisus Andreanus, Spiræa Van Houttei, Colutea crocea, Xanthocerus sorbifolia, &c., staging these with sprays of golden and purple foliage of oak and elm and birch. Messrs. F. Sander and Co., St. Albans, arranged a group of their new and attractive Acalypha Sanderi with a profusion of crimson inflorescences, and also a quantity of the variegated D. Godseffianum; a few thunias and sobralias brightened the exhibit considerably. Globba calophylla with queer yellow flowers; and Mikania Sanderi with cissus-like foliage, green and purple green in colour were new plants staged by this firm.

ORCHID COMMITTEE.

There was a choice display before this body, and a fairly extensive one also. From Chelsea Messrs. J. Veitch and Sons sent several freely-flowered examples of Lælio-cattleya Canhamiana, Cattleya Mossiæ Reineckiana, L.-c. Hippolyta, Epidendrum radicante-vitellinum, Trichopilia suavis alba, very [illegible] Epiphronitis Veitchi, Disa Langleyensis, and D. Veitchi. Mr. W. H. White, grower to Sir Trevor Lawrence, Bart., showed a collection of rare and interesting orchids, these including Cœlogyne Schilleriana, a dwarf, green-flowered species, Geodorum Augusti, Bulbophyllum Lobbi Burford var., Odontoglossum crispum, pure white; O. elegantius Baroness Schröder, Dendrobium Parishi polyphlebium, and a grandly-flowered D. Bensoniæ, with about forty flowers on one stout pseudo-bulb. Messrs. J. McBean and Sons, Cooksbridge, Sussex, showed Odontoglossum crispum in considerable variety; some of the rose-tinted forms were very pretty, while one large flower with red-brown spots attracted considerable attention. Mr. H. Wiffen, gardener to J. Bradshaw, Esq., The Grange, Southgate, staged a nice but small collection. His choicest specimens were Lælio-cattleya Aphrodite, L.-c. Arnoldi, very fine; Lælia grandis tenebrosa with four splendid flowers; Cattleya Mossiæ Reineckiana, C. Wagneri, several good forms of Odontoglossum crispum and O. maculatum, and also a rosy-lipped C. Mossiæ, named Admiral Bradshaw.

Mr. W. H. Young, orchid grower to Sir Frederick Wigan, Clare Lawn, East Sheen, showed a seven-flowered specimen of the somewhat rare Scuticaria Hadweni, Lælio-cattleya Canhamiana var. Iolanthe, a superb broad lipped form; the lovely Lælio-cattleya Lady Wigan, Cattleya Mossiæ Maxima, L.-c. Arnoldiana, Lælia grandis tenebrosa, Cymbidium tigrinum, Lælio-cattleya [illegible] elegans, and Miltonia vexillaria var. Constance Wigan, with a fine white lip. Messrs. Stanley-Mobbs and Ashton (late W. L. Lewis and Co.) put up a very handsome group of orchids, showing a considerable number of fine forms of Cattleya Mossiæ, one named Madonna and having purest white sepals and petals and very light lip, being of especial merit; C. M. Aurea, C. M. Sir Thos. Lipton, also a white form with yellow marked lip, were also attractive. Lælia purpurata, Oncidium crispum, Lælia tenebrosa, Cypripedium Evenor Southgate var., C. Rothschildeanum, C. Gertrude Hollington Southgate var., very fine; C. Sir Thos. Lipton (C. bellatulum album crossed C. ciliolare), whitish with black spots; and C. Donald Ross in the way of C. Lowianum were on view, as also was the "blue" Dendrobium Victoria Regina.

Mr. James Hudson, gardener to Leopold de Rothschild, Esq., Gunnersbury House, Acton, showed a large specimen Lælia purpurata, that carried ten good spikes, each with three or four flowers; this specimen was remarkable for the fact that it has been in cultivation for thirty-seven years, and under Mr. Hudson's care for only three years less than that period. Mr. H. J. Chapman, gardener to R. I. Measures, Esq., Camberwell, sent a very light form of Lælia purpurata named L. p. Ernesti. Messrs. Linden and Co., Brussels, sent Eulophia congoensis, with large rosy flowers. The Messrs. Veitch, Chelsea, sent Lælio-cattleya Hippolyta aurantiaca, a rich orange colour, and one of the very brightest of orchids; they also sent L.-c. Canhamiana superba, a glorified form of a now well-known hybrid; L.-c. Eudora splendens, Cattleya Gertrude (C. Mossiæ crossed C. superba), and other choice novelties. Mr. S. Cooke, gardener to De B. Crawshay, Esq., Sevenoaks, staged a pretty form of Cattleya Mossiæ named Sprite, and a good L. purpurata. Messrs. H. Low and Co., Clapton, exhibited a grand plant of a magnificent form of Odontoglossum crispum, the spike carrying twelve grand flowers of large size, sepals and petals almost absolutely white, and the tip having three or four red-brown spots on it just below the yellow disk; this form was worthily named Prince of Wales. McBean's variety of O. crispum, with huge red-brown blotches, was very attractive. Messrs. Linden and Co., Brussels, sent O. crispum Dallemagnæ, O. c. Morning Star, and O. c. Le Czar, this having white petals and rose-tinted sepals, the latter having large red blotches.

Mr. H. Druce, Regent's Park, showed four cypripedium of the bellatulum group, C. b. Druceanum, C. Mrs. H. Druce (C. niveum crossed C. bellatulum), C. Walkerianum (C. concolor crossed C. bellatulum), and another form of the latter cross; one had a big flower, white with black spots, and the other a small yellowish flower with tiny dots of blackish purple.

FRUIT AND VEGETABLE COMMITTEE.

Very few exhibits came before this body, the largest being two boxes of new cucumbers shown by Mr. S. Mortimer, Rowledge, Farnham; one is named [illegible] Keeper, and the other Sensation, and both have Telegraph as one [illegible] were excellent cucumbers, tailless and free fruiting. Mr. E. Beckett, Aldenham House Gardens, Elstree, showed the Carter spinach, and gained a cultural commendation.

Mr. J. Prouse, Hallbound Gardens, Beaconsfield, Bucks, showed [illegible] cabbage, a fine early and quick-hearting variety of high quality. Mr. J. Hudson, gardener to Leopold de Rothschild, Esq., Gunnersbury House, Acton, exhibited sixteen fine fruits of Lord Napier nectarine, and two punnets of Guigne [illegible] cherries; cultural commendation.

MEDALS.

Silver-gilt Flora medals to Mr. J. F. McLeod, gardener to J. P. Morgan, Esq., Roehampton; and to Messrs. H. Cannell and Sons, Swanley. [illegible] *Banksian* medal to Messrs. Barr and Son, Covent Garden. *Silver* [illegible] to Messrs. Kelway and Son, Langport; Mr. H. B. May, Edmonton; Messrs. J. Veitch and Sons, Chelsea, for hardy flowers, and one for orchids; Messrs. Stanley-Mobbs and Ashton, Southgate. *Silver Banksian* medals to Mr. J. Hudson, gardener to Leopold de Rothschild, Esq., Gunnersbury House, Acton; Messrs. H. Low and Co., Clapton, for Odontoglossum crispum Prince of Wales; Messrs. Wm. Paul and Son, Waltham Cross; Messrs. R. Wallace and Co., Colchester; and Mr. Norman, gardener to the Marquis of Salisbury, Hatfield.

Smilax.—We see in the great demand that exists for this [illegible] plant how much its twining growths are valued for domestic decoration, [illegible] gardener feels it to be his duty to grow a few pots of it; but to see it [illegible] quantity, it is needful to look into one of our market establishments, where [illegible] of it are found by hundreds, and a constant succession is furnished. I was [illegible] day or two since looking through Messrs. Hawkins and [illegible] Twickenham, where smilax is now largely grown. Still with them it [illegible] only some two years. The plants are raised from seed [illegible] are finally put into nine-inch pots. These are stood pretty [illegible] rows across a centre bed, wires are lightly strained across each row [illegible] over the pots, and others four feet above, and small string runs from [illegible] These strings are filled with pretty climbing growths in about three [illegible] then cut, and others take their places. Prices are low, but the [illegible] considerable.

LEAVES FROM A RAMBLER'S NOTE-BOOK.

ALONG KENTISH HIGHWAYS.

No good gardener ever considers that his education is complete. He may always learn something, or see fresh ways that may be improvements on his own, and the fully-taught self-satisfied individual who flatters himself with the vain supposition that he knows all that is worth learning is generally the first to succumb when put to a practical test. But how do we learn after we have passed from the hands of those who are supposed to be teachers and have become teachers ourselves? By many ways; as, for instance, the interchange of opinions among practical men, who, perhaps, may not altogether agree, but after adding and drawing deductions there lies between two extremes a middle course, and that course, possessing elements of both arguments, is generally a fairly reliable one. Doctors disagree, and so do gardeners (even in these columns!) and those who read the MAGAZINE get the benefit of their differences. Thus, then, is reading a means of education to those who know the rudiments off by heart. One practical man steps forth and advances his opinions; another comes along and differs from him, and while the two dogs are, so to speak, fighting over their bone, another comes along and runs away with it. That third is the diligent reader who sifts the arguments on both sides, takes the best out of them, and puts it into practice. He is generally the one most benefited.

Observation is another means of education open to all, but not always taken advantage of. "Keep your eyes open, lad, and miss nothing worth looking at," was the advice given to the writer by a good old gardener who had proved the wisdom of it. One man sees effects and is satisfied, but he has learnt nothing. Another looks on effects, and straightway hunts for the cause. He may not find it till after a diligent search, but having obtained it he has got the whole thing, for one is of little use without the other. And where can we learn from observation? Everywhere, for things appertaining to gardening meet us no matter where we go, the only thing necessary being a gardener's eye to look at them. The occupation is moreover interesting, and what is more enjoyable than a walk round a garden under the care of a brother craftsman? Though interesting and instructive, such walks are, as a rule, like many excellent articles which appear in these columns—purely practical. Human nature, however, demands variety and diversion, which helps us to tackle with new spirit more serious matters. In reading, this diversion is obtained in the perusal of that which breaks away a little from the stern unbending practical side of gardening, and in the case of the writer, diversion was sought and found in a long ramble along Kentish highways.

A man need not necessarily be romantic to be carried away by the beauty of a spring morning, for indeed he would be soulless if he loved it not. There is no spasmodic bursting of a tree here, or the opening of a solitary flower there, but all Nature has received her call and is responding to it with one accord. The movement is so general and even that we hardly notice it. Copse that yesterday was bare branches, has to-day a tinge of green, and to-morrow will be a mantle of emerald. Such is the transformation scene, and who is he that can see and move about among it without feeling the effects of Nature's awakening? But what is there along a highway to interest a gardener? you ask. Everything, I say, for Kent is little else but a garden, with its orchards and plantations, its hop fields and market gardens. Home life itself [illegible] horticulture, for there is scarcely a homestead without its garden, or a village without its gardening society, and even the farmers have so much interest wrapped up in matters coming under the category of horticulture, that to be successful they require more than ordinary horticultural skill. Thus, then, the county is a land of gardens and gardening.

In the spring everyone talks of prospects, wonders what fruit will be like, and how hops will turn out, and whether prices will be good. Judging from present appearances the outlook could not well be better, and the picture of acre after acre of snowy blossoms is one such as can only be seen in Nature. First the plums and pears, then the apples and cherries, all aglow with beauty, all after-results and the state of the grower's finances depending largely on these few weeks of blossoming time. As we go along, the chief thing noticeable is the number of fresh plantations, for fruit culture is markedly on the increase. Here is an orchard perhaps ten acres in extent, with trees planted in lines like the [illegible] on a chess-board. Every one is of the same character and every stem is whitened with lime-wash to the spread of the branches, to destroy insect pests and obnoxious growth. Round each tree the grass looks greener than elsewhere, as a coating of good manure or artificial fertiliser has been applied to assist growth and fruit production. A peep into the branches shows them to be thinly dispersed and the heads open to admit air and sunlight. That is the kind of orchard that, barring accidents, will pay the rent and leave a balance in favour of the grower. Some trees are a sheet of bloom and others are bursting, but all healthy and clean. We know nothing of the grower except that his work proves that he knows his business and it is such as he that continues planting.

A shrewd hard-headed fellow is the Kentish fruit grower. He is somewhat reticent, and is apt to question the advice of any expert, but he puts it into practice all the same, and if he proves it to be sound is ready to swear by it. As we go along we pass another recently formed plantation. The position is somewhat exposed, and a row of damsons [illegible] along the unprotected side. They are to act as a shelter—and a profitable one—to the fruit of more tender nature inside. The [illegible] have been well thought out, as at present the plantation is a hop garden. Probably the grower fancies he can see more in fruit, for the young trees are dispersed between the rows of hops. The latter will remain till the fruit trees are established. Then they will be removed, the ground laid down to grass, a permanent orchard is the result, and during the process the land has been returning something. The field is a gentle slope, and on the lower side we notice the trees have been planted on the surface and the soil spread over the roots in the form of a mound. Further examination proves the soil to be of a wet and clayey nature. The grower evidently knows the resulting evils of planting in such a medium and averts it in the above manner. The trees are gardeners' trees—clean, sturdy, and healthy. They must have cost considerable, and the grower might have got others at half the price, but his work throughout proves him to be a practical man who knows that a cheap fruit tree is often the dearest in the end.

Hops may not be generally interesting to gardeners, but in Kent they are of extreme importance. They are a precarious crop, paying much or little as the case may be, and farmers look back with envy on the golden days of hop-growing, before beer was brewed by the aid of other ingredients besides malt and hops. No garden crop demands better culture or more constant attention. The hop grower must wage a continual warfare against insect and fungoid foes; he must not stint manure or labour, or think too much of the outlay he has to make before he may hope for any return. If he did probably he would not do it, and the result would be failure. The good season of last year has buoyed up many with hopes, and as we look over the hedges on either side we see that digging for the most part is completed, and the big stacks of poles are gradually disappearing to take their places one after the other along the rows. On many farms permanent poles and wire are used, and though the outlay is heavy the job is more permanent. Hop gardens always demand attention. There is the digging, poling, tying, manuring, washing, picking, and drying, all following each other in succession. Of all persons taking part in these operations the dryer is the most important. The work requires experience and skill, and though the man who performs it may take part in all previous operations, he is only a commonplace individual like those around him. When, however, the hop-oast is again brought into use he develops into an important person, and, soaring above ordinary occupations, becomes a dryer on whom much depends. He enjoys this significance so long as hopping lasts, working hard and feeling the importance of his office. Hopping over, he is no longer a dryer, for his occupation has gone, and for another year he takes his rank as a labourer. Hops are always requiring attention, and now signs everywhere tell us that the demand is poles and strings for the quickly growing bine.

From hop districts we again come to fruit, this time gooseberries, currants, and so forth. The bare skeletons of the closely pruned red currants (for Kentish growers always prune closely) are rapidly assuming a green mantle as I write, and early signs of fruit are abundant. The good farmer has all his plantations dug and manured during the winter and early spring, but ever and again we come across the plantation of the inevitable careless man, where the signs are—no digging, no pruning, overgrown crowded bushes, profusion of weeds, and a general air of untidiness. Result—little fruit, poor quality, and a constant grumble about bad times. Gooseberries are no longer bushes of bare branches, but masses of fresh-looking verdant foliage, and early signs of good crops. But there are many things to contend with yet. Frost may come, and the time has not yet arrived for the appearance of the hungry caterpillar and the still more deadly gooseberry mite. Black currants are a favoured Kentish crop, though somewhat uncertain. Last year in many districts they were a failure, but where such was not the case prices ruled high. Bushes generally are starting well, but occasionally we come across plantations where the dreaded mite is in possession. Desolation reigns here, as the farmer has no efficient means of fighting the microscopic foe. From the serious aspects of commercial gardening we note gardening for pleasure in the numerous charming homesteads that skirt the highway as we pass along. Through the breaks in the trees we see that which assists greatly in making English home-life enviable—the garden. Inclination tempts us to enter and explore the interior of the domains, but our business lies along the road, at every bend of which we enter on a fresh landscape, full of features of renewed interest, but everywhere and on everything there is the sign of resurrection to new life, as all Nature answers to the call of spring. Who will say that such a ramble is not only interesting but instructive?

H.

Early-flowering Violas.—Although there have been introduced into commerce so many varieties of violas that they may be counted by hundreds, yet there are lacking some distinctly early-blooming varieties. I do not mean those which flower early in frames—I rather refer to plants that, planted out in the autumn in beds to form carpets for tulips, hyacinths, or daffodils, yet do not show a bloom until the bulbs are over, and just become gay when the usual summer bedding is arranged. There are so many that do well as summer bedders, or satisfy the requirements of exhibitors, that raisers may well turn their attention to the production of very early varieties, such as will bloom in March or April, with the primroses, polyanthuses, arabis, aubrietias, double daisies, and similar hardy plants. To test earliness thoroughly, planting should be done in October, and the clumps should be fairly strong ones. Looking over the very extensive collection of violas planted at Chiswick very recently, I found very few showing flowers. Probably a general bloom will not be found until the end of May. The plants have all been put out this spring, so they should do well and stand as they are through next winter; then they would have excellent opportunity to show their natural early, or otherwise, flowering qualities. In spring bedding, two pansies stand out markedly as early, and they are both old—Blue King, the very best yet seen of its colour for earliness, and Cliveden Purple. We want violas that bloom with these; indeed, even earlier if possible. Perhaps in very warm positions some may bloom early, but generally such is not the case. The plants are so hardy, and so beautiful when in full bloom, that they merit all attention to render them more useful in early spring gardening.—A. D.

CHRYSANTHEMUMS.

SUMMER MANAGEMENT.

As soon as the work of potting is completed the plants may be set out in their summer quarters. A position should be chosen where the full influence of the sun may reach the plants from early morning till the close of the day, because it is very essential to the production of good flowers that the growth be well matured. Any position near large trees, or overshadowing buildings should be avoided so far as they interfere with the sunlight, but at a reasonable distance these offer a considerable advantage as a shelter from strong and cold winds. Most frequently the plants are placed in rows by the sides of garden paths during summer, an arrangement that is very convenient for small collections, but where several rows are arranged together, it is important to set out the rows running from north to south, and leave between these a space of four feet or more, with about two feet from plant to plant, in order to give abundant room for development. Boards or pieces of slate under the pots are necessary to prevent worms entering through the drainage, and also to prevent the plants ultimately rooting through into the ground, and so encouraging a late, and probably too vigorous growth, besides which the check resulting from the inevitable loss of such roots when the plants are removed inside, would be more or less serious in its effect on the opening blooms.

Some years ago we tried the experiment of planting out some Japanese varieties and several Queens along the front of a greenhouse outside. The border was specially prepared with soil as for potting and the plants set out at the end of May. During summer their growth was carefully attended, three shoots were left to each plant and at the end of September the growths were drawn inside the front ventilators and suspended from the roof, the outside portion of the stems being protected and the necessary opening left to admit the stems, also covered, as far as possible, with mats. The resulting blooms were very disappointing, for although the growth was free, and apparently satisfactory, not one of the flowers were up to exhibition form. The lesson we gained from this was that unlimited root room is the adverse of advantageous in the cultivation of large flowers. Possibly an extended trial might have led to more satisfactory results, but we found nothing more encouraging than the saving of labour in watering to warrant further experiment. Extreme caution must be exercised in watering, as it is somewhat difficult to determine, at the present stage, the exact condition of the roots. When the new soil gets fairly well occupied by roots, of course it is a very simple matter, but just after potting the ball of roots naturally dries more quickly than the surrounding new soil, so that there is more need for sound judgment, based on the usual requirements of particular varieties. Such, for instance, as Etoile de Lyon, require considerably more water than the less vigorous and more shy rooting variety, Mdlle. A. de Galbert. Showery weather is apt to mislead us in giving water, by keeping the surface soil moist while the lower portion may become quite dry; hence, in growing plants in pots, the oft-repeated advice against watering in driblets is sound, because there is no appreciable reserve of moisture available for the roots through capillary attraction, as in the case of plants in the open garden; and we must especially guard against the chances of the lower roots suffering from want of moisture.

In this garden we are invariably troubled with thrips, and constant syringings are a great help in keeping these pests at bay. During very hot weather the plants are well wetted over two or three times a day, and the surrounding paths also well moistened. If, owing to dull weather, the damping is discontinued, to prevent as far as possible the encouragement of soft growth, we find the use of the contrivance known as Stone's Pneumatic Spray Diffuser the most convenient and economical method of directing a spray of insecticide into the centre of the growing points; this is more effectual than tobacco powder, because it penetrates more thoroughly, though for aphides the tobacco powder is a very satisfactory agent in keeping the growths clean. Growths will be rapid from now onward, and all such details as staking and tying of shoots will urge their own need, and little beyond this, and the daily routine of watering and syringing will claim attention for some time yet.

The unfortunate disposition to form flower buds instead of growing after the first break is formed appears likely to be troublesome in one or two of this year's new varieties. President Nonin and Lady Isabel are with us as bad as Viviand Morel, and Mdlle. Lucie Faure is likely to prove so. This latter, by the way, will probably be as often shown in classes for Japanese as for incurved, at least outside the influence of the N.C.S. rules. I saw beautiful flowers of distinctly Japanese character from early buds last season, and though on late buds it may prove a very suitable companion for incurved varieties, I am not quite satisfied that this is the most desirable section with which to class it.

A very gratifying feature of several prize lists for the coming season is the increased encouragement offered for displays of cut blooms exhibited in vases with their own foliage instead of the usual method of showing them on sloping stands, denuded of all their leaves and, consequently, of a considerable share of their natural beauties. There can be no question as to which is the best manner of staging the flowers. Blooms cut with long stems and set up nicely in vases with ample foliage present by far the most attractive picture from any point of view. To ensure the flowers keeping fresh and bright over as long a period as possible, and most especially in the often over-heated atmosphere of an exhibition hall, it is better to strip off the foliage from the stem carrying the bloom and tie on a separate stem with leaves. How unnatural and cruel a practice the showing of flowers on bare boards without any of their own natural greenery is, is quite as apparent to those who have to submit to the rules governing competitions as to those who take an outside view, and yet how slowly we relinquish old customs. The Scottish Horticultural Society has done very much to encourage the exhibiting of blooms in vases, and last season were rewarded with exceptional displays in several classes, these forming by far the most attractive features of the cut flower section of the exhibition. One of the most flourishing suburban societies is the Putney and Wandsworth, and I note liberal encouragement is here offered in the right direction. The society has the advantage of Mr. McLeod's services as hon. secretary, which ensures, with the help of a strong committee, a large measure of success.

Trent Park Gardens.

W. H. LEES.

THE STRAWBERRY CROP.

THOUGH full early to talk of the quantity or quality of this crop a few words as to protection and lengthening the season as long as possible may not be out of place. Our earliest fruits this season are on Royal Sovereign, and this variety is very heavily cropped, so will well repay extra attention for the production of fruit as early as possible. By a little additional care we may make the best of what is anything but favourable weather. Plants having a great weight of fruit to support may with advantage be given supports, and I find it a good plan to place tiles or slates under the fruits to promote early ripening. Many will be unable to afford the aids advised, but other means may be employed, and I have found it an excellent plan to place small bushy sticks under the trusses, and if lifted from the soil or protecting material as advised the ripening period will be much earlier, as no matter how well mulched it is a difficult matter in a dripping season to protect the best fruit from slugs, and if they can be kept dry by being lifted there will be a great saving. The placing of twigs is not a tedious work, as if the trusses are held in one hand and the other used for placing the wood a lot of plants may be done in a short time; I do not mean forked sticks, one to each truss, but short, bushy material, to support the weight of fruit. When in country districts I have used all kinds of wood if sufficiently bushy and stout. There are wire supports, but so far I am not much impressed with them, as they are not at all pliable or easily adjusted. In heavy clay soil supports of some kind are needed for large fruits in a wet season to prevent losses. Ordinary mulching will suffice for sorts not used for dessert, and cases, if used liberally, should be placed as lightly as possible over the roots, as heavy rains cause the fruits to lay close to the material, and so it is worth while replacing straw or giving the best position to the finest fruits. Much may be done to further the ripening or removal of useless foliage; indeed, in a wet season I have found it advantageous to cut away a little of the gross leafage, and this admits the light and air so necessary for ripening. Many growers would not agree to the removal of foliage at this season, but so much depends upon the variety, whether closely planted or not, and the weather. Such kinds as have a long stalk will not need this treatment, but these are the sorts that benefit by being raised from the soil or mulch to promote early ripening.

Another point often lost sight of in gardens is prolonging the season as much as possible, and in our own case we endeavour to have the fruit as late as we can. Some of the latest are not the best flavoured, and last year our latest strawberry was Eleanor, only a second rate variety, but where there is a demand for late fruits one cannot always study variety. I wish Laxton's Latest of All was a little later here, for it is a specially good fruit, with a distinct indication of Queen flavour, and a firm fruit not readily affected by rains; though not a gross grower, it is a most prolific variety for its size and quality. Those who can plant the latest varieties on a north border will find these plants invaluable, as they will give fruits when those in the open are past; such are not yet in flower, owing to the late season, so that they will be a welcome addition to the fruit supply in a few weeks' time. I always leave the mulching of these late kinds as long as possible, as I think it retards the bloom. To hasten a few plants on early borders when in the north, I always placed a few spare sash lights over plants growing at the foot of a south wall or in front of vineries, these were placed on inverted ten-inch flower pots, and, given shelter, gave us fruit at least ten days before those in the open came in, and in a wet season the fruits thus protected were of high quality. I have found Royal Sovereign excellent if given protection in this way, and previous to the last-named variety appearing, Noble was our earliest fruiter, but the good quality of the newer variety has ousted Noble.

A word as to protection of the fruits when ripe. I am aware there is nothing new to relate, but I would point out the advantages of netting, so that any one may gather the fruit without moving the nets; this is a great gain, and it can be done now with a great saving of time, as once in position it remains there till the fruits are cleared. Stakes six feet in height placed twelve feet apart will do well as supports if the nets are strained over them, and if light bamboo sticks are used as stretchers at the top so much the better, but lath or other supports to keep the nets in position will suffice.

G. WYTHE.

Warm versus Cold Water for Plants.—The question as to the relative value of warm and cold water for plants grown in a temperature equivalent to that of the ordinary plant stove has been discussed from time to time in America as in this country, and it is of interest to mention that experiments have been made at the Wisconsin Experiment Station to test the effects of water of different temperatures upon hothouse plants. The temperatures tried were 35, 50, 65, and 86 degrees F., the subjects being coleus and tomato plants. Water of the lowest temperature checked the growth of the coleus plants, but no appreciable difference was noticeable in the growth of the plants treated with water of the other three temperatures. Tomatos proved more susceptible to modifications of temperature. As in the case of the coleus plants, their growth was checked by the application of water at 35 degrees F., while they grew best when supplied with water warmed to 65 degrees. For example, twenty days after planting the growth made in millimetres (25 to the inch) was $101\frac{2}{3}$, after watering with water at 35 degrees, $136\frac{2}{3}$ after water at 50 degrees, 154 after water at 65 degrees, and $130\frac{1}{3}$ after water at 86 degrees. In other trials the results were proportionate, water at 65 degrees, having uniformly promoted the most vigorous growth.

LIQUID WEED DESTROYERS.

THE poisonous substances now so largely used for the destruction of moss and weeds upon gravel walks and carriage drives are the means of a considerable saving of labour in the keeping of these in order; while the improvement effected by the surfaces being undisturbed by knife or hoe enhances their appearance, and adds greatly to the pleasure experienced when using them. The present season of the year is generally selected for applying weed destroyers, and, providing the weather is fairly dry, it is the most suitable, for if the work is well carried out weeds will not appear for at least sixteen months afterwards, which will be the autumn of the following year, and as growth, if any, being very slow through the winter months, one application of the mixture in two years will, in most cases, he found sufficient. Settled weather should, if possible, be taken advantage of, and a few days after a heavy rain, while the soil is quite moist below, is preferable, by which means the liquid does not drain away so quickly, and is consequently more effective than when the under strata is very dry.

It is needless to mention the quantity of liquid to use with a given proportion of water, as this and the way to mix it is plainly set forth upon every cask, or package, when received from the manufacturers.

For using upon narrow walks where a tub upon wheels cannot be taken, I have found a paraffin cask very convenient, and easily moved from place to place, as the work proceeds, and as the cubical capacity of this is about forty gallons, the requisite quantity of poison to every cask of water is easily ascertained.

Where grass verges or lawns form the boundaries of the area to be operated upon the application of the liquid is very safely and easily accomplished, but where the edgings are of living plants, as box or others whose roots penetrate deeply, and spread beneath the walk, more care is required. With these the gravel should be drawn back to at least eight inches from the edging, removing with it any weeds, and leaving it in the form of a ridge. In using the liquid this ridge, as well as the rest of the walk, may be saturated, but the application must not be at greater speed than will allow of it sinking direct below the surface, thereby avoiding the risk of damage that would arise should it run very near the roots. In dressing walks with this description of edgings settled weather should be chosen, as a sudden heavy fall of rain shortly after its application would probably carry sufficient of the poison to the sides to cause serious mischief. Neither is it advisable to return the gravel to its place for a day or two after the dressing has been given. A small can, with a well-fitting rose that will emit the liquid in a nearly direct line should always be used alongside living edgings, of whatever form they may be, as stray drops falling upon a well-kept lawn or grass verge will cause very unsightly spots to exist for a long time. For the centres of carriage-drives and open spaces a large can and rose may be used, which will expedite the progress of the work considerably. To be effectual for a long period the entire surface must be evenly and thoroughly saturated, whether or not weeds are visible at the time, for if this is not done the latter will soon after appear upon the seemingly clean places, and so mar the appearance of the whole.

The weed-destroyers now prepared and sent out in a powdered form are very convenient for use where only small quantities are required, as they are easily mixed with water, and, so far as I have observed, are equally as destructive to vegetable life as the liquids, and costing less for carriage, and, there being no returning of empty packages, proves the article to be a cheap and convenient means of keeping gravel paths free from weeds. I have not found any kind of weed that could withstand, unharmed, a proper dressing of the weed-destroyer, for although some of the more tenacious of life will survive its effects longer than others, they all are forced to succumb in course of a few days after the application.

On this estate the necessary gravel for walks and drives is mostly obtained from the sea-shore, and this, though free of ordinary weeds, is apt to contain, more or less, a small growing variety of sedum which is scarcely visible at the time the gravel is removed, but it soon makes its presence known when spread upon the surface of the walks, and proves a most difficult subject to eradicate with hoe and rake, for however clean the surface may appear after the use of these in fine weather, it springs again quite fresh after rain. I have always considered this sedum the worst form of weed to deal with, and one that requires more than ordinary measures to destroy it, but a good dressing of the weed destroyer whenever the walks are regravelled clears it off completely, and no more is required until gravel is again wanted.

Galloway House, Garliestown, N.B. JAMES DAY.

Runner Beans.—I read, not long since, a recommendation by a gardening writer, to sow the old Scarlet Runner bean still, on the ground that it was the most prolific cropper. Those who know the cropping merits of newer and superior varieties would smile at such an assertion, but such advice given to the unlearned is misleading. All who have grown the new long-podded forms, such as Ne Plus Ultra, Prize Winner, Best of All, Exhibition, will recognise the remarkable cropping qualities of these beans, and, allied to length of pod produced, it is really not exaggerating to say that these newer varieties yield almost double the produce the older ones do, because the pods are naturally double as long; but, what is more, keep young, tender, and succulent so much longer after they have become of gathering use than do the shorter pods of old varieties. Our gain in the direction of the newer bean production during the last ten or twelve years has been remarkable, and we shall find it very difficult to get far beyond it. Then, the smooth-podded section, the climbing Canadian Wonder, Tender and True, is an exceedingly valuable addition to our runner stocks; and another most valuable addition to this section is Sutton's Excelsior, that will run, if allowed, to a great height, and produces a wonderful crop of pods. There are two or three others of this section, but these two are the best. When grown in good rows, they take the place largely of several sowings of ordinary dwarf beans, and thus contribute a saving of ground and labour. A sowing of the Golden Butter beans should be generally made to complete the collection, as this variety, where well grown and properly cooked, invariably furnishes dishes that are highly appreciated by all bean lovers.—A.D.

VEGETABLES FOR EXHIBITION.

SHALLOTS.

SHALLOTS (*Allium ascalonicum*) are pretty generally cultivated in this country, and, as a rule, with success. By many they are preferred to onions for pickling purposes, and, in my opinion, the preference is deserved. Their mode of culture is very simple, and, like onions, they may be cultivated for years on the same piece of ground if it is well tilled and manured each season. Any aspect except a northern one will suit them. The land should be well trenched and enriched with farmyard manure during autumn, and, early in the year, as soon as the weather will permit, the bulbs should be planted, in fact the earlier the better. I like, if possible, to plant early in February, as the frost never injures them. The ground should be pointed over with the fork and raked down neat and level. Plant in rows one foot apart and ten inches from plant to plant. On a light soil the bulbs may simply be pressed in with the hand, but not buried entirely, about three parts will suffice; but on stiff, heavy land it will be necessary to use the dibber, pressing the soil fairly firm about the sets. As a rule shallots lose no time in forming roots and commencing to grow, and by the end of June the crops should be matured and ready for lifting, and the ground ready for some other crop. Simply lift or pull up the bulbs, and lay them in an airy sunny place, when they should be turned about every other day, as it is essential to thoroughly ripen them before storing. Any cool, dry, airy room will keep them well, and on wet days they should be examined, cleaned, and sorted, and the smallest bulbs should be put on one side for the following year's crop.

Shallots may be produced from seed, but I have never been satisfied with this mode of culture, as my experience is that they always come very mixed, and too much like bad onions. To obtain the very best results for exhibition some extra care must be bestowed on them. Select, if possible, a southern site, which should be thoroughly trenched, and, as in the case of onions, can hardly be made too rich. Allow a distance of fifteen inches between the rows, and one foot from set to set. Firm, medium bulbs should be selected, and frequent dressings of farmyard liquid should be given, mulching the ground after growth has commenced with half-spent horse droppings. When the growth is completed, it should be carefully laid down for a week or ten days before lifting the crop. Every care should be taken to thoroughly expose and ripen the bulbs before storing, and in wet, sunless weather they should be placed in shallow boxes under cover; cold frames will answer the purpose well. The bulbs, or cloves, as they are generally termed, should be large, firm, thoroughly ripened, of a good bright colour, and with small necks. Twenty-five will make a good dish, all of which should be as alike as possible, and arranged on a large dinner plate. There are now several very excellent kinds in cultivation, but the old Chester variety is still one of the best for ordinary purposes. Veitch's Exhibition, Carter's Mammoth, and the Red Skinned are the best for competition.

Aldenham House Gardens. E. BECKETT.

GARDENERS AND CHARITABLE CONTRIBUTIONS.

WHILST some writers are freehanded in sermonising gardeners because they do not more freely contribute to the funds of the gardening charities or the United Horticultural Benefit Society, it is very interesting to find the chairman of the recent Gardeners' Benevolent dinner, Sir Oswald Mosley, as also the treasurer, Mr. Harry Veitch, lamenting the fact that generally such poor wages are paid to gardeners. Does it not occur to writers that the primary cause cf the lack of contributions to the objects named by gardeners is largely due to this cause? That gardeners are as thrifty a race as any other body of workers there can be no doubt, but they cannot spare money to contribute to everything. I do not say that the large benefit societies present in any way such attractions as the United Horticultural Benefit Society does, because that is one of the very best of its kind in the kingdom. But the objection largely entertained towards it by gardeners is that, having no branches, they can take no active part in its management, and for that reason have in it very little interest. It is because large societies like the Oddfellows, Foresters, Hearts of Oak, and others have branches everywhere that they have become so popular and are so universally supported by the classes to whom they appeal. Then how many gardeners who, when young have become members of these large benefit societies, and once having joined they stick to them. There are, of course, good reasons why they should do so. How many, again, have insured their lives, believing that in doing so they were performing a most meritorious act. Tnat, again, necessitates the payment of annual premiums. How many, specially driven to do so by the necessities of their positions, get married, and in doing that assume heavy financial responsibilities, which increase rather than lighten as the customary family increases; and when to these things is added the fact that relative to the wages paid to ordinary artisans and mechanics, the wage of the gardener is small, how can it be expected that he should be able to find money to contribute to yet other societies, even though they may be such as command his liveliest sympathy, as well as invite his pecuniary support? Then, any gardener is assumed to be a saving man, in the sense that he would use the facilities for that purpose the Post Office places at his disposal. To be in no better position than that he is absolutely dependent week after week on his wages, and has not a penny saved up as a nest-egg, and when trouble comes is enough to render the life of any sensitive man one of intense worry and of bitterness. How many a man who has suddenly passed away has been harshly blamed because he has saved nothing, and made no provision for his family, without any inquiries being made as to his opportunities and capacities? When speaking to the members of the United Horticultural Benefit Society some time since, I said that whilst the popular demand was for a "living" wage, I went further and asked for a "saving" wage, because, unless a man could not only "live" but "save," life was one constant state of bankruptcy, and it was not worth living. I do not wish to shield from the full performance of their responsibilities any of our well-paid gardeners; but much more charity would be shown towards those who are not only so poorly paid, but whose position, unlike the mechanic, are held by such slender threads that he may be in for a few years and out for many months, and thus have every halfpenny he has saved absorbed for sustenance. A. D.

CLIVIAS.

Among the many useful flowering plants available for spring and early summer Clivia miniata and its many fine varieties are worthy of special mention, and more extensive culture. Useful as they are for small gardens, grown in small pots for table, hall, and conservatory decoration, they are even more useful in establishments where there are large conservatories and winter gardens to furnish and brighten. Grown in large pots or tubs they are effective as specimens for standing alone, as the soft shades of orange in the trusses of bold flowers, together with the shining and deep green foliage, render such examples extremely handsome. For cut flowers also clivias are excellent, keeping fresh a long time. The clivias are of easy culture, and especially so as they are not often attacked by insect pests. Having such thick fleshy roots clivias are naturally gross feeders; in this respect it is not unlike the agapanthus, and, like it, will submit to a great deal of rough treatment when not flowering. A suitable compost for clivias consists of rich loam with a little wood ashes and some leaf-soil; when established and growing freely plenty of water is necessary, but when growth for the season is complete much less is required, for though the ball of roots and soil should not become absolutely dry, they should tend to dryness rather than a state of moisture. The temperature of a greenhouse will suffice, and for early plants an intermediate house will best serve; to retard the plants it is necessary to keep them as dry and cool as possible apart from causing injury to them.

The photograph sent [reproduced herewith] represents a specimen that flowered here a short time ago; it, however, does not give an adequate idea of the example, owing to the reduction necessary. The specimen figured was five feet high, including the pot, and five feet five inches across; some of the leaves were three and a quarter inches wide. The trusses numbered thirteen, with an aggregate of two hundred and twenty flowers; one truss carried twenty-seven flowers. Though only in a fifteen-inch pot, this plant flowers freely every year, and has not been potted for several seasons; it is fed occasionally when the spikes are appearing, and also again when growth is vigorous. The form is that known as Clivia miniata superba.

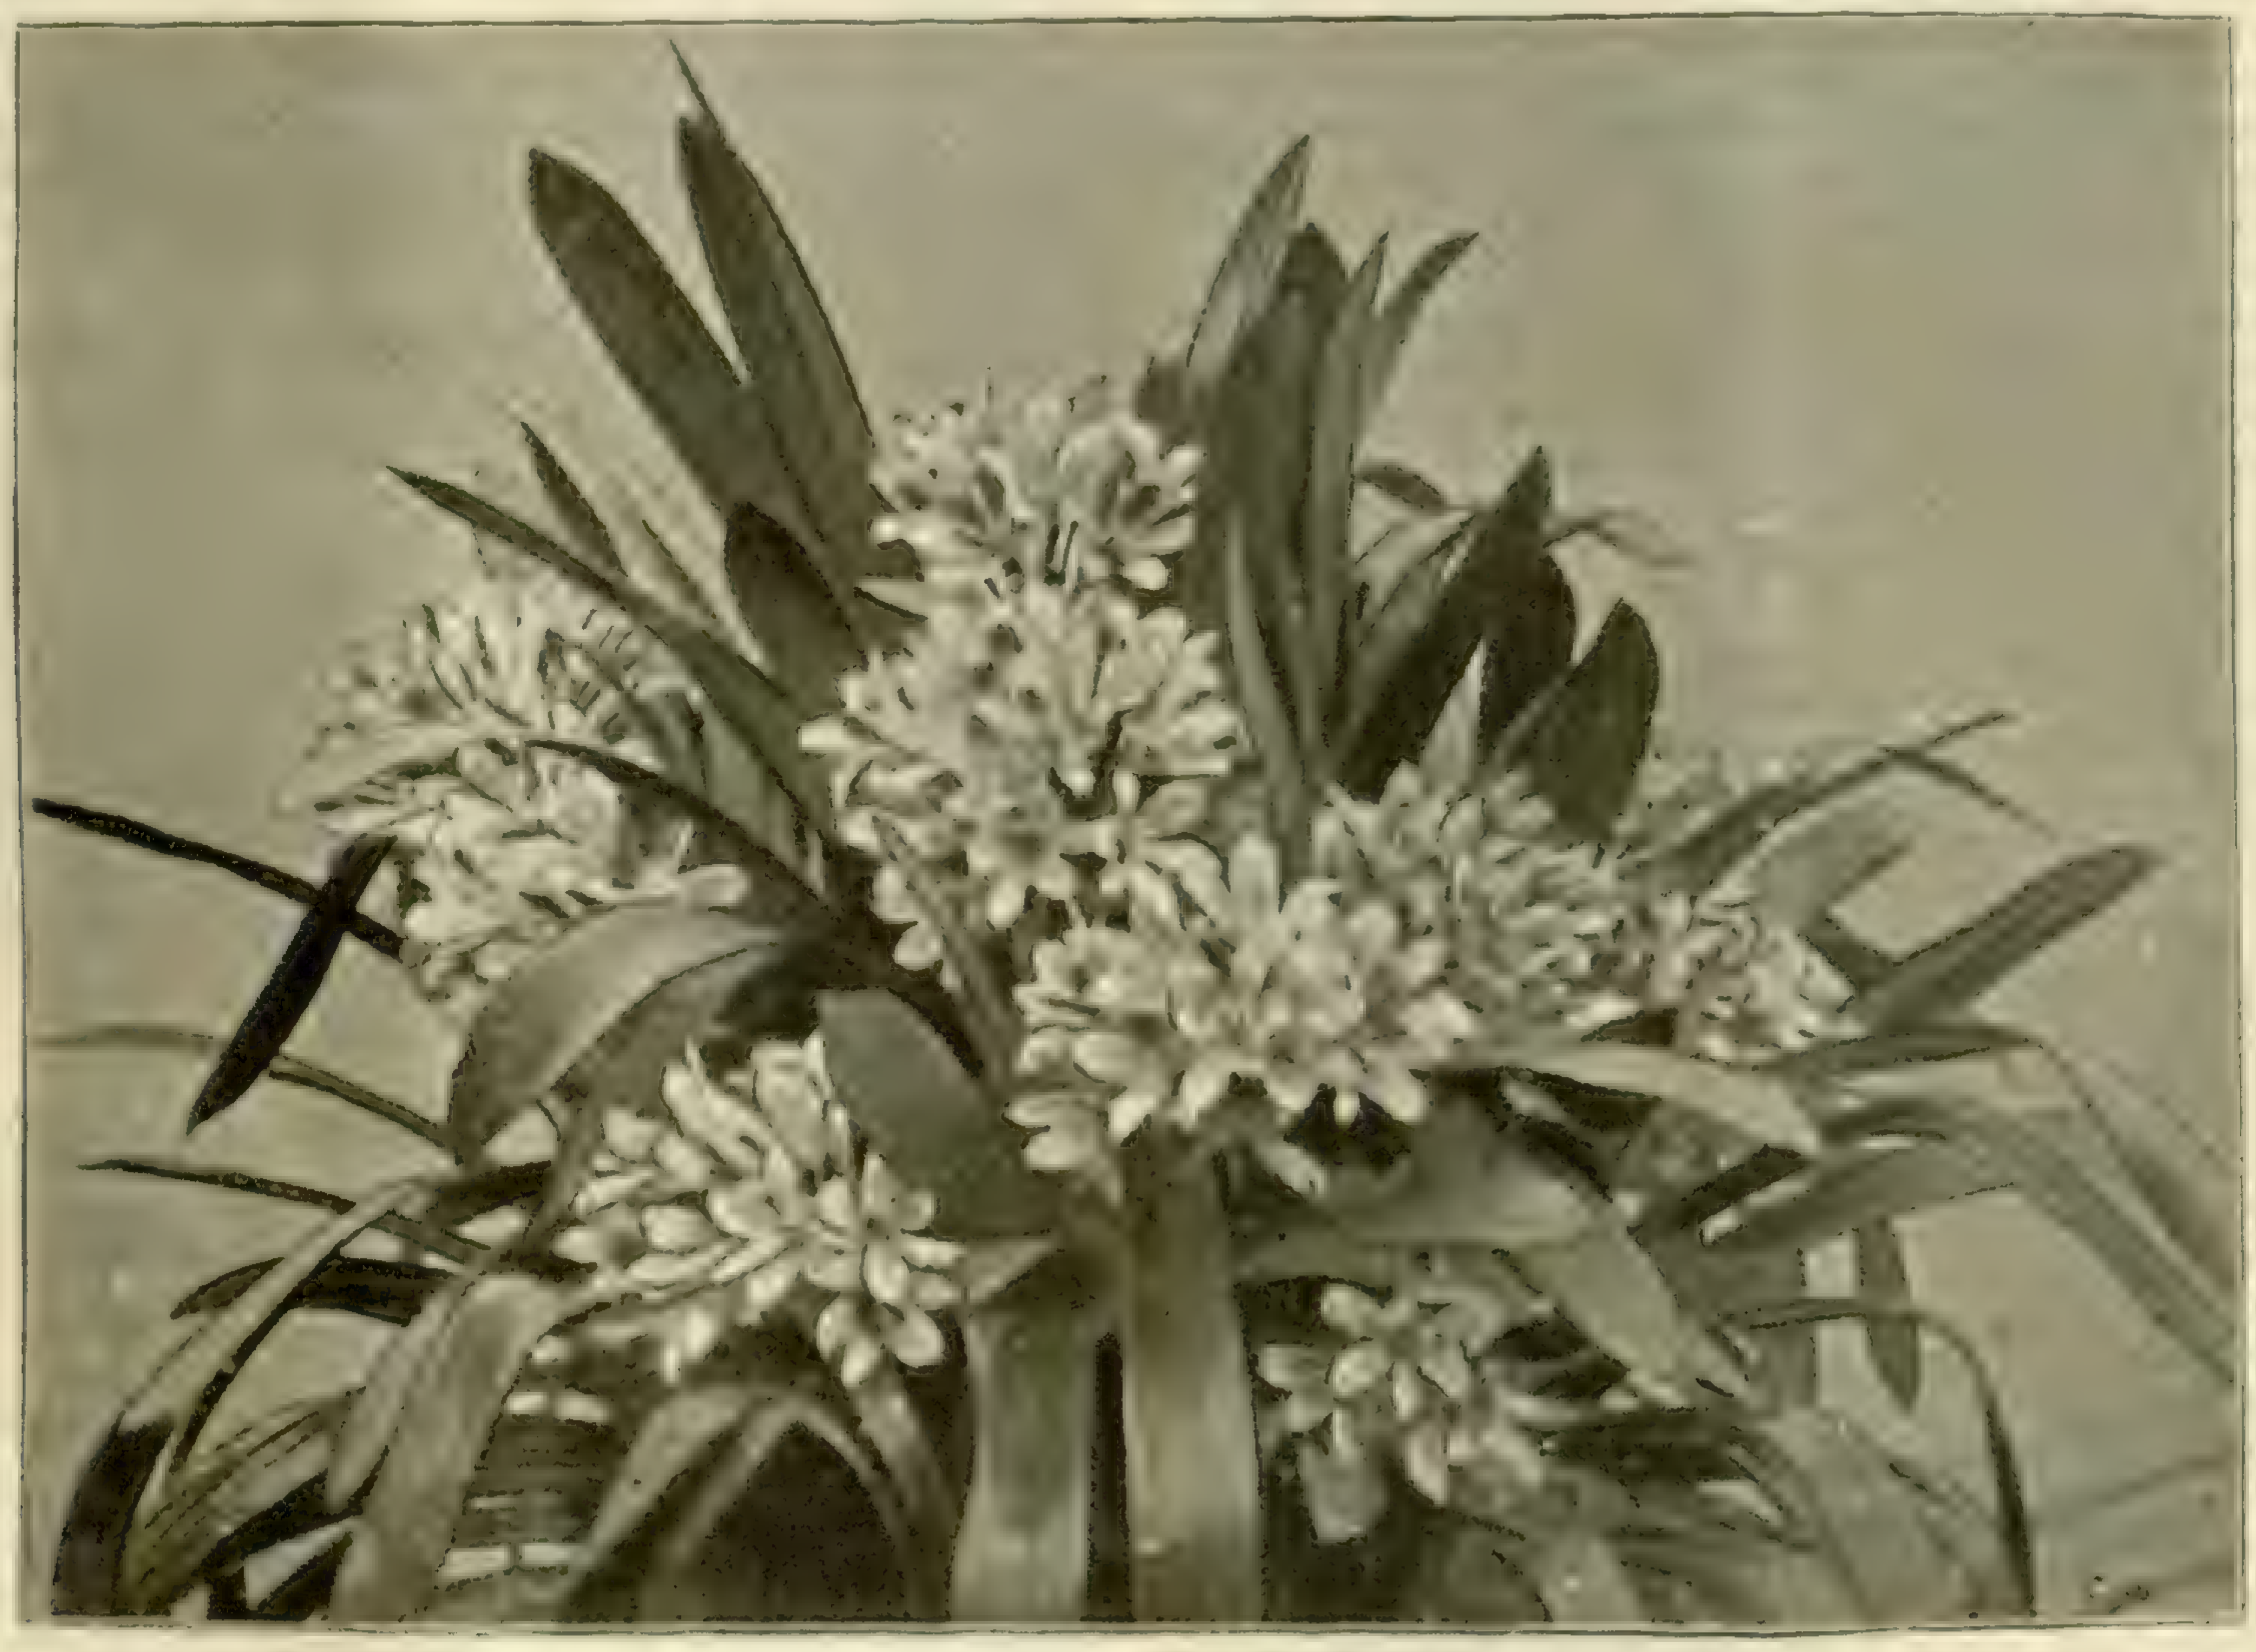
Fairfield Gardens, Cobham. JOHN WALKER.

Average life of the Potato.—I fear Mr. Davies' experience of Duke of York potato has been too limited to allow of his forming a good estimate of its capabilities. I can quite understand its being later than Ashleaf in such a trial, presuming that the latter was from home grown stock and the former bought in, as in that case it would probably have lost its first shoots and been weakened in losing them. I find it the most precocious, and the most prolific early potato I have grown, and it is only by keeping the seed in a much cooler place than that in which the rest of our seed potatos, Ashleaf included, are kept that I can preserve the first shoots at all, and it is very necessary that they should be so preserved. I think Mr. Davies must stand alone, or almost alone, in claiming Ashleaf as the best cropping early potato, and Magnum Bonum as the heaviest main crop. I own to the good qualities of the latter in many respects, but I could name many that would beat it as a cropper, and good potatos too. I ask again, What has become of the many good potatos which have risen and fallen during the last thirty years? Why have they dropped out? It cannot be because of the "bad practice" to which Mr. Davies alludes. I fail to see how that affects the matter. Surely our practices have not gone back, or is it that we only now know how to grow the newer potatos and the older ones are beyond us. If one began to reckon the names of those which have been in their day in the first flight, one would hardly know when to stop, but I refrain.—J. C. TALLACK.

LÆLIO-CATTLEYA HIPPOLYTA.

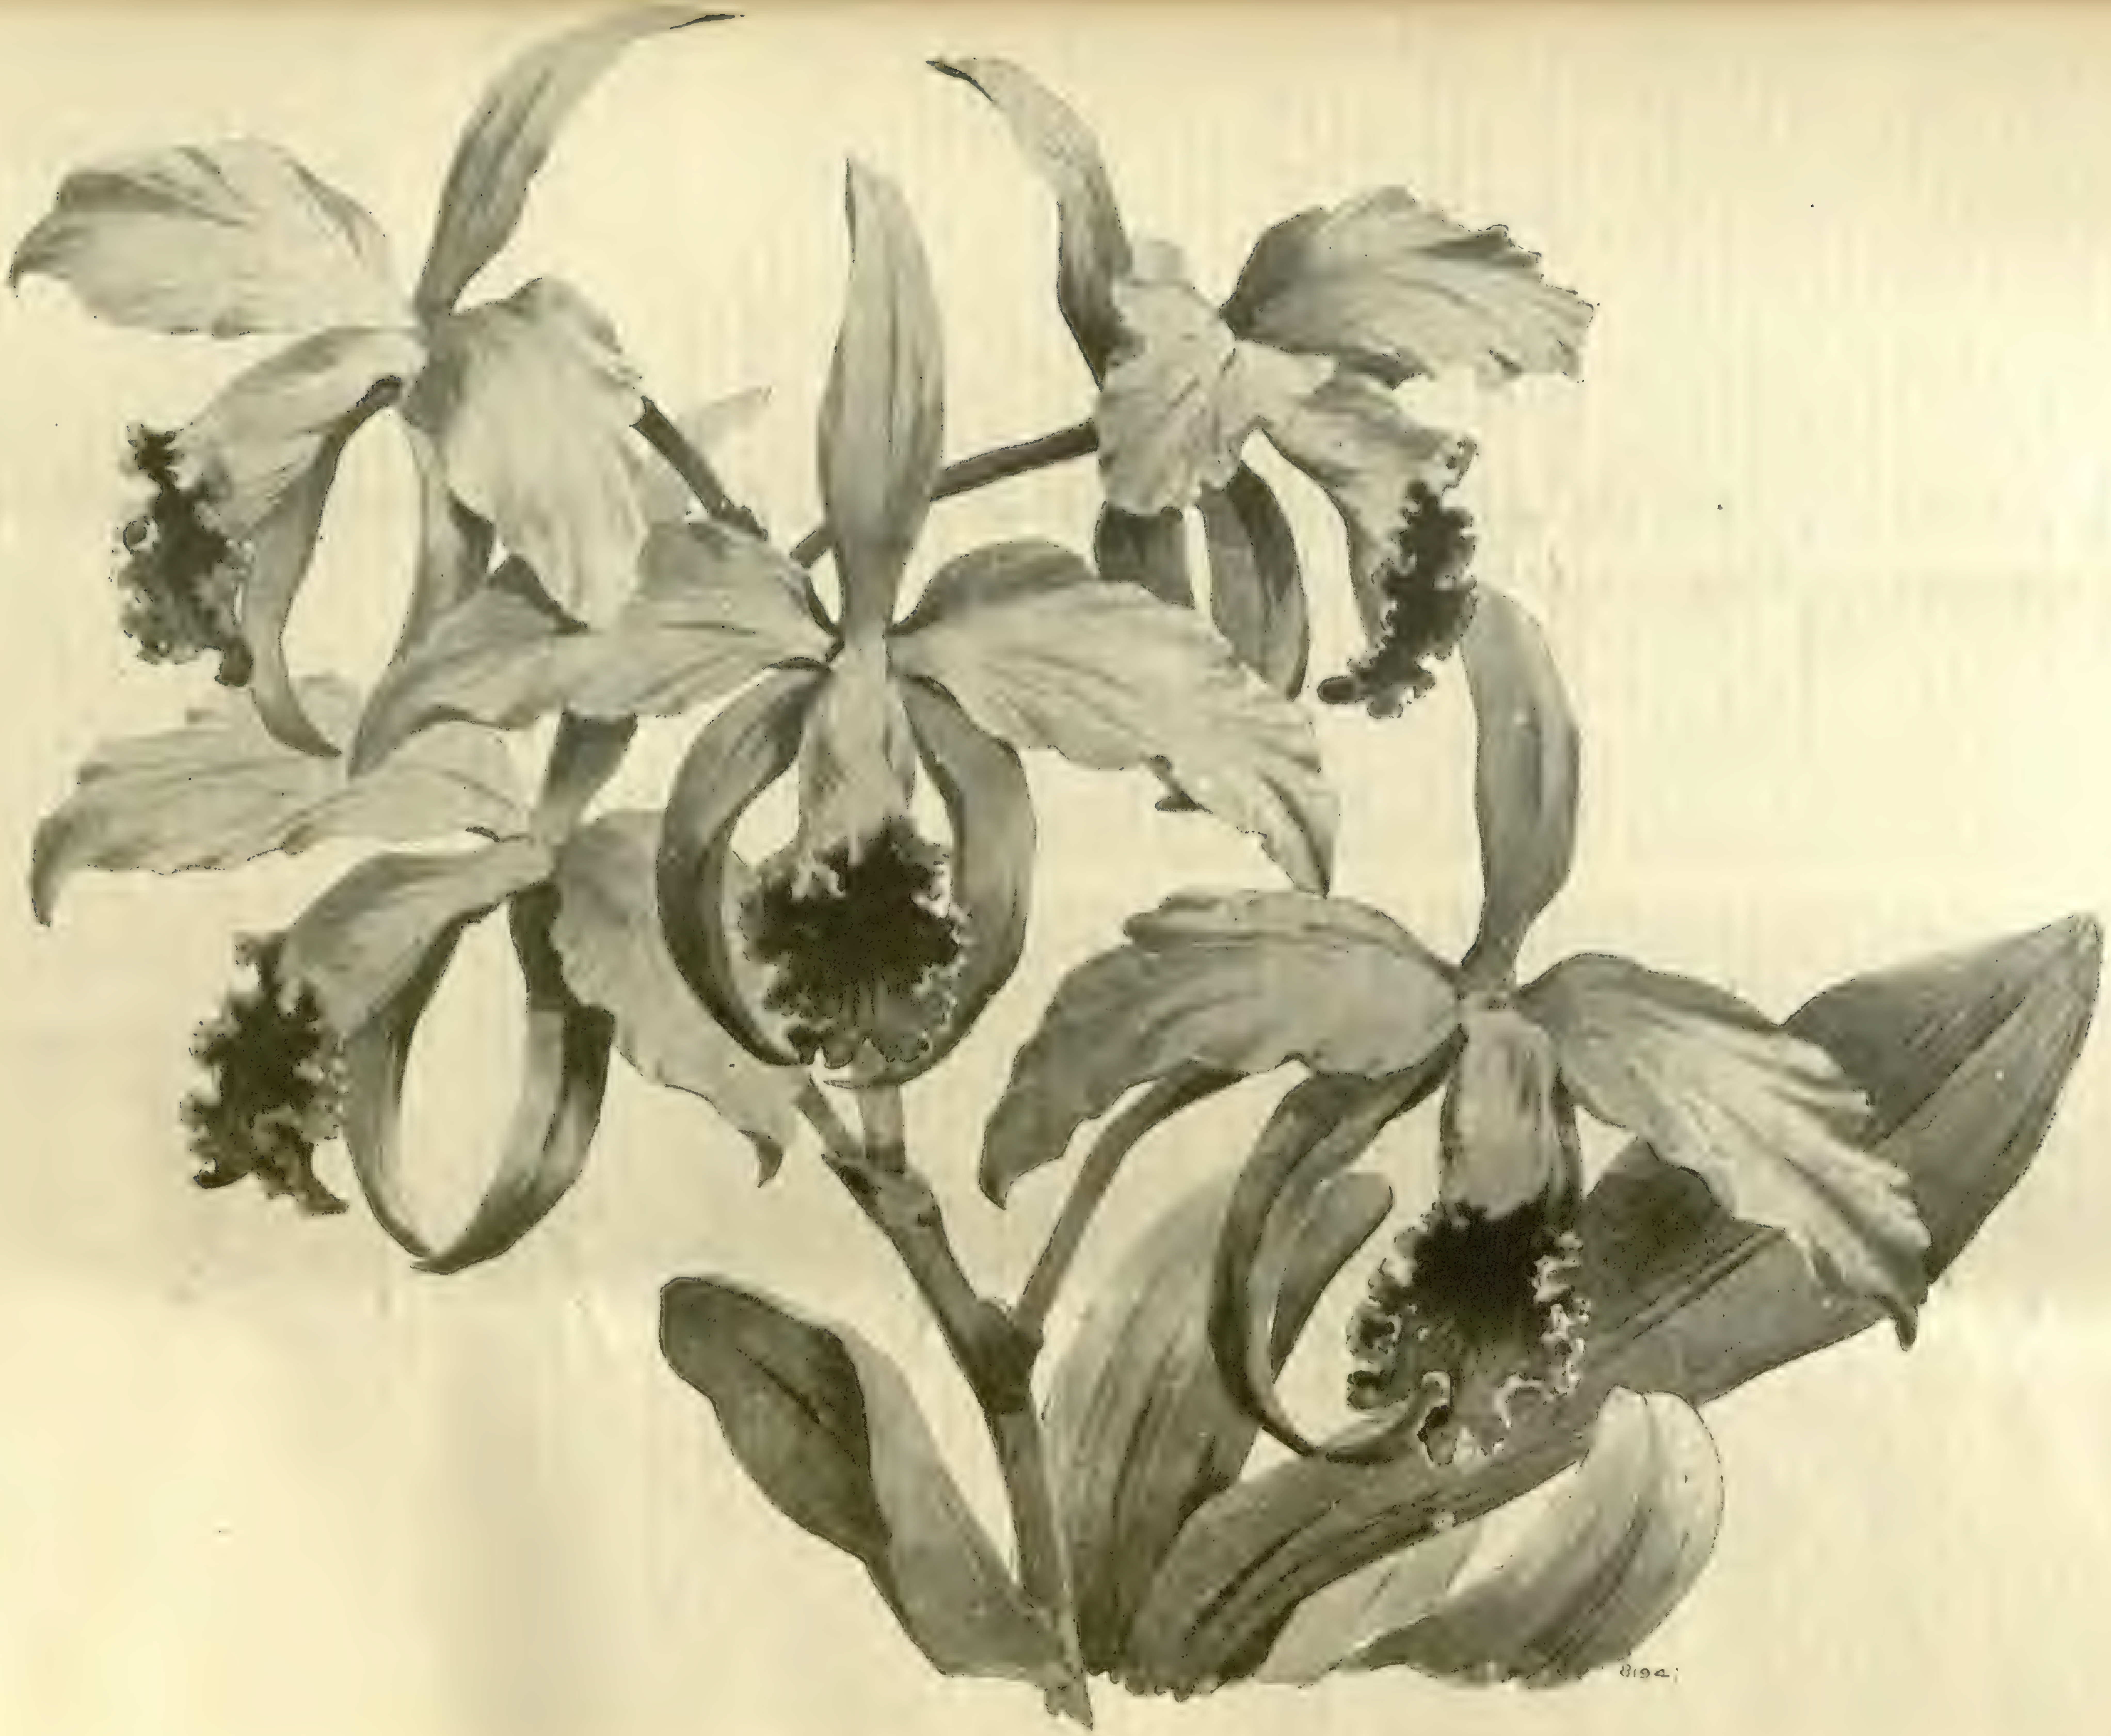
For brilliance of colouring none of the many handsome bigeneric hybrids raised between a lælia and a cattleya can excel L.-c. Hippolyta. One or two others, notably L.-c. Latona rival it, and are in themselves very beautiful and distinct; L.-c. Hippolyta, however, is both distinct and handsome, its spike of spreading flowers providing a glorious bit of rosy-orange colour that serves to increase the beauty of other lælias and cattleyas that may be flowering at the same time. This grand hybrid was raised by Mr. Seden, and is the result of crossing Cattleya Mossiæ with Lælia cinnabarina; the former parent has increased the size of the flowers of the latter and broadened the segments, while the lælia has given its rich colour and modified the shape of the lip considerably. L.-c. Hippolyta was exhibited before the Royal Horticultural Society on March, 25, 1890, by Messrs. J. Veitch and Sons, Chelsea, and a first-class certificate was readily granted. The flowers measure four to five inches across, the sepals an inch, and the petals about an inch and a half in breadth; the sepals are bright orange, but the petals are a charming rosy-orange shade, while the narrow and exquisitely fringed labellum is deep rosy-orange, with a purplish crimson margin.

As in other instances where a batch of seedlings is raised from the same cross there has been seen some variation in the individuals, some having flowers showing a buff rather than an orange tint, and having narrower segments than usual. Then, again, there have been superb forms with larger and more deeply coloured flowers than the majority—gems of the first water. Among the latter the variety now figured takes the lead as a consequence of its vigour, high colour, and fine flowers. Lælio-cattleya Hippolyta Dulcote var. was exhibited at the Drill Hall on May 10 last by Walter Cobb, Esq., Dulcote, Tunbridge Wells, a gentleman who has a large number of rare and exquisite orchids in his interesting collection. This variety is not only fine in itself, but it has been highly cultivated. When exhibited it carried a spike of five flowers, consequently a first-class certificate was awarded. The flowers are about five to six inches across, with petals of a lovely orange shade, through which comes a glow of purple-rose that reminds one of Cattleya Mossiæ; the orange tint is deepest towards the margins, and is very intense upon the broad and somewhat waved petals. The lip is a wonderful organ, broader than in most forms, the side lobes overlapping and hiding the column, orange coloured; the spreading apex has a beautifully frilled margin; the colour is orange-crimson, with a marginal tinge of rose, and with a good deal of yellow towards the purple-lined and shaded base. We congratulate Mr. Cobb upon possessing such an orchid, and also for the high cultural ability of his grower.



SPECIMEN CLIVIA AT FAIRFIELD, COBHAM.

Lilies of the Valley.—If the persons who so frequently send to the papers complaints of the poor condition of their lily of the valley beds could but see the superb beds which Messrs. Hawkins and Bennett have at Twickenham, and learn their treatment and then follow it, we should hear less of these complaints. These large beds, some eight feet wide and one hundred feet long, are planted, to be covered with frames and lights. No bed remains longer than eight years before it is removed, the best of the crowns being selected, then replanted in fresh soil, the old being removed and replaced with fresh. The selected crowns are then set in just under the surface, and at about three inches apart. A good dressing of very short manure is given. Such a dressing is given every year, and occasional soakings with liquid manure are also furnished. Once well established the plants bear ample feeding, and that is best given whilst they are growing during the summer.—A. D.



LÆLIO-CATTLEYA HIPPOLYTA DULCOTE VAR.

WORK FOR THE WEEK.

WARM ORCHIDS.

UP to the present time potting has been the work of greatest importance, consequently insect pests have had more opportunities than usual, so it would be as well to have a general examination and cleansing of the stock. The cattleyas, at such busy times, are apt to get infested with scale, especially around the base of the bulbs, clouding the dormant eyes; this pest must receive immediate attention, being injurious and unsightly. Cattleya aurea is generally first attacked, and if the plants are not in the best of health they will suffer considerably. In the case of Cattleya Mossiæ, C. Mendeli, C. gigas, C. Warneri, C. labiata, and C. Harrisoniæ, a good and a safe plan is to paint the base of the bulbs with methylated spirits in a pure state, using a soft camel-hair brush; this is a successful remedy, but great care is necessary in its use, for if the spirit comes into contact with the roots they are likely to suffer. I have experimented on the bulbs, but not on the roots, and would not recommend others to do so. Cattleya aurea will require more water during the growing season, but do not deluge it if the plants are to be kept in a flourishing condition. Discretion must be used as to the outside conditions as well as the inside; watering twice a week is quite sufficient, though during hot, dry weather frequent damping is essential. The second growth on an imported plant is generally the strongest flowering growth, and if flowering fails, then the third proves to be the best, but after this a rest is essential, bringing it again on a par with the previous year. If convenient, less shading should be given this than the members of the general collection of cattleyas; the foliage will appear light in colour under this treatment, but the tint is natural, and we always find imported foliage yellow. Another queer subject is Cattleya gigas, which will be found very easy to grow, but difficult to flower, and hence is not a great favourite with growers; this will be now advanced in growth, and must have more water afforded, but otherwise the same treatment as C. aurea; the same remarks apply to C. Hardyana and C. Massiana, which are natural hybrids between C. gigas and C. aurea.

Calanthe veratrifolia will be growing freely, and copious waterings will be necessary; this species thrives well at the warm end of the cattleya house, requiring plenty of shade during sunny days. It is an old orchid, and generally found difficult to grow, but if kept clean it usually does well; weak liquid cow manure, given occasionally during the season of growth, is very beneficial. The flowers of this calanthe are very useful for any floral arrangement. Chysis bractescens and C. aurea will be growing rapidly, so copious waterings must be afforded, taking care not to wet the foliage, or it will spot; weak liquid cow manure will be also beneficial to this and similar orchids. Great care is necessary now as regards shading, damping, watering, and cleaning; damping must be done in the forenoon, after dinner, and again in the afternoon; there must be a free circulation of fresh air night and day, with both top and bottom ventilation; liquid cow manure should be thrown on the floors occasionally as before advised, and the syringe used freely where advisable.—T. STAFFORD, *Tyntesfield Gardens.*

CONSERVATORY AND GREENHOUSE.

WINTER flowering or tree carnations will be now well established in their flowering pots, and abundance of ventilation should be given the plants to prevent the grass drawing up thinly. In some favoured localities, the plants may be partially plunged in a bed of ashes outside, but we find it best to use frames for them, so that the lights may be placed over, should there come a spell of dull, wet weather. When the soil becomes overcharged with water, the roots do not make healthy progress, which is soon noticed by the foliage losing its natural healthy colour. The lights can always be well tilted at the back, and what watering is required is best done each morning. One central stake is sufficient for most of the plants, the different shoots being supported by neat loops of raffia. When it is seen that one or more of the growths is taking the lead too much, the points of these should be pinched out, so that all may grow equal. During dry weather, the plants are greatly benefited by dewing the foliage over, and also the surface of the plunging bed between them. A slight shade will also prove beneficial for a few hours while the sun is hottest, but it is a mistake to shade them for long or too heavily. Cyclamens, cinerarias, primulas, and other winter flowering plants, should be arranged in shallow frames which are partially shaded from the sun. After each potting, it is necessary to keep the lights over them and the atmosphere moist, but we find when the plants are growing freely, they revel in being exposed to the night dews, whenever it is considered safe to draw the lights off. These plants may be grown to a large size in small pots, which makes them so much more acceptable for filling vases for room decoration. This should be borne in mind when potting, and to have them at their best, in, say, six-inch pots, a carefully prepared rich compost should be afforded, and this made fairly firm about the roots. Always crock the pots carefully, so that copious waterings may be given without fear of the compost becoming water-logged, and as the plants will be standing on a cool, moist base for many weeks, where worms prove troublesome, a little soot sprinkled over the drainage will prevent them entering the pots, and at the same time stimulate growth later on.

The shifting of chrysanthemums into their final pots should be pushed forward now, as such work should be completed if possible by the third week in the month. This is a heavy item of labour, and occupies much time in many gardens, but it is work that cannot be done hurriedly if the best results are required. We recommended preparing a good heap of compost for the purpose some weeks ago; this will now be in first-class condition. The pots, too, having been selected, cleansed, and crocked properly, will allow of the workman proceeding with his work without a check. As it is not always the best policy to water plants directly they are potted, two important matters must be seen to, viz., that the compost used is in a suitable moist condition, as well as the ball of the plants, at the time the work of potting is done. The plants should be carefully looked over about two hours beforehand, and any requiring water should have sufficient given to thoroughly penetrate every part of the ball, which will give time for this to drain off and leave the plants in the best possible condition for potting on. When a plant is watered and potted directly afterwards, there is a danger of making the soil go to a pulp by the ramming in of the new compost, and the plants never do well afterwards. It is also a mistake to arrange the pots in their permanent summer quarters until a week or fortnight after potting. By standing them fairly close together, say, in beds of four rows, so that they may be attended to for watering, &c., one shades the other to a great extent from the force of the sun, and by dewing them over several times a day during hot weather, and also between the pots, new roots are made in the fresh compost before much watering is required. When the plants have recovered from the check of potting and have commenced to grow again, they should be stood in lines and made secure to neat stakes or strained wires in such a way as not to shade each other. Even then watering should be done with care, but water should be given freely when the plants do require it. Pot on recently-struck cuttings; these will make compact plants and prove pleasing objects for dwelling-rooms if the points are taken out and about half a dozen or so of shoots secured. No endeavour should be made to force growth by feeding at the roots. Given a good compost the plants seldom require much assistance until the buds are secured, then stimulants of some kind act beneficially if used with care and wisdom. Over-feeding has been the ruin of many promising collections of chrysanthemum plants, hence the reason of my note of warning, especially to young men and would-be prize winners next November. —R. PARKER, *Goodwood.*

THE FLOWER GARDEN.

THE most important work of the flower garden at this season—the planting out of the summer occupants—should by the time this note appears be mostly finished, and where not completed an endeavour should be made to finish without delay. The stormy weather at the time of writing has been somewhat hindering the work, and the temperature much lower than is usual at bedding-out time, and, indeed, a summer below the average warmth seems very probable. The storms, however, that have fallen have not been sufficient to moisten plants to the roots, and all bedding stuff should have one thorough soaking of water given, while if a mulch of cocoanut-fibre refuse can be afforded where the arrangement allows of its being applied, further watering will not be necessary, at least for some time. In order to encourage a free growth in the plants calceolarias and pelargoniums should have the flowers removed for a week or so after planting, and the points of any long shoots taken out to induce a bushy growth and the covering of the allotted space as soon as possible. Window-boxes and vases filled with pelargoniums, &c., should be kept clean and free from decaying foliage, and where trailing plants are used on tall vases some means should be taken to prevent damage from wind; a piece of wire or string passed round under the rim of the vase, to which one tie may be made will suffice. Herbaceous perennials have made considerable progress during the past few weeks, although pæonies and other subjects are considerably later in blooming than has been the case in the few preceding years. The showers experienced have not been sufficient to moisten the soil around the roots of pæonies and others with considerable leafage, and these will be much benefited by an occasional soaking of water or weak liquid manure. Staking and tying of many occupants of these borders will be necessary, and this should receive attention before the tops become over heavy and tying is more difficult.

Several varieties of the tall-growing Michaelmas daisies will require stakes, and if it be wished to somewhat dwarf their growth, five or six inches of the tops may be taken off now, as this will not spoil the flowering. This treatment may also be given the tall-growing chrysanthemums or Pyrethrum uliginosum at the present time. One of the best blue-flowered summer perennials is Anchusa italica, producing freely stems from two to four feet in height, furnished with flowers of an intense shade of blue, and continuing in bloom more or less throughout the summer. The flower stems must be kept erect, and should be tied to stakes, and not bundled together, which spoils the effect. The double White Rocket, a very sweet, old-fashioned plant, and useful at this season where many cut flowers are required, should also be neatly tied to short stakes. The bright red spikes of the dwarf-growing Heuchera sanguinea are effective either in the border or when used for cut flowers. As soon as flowering has passed the plants should be lifted and divided if it be desired to increase the stock, and in any case, if the clumps are large, this operation will be necessary to ensure good flowering plants for another season. This plant appears to flower more freely in heavy rather than light soils, as here, where the latter prevails, the plants grow strongly, but the flower spikes are thinly produced, whereas in a clayey loam I noticed similarly sized plants were flowering profusely. Carnations are fast throwing up their flower stems, and these must be secured to small stakes, or where grown in reserve for cutting purposes they may have twigs of birch stuck around them to keep the flowers off the ground. It occupies less time than tying to stakes, and for this purpose answers just as well. Where large flowers are desired the small side buds should be pinched off early. Among the roses green-fly has increased wonderfully the past week or two, and frequent syringings with quassia mixture, as before advised, has become necessary to keep this pest under. The bushes should be thoroughly cleansed, if possible, before the blooms open, and if the liquid be used at a temperature of about 120 degrees the mixture is the more effectual. In the pleasure grounds where rhododendrons are grown, these should be examined while in bloom, and in the case of choice hybrids worked on the ponticum stock, any shoots growing away from the latter should be removed, otherwise in time they outgrow and destroy the variety worked upon it.—C. HERRIN, *Dropmore Gardens.*

HARDY FRUITS.

SINCE penning my last calendar note we have experienced most changeable weather, cold nights being the rule, with much rain and little sun heat by day, and though the moisture was much needed for the roots, wall trees especially being very dry, the want of sun has caused insect pests to spread rapidly, and these, unless taken in hand at an early date, will cause much mischief. Cherries come first, as these are badly infested with black fly, in spite of much attention early in the season, and as the fruits of the earliest varieties are growing fast and will soon show signs of colouring, there must be no delay in cleansing, otherwise strong insecticides will render the fruits uneatable. Much may be done by stopping previous to washing the trees; indeed, neglect of stopping is often the cause of the trees being dirty, as I have found trees regularly pinched out, and not allowed to grow so long that the knife must be used, are not nearly so subject to attacks as with stronger shoots. I noted the importance of early stopping some weeks ago, and now add that there will be no gain in further delay, or, with black fly so troublesome, the crop will be ruined. Previous to a final cleansing in our light, shallow soil, I always find it advisable to give a good mulch of manure—spent mushroom bed manure is excellent, but one is often obliged to make shifts, and any strawy manure will answer well; this is necessary as the cherry so soon feels the [illegible] of strong sun heat after dull, rainy weather, and the roots being near the surface are greatly benefited by the mulch given just as the fruits are taking their final swelling. Cow manure in light soils is an excellent mulch. There must be no further delay in netting, and give as light a cover or net as possible, as a heavy cover induces insect attacks, and prevents the trees benefiting by night dews which are helpful to the foliage. If a heavier shade is needed to preserve ripe fruit, far better use it during bright sunshine in the way of any extra cover of tiffany or canvas than as a permanent shade. Cherries split badly if the season is wet when the fruits are quite ripe, and any crop to be kept may well be protected by boards or sashes placed over the roots to throw off excessive rainfall.

Apple trees in many places need attention even at this early date, as I notice there are bad attacks of caterpillars. Space does not permit me to deal at length with the various remedies for their destruction; these are well known, and should be used as early as possible. A great deal may be done in the case of small trees by handpicking and burning the grub, and then giving the trees a dressing of insecticide by syringing freely late in the day. I also notice the dreaded American blight, in spite of a dripping month, has made its appearance, and no time should be lost in exterminating this pest, as allowed to remain it will soon kill the trees;

I find soluble petroleum effective, and this may be procured ready for use at a small cost, or raw petroleum is readily made soluble by mixing with soft soap; in very bad cases it may be necessary to paint the portion infected with the petroleum, not diluted. Now is a good time to give young fruit trees, such as apples and pears, a good mulch; this is specially necessary with trees against walls, the mulch keeping the roots growing freely, as these trees, having no large roots to depend upon, are much sooner affected by drought.

Strawberries will now be showing colour where grown specially for early supplies, and the value of young plants for the first crop will be seen in such a season as this, as these plants are much more forward than older ones. I advised on mulching early in previous notes, and its value will now be seen, as the mulching material is well cleansed by rains, and will also protect the roots from drought should this set in. Royal Sovereign is again our earliest fruit, and earlier than Noble or Laxton's Earliest; it is certainly our most useful variety, and does so well in poor soils. On the other hand all kinds are much later than usual, doubtless owing to the cold nights and want of sun, but the crop is a heavy one. For a few early dishes in the open it will well repay growers to cover a few of the forward plants with spare sashes, as by so doing the crop will be hastened and the season prolonged. This advice may be more useful in the colder parts of the country, but even here we find the larger fruiting kinds well repay for the cover given. With an abundance of bloom it will be well to lift the trusses into better positions to ripen, as they are much weighted down by heavy rains and will benefit by exposure. There must be no delay in netting the earliest fruiters, and this is often done by laying the nets directly over the leaves, but it is not the best plan, as the larger birds settle on the nets and have the best fruit; it is much better to support the nets with a few rods or sticks; indeed, if they can be suspended so that the fruits can be gathered without moving the nets it is a great gain in every way.—G. WYTHES, *Syon Gardens.*

USEFULNESS OF CRUCIFEROUS PLANTS.

THE plants constituting the cruciferæ order are mostly herbaceous in character, and particularly abundant in the temperate parts of the northern hemisphere. Though they mostly possess pungent or biting properties, none are poisonous, but, on the contrary, are eminently wholesome and antiscorbutic. The following best known examples of the order will illustrate this: Horse radish (*Cochlearia armoracia*), a perennial herb naturalised in this country, occurring in damp, waste places, and found throughout the greater part of Europe. Under cultivation it forms a thick, somewhat fleshy root, and is much valued as a condiment. Mustard is another condiment of equal or greater value, and is the finely pulverised seeds of two species of *Brassica*—*B. alba* the white, and *B. nigra* the black mustard. They are annual plants widely distributed over Europe, *B. alba* occurring also in Asia Minor, Algeria, and China, and cultivated in the home counties of Essex and Cambridgeshire; while *B. nigra* is also found in Asia Minor, as well as in North Africa and North-West India, its cultivation in this country being chiefly carried on in Lincolnshire and Yorkshire. In the preparation of mustard, or flour of mustard of commerce, the seeds of both species are used mixed, and great care is taken in reducing them to a very fine powder, which is sifted through a fine silk gauze. Besides the use of mustard for table purposes, it is an important medicinal agent on account of its powerful stimulant and rubefacient properties. The cabbage (*Brassica oleracea*) is another illustration of a valuable esculent belonging to this important order of plants. In its wild state it is abundant on the cliffs by the sea coast in many parts of England, especially in the south-eastern counties. The effect of cultivation has produced marvellous changes in this plant, giving us all the varieties of broccoli, Scotch kale, savoy, Brussels sprouts, cauliflower, and even the red cabbage. The same power of culture has also changed the woody root of the common wild turnip (*Brassica campestris* var. *Rapa*) into the fleshy, globular root of our gardens, while the Swede turnip has sprung from another variety of the same species; and the rape, again, so largely grown by us as a green fodder, and on the Continent for the sake of its seeds, from which is expressed rape or colza oil, has originated from still another variety. The radish (*Raphanus sativus*) is still another of the esculent cruciferous roots. The plant is unknown in its wild state, but it has been suggested that it may have sprung from an allied species of the Mediterranean coast. In the early ages it was extensively cultivated in Egypt, and found its way into England about the middle of the sixteenth century. Gerard mentions four varieties as being known in 1597. We cannot leave this interesting family of plants without a reference to woad, the blue colouring matter used by the ancient Britons to stain their skins, and produced by *Isatis tinctoria.* At that early period its culture seems to have been general for the purpose mentioned above, as well as for dyeing cloths, but in later times the general introduction of indigo seriously interfered with the use of woad; and though it is still manufactured in some parts of the Continent, its preparation in this country is fast dying out, and at the present time is carried on only in the neighbourhood of Wisbech, and there it is still made in the most primitive fashion.—MR. J. R. JACKSON, in *Knowledge.*

Root Dryness of Trees.—Reading your recent leader on this subject my mind was irresistibly carried back more than half a century since, when there existed on the northern side of the town of Southampton a noble avenue of elms. It presented a singularly attractive entrance to the town from London then. But when the principles of Macadam in the art of roadmaking came to be adopted, and besides the formation of rounded, hard, impervious carriage-ways, broad gravel paths were formed also; and moisture that previously had easily penetrated to the roots of the trees ran off—deep drains or excavations being cut also for the laying down of sewer pipes, water or gas—then the trees began to shed their bark, and gradually to die. The townspeople believed that this bark-shedding was due to mischief, and rewards were offered for the conviction of the offenders, for no one then assumed that the trees were internally suffering. But one after another died, and presently nearly all disappeared. Now that is just the sort of trouble so many fine avenues of trees have passed through to their extinction. On the other hand how well old trees continue to grow and flourish on pasture, where they not only receive ample moisture, but also plenty of Nature's own food. It is a wise provision of Nature, that tree vegetation shall exist on food of its own production; hence it is that the leafage produced during the summer falling to the ground, largely held in position by the grass or general surroundings, either decomposes and is as food washed into the soil, or is drawn into the soil by worms, these often maligned creatures thus performing valuable work in the economy of Nature. Large old trees want plenty of moisture, and plenty of food. Many of our oldest and finest trees either stand quite alone, or are near river banks. The grand old araucaria at Dropmore owes much of its nobility and luxuriant growth to its contiguity to a lake of water.—A. D.

SOILS AND POTTING.

IN discussing the all important question of soils for pot plants at a meeting of the Massachusetts Horticultural Society, Mr. T. D. Hatfield said: Gardeners seldom fully agree about the proper soil for any crop. Few of us find ourselves having the same conditions of soil to deal with. Our soil may be heavy or light, the land high or low, and with every variation of exposure. We go from one place to another, and often wonder at our neighbour's success when we should consider failure certain. I have received plants with the soil so stiff that I have wondered how they ever dried out when once wet; and from another place where the soil would appear to be about the same as our swamp mud. An acquaintance of mine tells me that at one place where he was gardener the only bit of potting soil he could find was turf from what had at some time been a salt marsh. After it was broken up, and the air and frost went through it, he found he could grow almost anything, from a geranium up to an azalea. Everybody finds a way of dealing with the problem before him.

We gardeners, taken together, are a conservative lot. We believe in "leaving well enough alone." It is a good policy, and one which carries much weight with it, and respect also. There are methods which we continue, often because it is the custom or practice to do so, and often we cannot explain why. Much experience is scratched up in a hand to hand sort of way; we find out as we must, and often we are obliged to experiment for ourselves, for the best practice of one does not always suit the case of the other. The gardeners of the United States have to thank the old-country gardeners, and many of us our old country training; though much that we do here is done differently, yet an intelligent training helps us better to gauge our practice to the altered conditions, and these are principally of climate. Wrong we may be sometimes, and often too particular, but it is better always to err on the side of prudence.

Take the old books, and we shall read: "One-third of turfy loam, one-third of leaf soil, and a third of sand;" or it may be fourths, including rotted manure, or fifths, with peat added; but accurate measuring is tedious work, and too slow to suit Yankee ideas, so the tendency is toward simpler methods. As a matter of fact there are but few mixtures of soil in use to-day. Leaf soil, one of the best ingredients in any compost, is seldom used in any except private gardens. Many gardeners manage to get along without it. Well rotted manure is a good substitute, and in some cases is better. It is necessary, however, owing to the prevailing slipshod methods, that the soil should be light for potted plants. The man with a hose can over-water with safety when the weather is hot, and the plants soon dry out, and when it is cold artificial heat has the same effect. But you cannot persuade the old-time gardeners to use the hose, though they may see that it really makes little difference, if ordinary care is used. Many plants set down as requiring heavy soil may be grown as well in a light soil. Wherever the rose grower is located he finds means of meeting the natural wants of his plants. He may add clay, but will not if he finds he can succeed without it, and he is almost sure to do so.

Take azaleas. It used to be, and is yet in some places, considered necessary to import English peat in order to be successful with them. Ninety per cent. of these beautiful hard-wooded plants are still grown in peaty soil in England. Nothing succeeds like success there as well as here, even though it be arbitration! If an English gardener grows good azaleas in peaty soil he is not likely to change his practice. Ocular demonstration cannot be overcome, and if we will not be convinced by any other argument we must be by this. For instance, take a look at the azaleas grown by Mr. Charles Sanders, gardener for Professor C. S. Sargent, of Brookline, and you will see that azaleas can be grown in soil almost wholly lacking peat.

This brings us to another part of the subject. The successful cultivator of plants finds there are other considerations almost as important as the soil and its consistency. I have tried all kinds of soil for gloxinias, consulting this and that formula. I potted them in light soil, heavy soil, rich and poor, all to little advantage. With these handsome tuberous-rooted plants much depends on caring for the tubers during what is called the resting season, though they are never absolutely at rest and we made a mistake when we enforce it by removing the tubers from the soil in which they had been growing and storing them in dry sand, as is frequently the practice. They should never become thoroughly dry, for living roots will at all times be found, and these require some nourishment. It is important that we should start with sound, healthy roots, start them slowly by withholding water until some leaf growth is made, and at all times keep them near the light, though not in direct sunlight. If we attend to these essential conditions we shall find that gloxinias succeed in almost any soil. Peat soil may be necessary for some ferns, but almost all of them will thrive as well in good loam and leaf soil.

It may surprise you to know that I have but one compost heap, and that is seldom as good as I should like to have it. Good turfy loam is not as plentiful as I could wish, and though it is really the best, some of us have found out how to get along without it. The old country carnation growers are extremely careful when mixing their potting soil—a barrow full of this and that and so much brick rubbish and charcoal; but the American grower prepares his in the field without a foot of turf; he must, and so he does. He has several methods, and perhaps the best and most common-sense one is to cultivate the area for stripping, growing thereon a crop of clover with no object beyond turning the best of what is put into the soil as manure into plant food of the kind which the carnation most needs. The American grower raises more and better carnations than his English compeer. He has, it is true, many advantages not possessed by the Briton. He has better light during the winter time, he has made a speciality of the work, and more than all, he has originated a new type of carnations. What I have said about carnation growing only goes to show that the importance of a prescribed composition of the soil is over-estimated.

When I first set out to pile up potting soil I scratched hard for turf. I landed in New Jersey, and those who have lived in the manufacturing districts about New York know how scarce a bit of turf is. I was bound to have it, and so made up a pile of witch grass dug from the road-side. It was not very bad, for witch grass does not grow in poor soil. I was delighted, however, when I came to Massachusetts, and the possibilities of a rare compost heap grew in my imagination; but I soon learned that turf here was not as free as water by any means. It is an old saying that "one never knows the worth of a thing until he wants to buy it." I was not to be baffled, however, and in less than a year I had half a dozen piles. I scoured the hollows in the woods for decayed leaf soil, and well remember coming across an old-time charcoal burner's camping ground in a clearing, well covered with turf. I thought I had now found just the right kind of soil for everything; but it proved to be the deadest stuff I ever used. Like a fancy dish it was no good without a dressing—a dressing of manure in this case. I made up my mind to keep my find a secret, and did until another was disappointed in the same way, and then, remembering that "misery loves company," I told how I had been deceived.

(To be continued.)

EXHIBITIONS AND MEETINGS.

ROYAL BOTANIC SOCIETY.

THE floral fête and children's parade was held on the 10 inst. instead of on June 8 and 9, the adjournment being made in consequence of the Drawing Room, and as T.R.H. the Prince and Princess of Wales could come to Regent's Park to award the banners to the most successful children's displays. The day, though dull, was fairly fine and there was a fine show, and a large and fashionable gathering to welcome their Royal Highnesses.

GROUPS.

Messrs. J. Laing and Sons, Forest Hill occupied their usual position, and on the semi-circular shape bank they arranged a most handsome group of flowering and foliage plants, associated in a most charming manner as regards colour and effect; tall and graceful palms afforded a fine background for crotons, dracænas, dieffenbachias, and other choice highly coloured foliage plants; before these came groups of the brilliant tuberous begonias for which the firm is famous. Towards the margin were fine orchids, chiefly cattleyas, and odontoglossums were arranged with phyllocacti, in variety, gloxinias, streptocarpus, and anthuriums; producing, with the fringe of green fern and isolepis, a beautiful effect that was much appreciated and duly admired. A most attractive and novel exhibit was put up by Messrs. J. Jackman and Son, Woking Nursery; this consisted of about thirty specimens of their beautiful new Clematis coccinea hybrids. The varieties were Countess of Onslow, Duchess of Albany, Duchess of York, Sir Trevor Lawrence, and Grace Darling. All the plants were well furnished with handsome foliage and elegant tubular flowers; most were on balloon trellises, but some were trained up poles and over rustic arches in a manner that displayed their beauty to the best advantage. A few maples, spiræas, and ferns completed an excellent arrangement.

Very bright and handsome was the display of rhododendrons and azaleas put up by Mr. J. Russell, Richmond, Surrey; all the specimens were remarkably well grown, and flowered profusely, being covered with handsome trusses of large blooms. To the effectiveness of the many fine rhododendrons was added the lighter grace, brighter tint, and sweet fragrance of pontic, mollis, and hybrid azaleas, all hardy sorts of great merit, including the famous Anthony Koster, Daviesi and Nancy Waterer. Messrs. J. Carter and Co. occupied a central position over the fountain basin, where a large draped stand had been raised, upon which the firm showed specimens of their petunias, begonias, calceolarias, gloxinias, streptocarpus, and other specialities, staging the flowering plants amid ferns and palms. From the four corner posts arches of asparagus and such flowers as gladiolus, Spanish iris and gloxinias were thrown to the central pole, and thus an effective exhibit was made up.

A delightfully fragrant display of roses came from Messrs. W. Paul and Son, Waltham Cross, and in it nothing was more admired than the set of pillar and bush specimens of the Crimson Rambler rose, beautifully flowered, and just in its best. The firm's own varieties were well represented by cut flowers or flowering plants of Spenser, the ever-blooming Enchantress, Sylph, Princess May, Clio, &c. The single Scotch roses, seedlings, were greatly admired, and the whole group was greatly appreciated by the visitors. Messrs. Barr and Son, Covent Garden, had a display of choice varieties of iris that made a fine show, because the varieties were staged in large sheafs; a white form, Mrs. H. Drew, was especially good. Poppies and pæonies were gorgeously effective; so also were the pyrethrums, the form named General Wallace, crimson scarlet, being especially noticeable. Lupins, delphiniums, eremuri, and hemerocallis were other flowers largely and finely exhibited by this firm. A large group of the effective, semi-double, salmon-coloured zonal pelargonium—King of Denmark, was arranged by Messrs. A. W. Young and Co., Stevenage. Messrs. W. Paul and Son, Waltham Cross, had, in addition to their lovely roses, a bank of rhododendrons, golden oaks, golden ivies, hardy azaleas, &c., with a number of tall specimens of Bougainvillea Sanderiana, charmingly flowered, rising between and above the other subjects; the rhododendrons were very fine. A group of the more popular orchids, such as Cattleya Mossiæ, C. Mendeli, Odontoglossum citrosmum, O. crispum, Cymbidium Lowianum, Cœlogyne Dayanum, and Brassia verrucosa came from L. Mond, Esq., Avenue Road, Regent's Park; these were arranged by the grower, Mr. J. Clarke, among ferns and palms on a sloping bank, and proved very attractive.

Primrose Queen, a broad-petalled and handsome carnation was stayed in first-rate condition by Mr. F. Perkins, Leamington. Mr. J. Russell's group of American agaves, both green and variegated forms, was not the least attractive or interesting exhibit. A handsome set of spotted, shaded, margined, and self-gloxinias from Messrs. J. Peed and Sons, Roupell Park Nurseries, Norwood, shows that the firm keeps well to the front as regards fine form, good colours, and erect habit in their flowers; streptocarpus made an appropriate edging to the gloxinia group. Messrs. A. W. Young and Co., Stevenage, made an extensive exhibit of cut hardy flowers, making special displays of poppies, pyrethrums, irises, and columbines; plants were represented by calceolarias and coleuses. A long table was occupied by Messrs. G. Jackman and Son, Woking, with a fine assortment of hardy flowers in bunches; the pyrethrums, rhododendron, violas, Geranium ibericum, irises, tritomas, pæonies, Papaver bracteatum, Aster alpinus superbus being notably well represented.

Messrs. Kelway and Son, Landport, Somerset, had a famous collection of pæonies and pyrethrums, and it was a pity the firm had not better opportunities of arranging these with some regard to effect. Among the pyrethrums we noted Pericles, yellow; Aphrodite, white; Lord Rosebery, deep red; Transcendant, rose; and Shotones, pink, as some of the finest doubles. The single varieties were equally beautiful, especially the very brilliant James Kelway, Cassiope, Bassanio, and Sir Hugo. The pæonies were extremely fine, both single and double varieties, but owing to the dullness of the day, and the fact that they were staged behind the pyrethrums, etc., they were not seen to the best advantage. Other interesting subjects from Langport were the amaryllis, splendid aquilegias, stately delphiniums, campanulas, irises, etc. When one considers the distance from Langport to Regent's Park, the display of Messrs. Kelway must be considered a wonderful one. One of the most graceful groups came from Mr. J. Russell, Richmond, who on this occasion was a most extensive exhibitor; the group in question consisted of hardy coloured foliage plants, and comprised a collection of the best Japanese maples, Acer negundo, tall and dwarf; irises, both silver and gold variegated, and both bush and climbing plants; euryas, and the brightly variegated Euonymus latifolia variegata, were grandly represented, as also were Prunus Pissardi and Cornus mascula aurea, a very fine exhibit. The Jadoo Company, Limited, put up an exhibit of plants of various kinds, both flowering and foliage, grown in their speciality, Judo fibre; photos of various specimens also grown in the compost, were also in view, and assisted to show the variety of subjects that can be successfully grown in the material.

Messrs. T. Rivers and Son, Sawbridgeworth, Herts, had a splendid lot of fruit trees in pots, chiefly Cardinal, Rivers' Orange, Stanwick, Elruge, and Dryden nectarines, and Grosse Mignonne and Dymond peaches. The trees were in that splendid health that always characterises the firm's exhibits, and they carried a large crop of splendidly coloured and full-sized fruits.

FLORAL DESIGN.

Floral decorations of a high quality were set up by Messrs. B. S. Williams and Son, Piccadilly, W. We greatly admired the superb basket of odontoglossums and cattleyas, the horseshoe of similar flowers arranged lightly over a foundation of white double narcissi, and the bouquet of golden Spanish iris; the fan of narcissi and pink carnations was cleverly done, while the wreaths of roses and croton leaves was a somewhat daring design. A basket of bright gladioli, associated with double white narcissi, was a feature in the collection of floral designs admirably arranged by Messrs. J. Laing and Sons, Forest Hill; their basket of marguerites, cornflowers, geums, and grasses was light and beautiful, suggestive of cornfields and country road sides; bouquets and baskets of orchids completed a pretty set. Mr. J. Russell, of Richmond, designed a lovely bouquet of Cattleya Mendeli, C. Mossiæ, and Odontoglossum crispum specially for H.R.H. the Princess of Wales, but by some mistake it was not presented to her.

MEDALS AWARDED.

Gold Medals: Messrs. J. Laing and Sons, Forest Hill; Messrs. W. Paul and Son, Waltham Cross; Mr. J. Russell, Kew Road, Richmond; G. Jackman and Son, Woking; Messrs. J. Carter and Co., Holborn; Messrs. Kelway and Son, Langport, Somerset; and Messrs. T. Rivers and Son, Sawbridgeworth. Large Silver Medals: Messrs. Barr and Son, Covent Garden; Messrs. A. W. Young and Co., Stevenage; and Ludwig Mond, Esq., Regent's Park. Silver Medals: Messrs. B. S. Williams and Son, Holloway and Piccadilly; Messrs. J. Peed and Sons, Norwood; and the Jadoo Co., Ltd.

CHILDREN'S PARADE.

The parade of florally-decorated children, go-carts, mail-carts, bicycles, &c., was as large as usual, but, on the whole, the arrangements did not appear to be of such a tasteful character as in some former years. The crowds of people who came to see the parade paid little or no attention to the Order of Council, "not to stand on the chairs," and so the view of a large number was obstructed. Fortunately, the rain kept off during the afternoon, but tent-roofs had been erected, and under these the parade was held, and here the awards to successful competitors were given by Her Royal Highness the Princess of Wales. The best display was a double mail-cart from Mrs. G. Kemp; this was prettily decorated with irises, rhododendrons, marguerites, and suitable foliage. The May Day Group, by Miss Lyndon, gained second prize, both pole and streamers being clothed with yellow and white marguerites and blue cornflowers. Mrs. Garford's "Ray of Gold" was pretty, and consisted of a decoration in yellow irises and marguerites. Mrs. Garford's pony-cart was a great success, being tastefully decorated with viburnums, rhododendrons, carnations, and roses, both over and around the vehicle. Miss L. Bayley decorated her bicycle with yellow Spanish irises and yellow marguerites. Indeed, yellow in various shades appeared to be the popular colour both for drapery and flowers. The single mail-cart from Mrs. Buck, the young lady decorated with seed packets, Carter's catalogue, young plants, and quite an array of liliums and other flowers, representing "From Seed to Flower," were both novel and interesting exhibits, as also was "A Little Gardener with Garden Produce"—flowers, fruits, and vegetables—by Mrs. Kelf.

SCOTTISH HORTICULTURAL ASSOCIATION.

THE Scottish Horticultural Association held a crowded meeting at their rooms, St. Andrew's Square, on the 7th inst. After the minutes of the last meeting were read and confirmed, new members nominated, and those nominated at the last meeting admitted, the President (Mr. Todd), in a few genial sentences, called upon Mr. Alexander Johnstone, of Hay Lodge, Trinity, to read his paper on the "Growth of Fuchsias for Home Decoration and Exhibition."

With a brief reference to its introduction, improved merit, and cultivation, Mr. Johnstone boldly affirmed that notwithstanding the inrush of orchids, stove plants, chrysanthemums, palms and ferns, the fuchsia still held its own place and power in modern decorative gardening. In his paper he hoped to prove true to the future, himself, and those amateur friends whom he might be able to assist in their laudable effort to grow fuchsias, and with at least as great perfection in the future as they had done in the past. Referring to the qualities of good fuchsias of different colours and form, in a few terse sentences, Mr. Johnstone was soon in the thick of his subject, preparing well-drained five-inched pots for cuttings, surfacing these with silver sand, filling them with cuttings about an inch or so long, protecting them with glasses, and subjecting them to a general growing temperature of fifty-five degrees, or so. January, February, or March are perhaps the best time on the whole for propagating fuchsias from cuttings. Pot off so soon as well rooted, and so soon as well established remove the fuchsias to greenhouse temperature and treatment. How to grow fuchsias to win first prizes: Mr. Johnstone, under this head, soon showed that he was not an advocate of the rush and race school that force early plants to win their spurs at a year or two old. On the contrary, he spoke of plants two, three, four, five, six, and in one or more cases of old stagers, eight or more years old, that were said to know their way about when taking taking first rank at flower shows.

Old or young, the fuchsia should be rested more or less in winter. Anything a few degrees above freezing will suffice—a temperature, say, from thirty-five to forty. Root dryness, comparative, not absolute, should be added to force the plants to rest.

Reduce the old balls, prune the roots, if desirable, remove most or all the old soil, and shift into the smallest pots the roots can be got into early in the year. If possible a bottom heat of from 60 to 70 degrees for a few weeks, with a moist atmosphere and partial shade, are useful at this stage, to help the roots to grip the fresh soil, and the stems to break away with equal vigour from base to summit. The best soil for fuchsias is about two-thirds strongest yellow loam and one-third of leaf-mould, with a fair propertion of gritty sand. Many growers add a dash of bone meal, or a thin layer of rich bones over the crocks.

The final shift should be given three months before the date of show, and the last stopping be given two months before the same. Mr. Johnstone's comparison of model fuchsias for show to small Cedrus Deodara was so true to our highest conceptions of nature and art among fuchsias that it deserves to live among cultivators as a genuine flash of a great man's genius. With this form and the pot crammed with healthy roots, well fed with a liquid composed of water, soot, and sheep manure the plants will continue models of elegance and freshness, as well as rain down showers of beauty throughout the season. Mr. Johnston recommended that only the finest varieties should be grown, and concluded by naming a few of the older that were still worthy of a place with many of the newer sorts so profusely illustrated and described in our trade catalogues of the day.

Mr. James Grieve led off the spirited and genial criticism that followed. He condemned the cultivation of old plants, stating that none over three years old should be awarded prizes by judges. From a humorous personal reminiscence, it seemed Mr. Grieve's dislike of old fuchsias dates from a painful experience of helping to carry a monster to a show.

Mr. William Carmichael related his experience in growing and judging Bath fuchsias, and stated the best he had ever seen were exhibited by Mr. D. T. Fish at Bury St. Edmunds, when two royal societies, the Royal Agricultural of England and the Royal Horticultural held their two great shows together in the provinces for the first time.

Mr. Fish on the whole agreed with Mr. Johnstone, to whom he conveyed a hearty vote of thanks. The older in reason the plants, and the fuller the pots of healthy roots, the more freely the plants bloom. Several speakers recommended the insertion of the cuttings in the autumn rather than the spring, August and September being probably more suitable for trade stock. Mr. Long directed attention to a useful mode of protecting young fuchsias in winter. Plants from four to ten feet high were lifted and laid in trenches about a foot deep. In the spring or early summer they were lifted, dressed, and pruned, and planted, and grew and blossomed freely. Mr. Charles Comfort, in opening the discussion, wished to add two hints. The first was, never throw a fuchsia away, however old, if doing well; the second is, never pinch and pot a fuchsia at the same time. Allow some six or ten days at least between the shifting and the pinching. Mr. Alexander Mackenzie, of the Warriston Nurseries, strongly condemned old fuchsias and their admirers as antiquated and out of the run of modern fashion of growing flowers, &c., and concluded with a brilliant epitome of the trade side of fuchsia culture. The President, whose father was a fuchsia grower in the west country, in conveying the hearty thanks of the association generally, gave expression to his views on the cultivation of fuchsias. In acknowledging the vote of thanks, Mr. Johnstone replied to his several critics, and expressed the pleasure he felt in having such a large audience. It was announced that the association would visit the nurseries of Messrs. James Grieve and Sons on the 25th inst. to inspect the violas and other good things at the establishment. D. T. F.

GRAND YORKSHIRE GALA, June 15, 16, and 17.

This well-conducted floral and horticultural fête is being held for the fortieth time as we go to press, and the display we now report is no doubt the finest of the whole series. There have been occasions when roses, for instance, have been a far finer show than on this occasion; but take it all in all York has seen no finer horticultural exhibition than that of 1898. In 1897 a fearful gale raged on the morning of the opening day, and, as we detailed at the time, the whole of the many large canvas erections were wrecked and a vast number of fine plants smashed into a shapeless mass, many hundreds of pounds worth of damage being done. The Gala Committee had a large balance in hand, and as soon as possible they obtained particulars and paid the expenses of all the exhibitors. This gave them a loss of about £1,000 on the year's working. On Wednesday last, however, the sun shone brightly on York, there was a genial air, and so the fashionable world of this fine old city turned out *en masse* to the féte. We hope that the total attendance has been so large as to result in a large amount of last year's loss being made up. In former years the Pressmen have had no difficulty in obtaining admission to the tents while judging was progressing and so performing their duties with ease. This season matters were not so pleasant, and at first it seemed likely that no admittance would be granted until the conclusion of the judging—an absurd arrangement. However, the genial chairman, Alderman Sir C. A. Milward, J.P., brought his influence to bear, with the result that the usual facilities for note-taking were granted. All the arrangements for the amusement of the visitors were much as usual, but the arrangement of the exhibition was different, the big pelargoniums, fuchsias, &c., occupying a side tent, leaving the centre for orchids, trade exhibits and groups This departure was a good one, for nothing much better than the general effect produced could have been wished for. May the York Gala prosper as it deserves, and may it be able to soon add many more hundreds of pounds to the amount already disbursed by its committee to local charities!

Groups.

In the class for a group of miscellaneous plants arranged for effect upon a space not exceeding 300 square feet, there were five competitors, so that this class in itself resulted in a really fine exhibition. The competition was fairly keen, and the chief award, of £20, was won by Mr. C. J. Mee, Floral Depôt, Nottingham, who had a tasteful arrangement, in which the highly-coloured crotons and graceful spikes of odontoglossums were especially effective. The background consisted of a wall of virgin cork and moss, in which anthuriums (both foliage and flowering kinds), crotons, dracænas, small palms, caladiums, and other graceful plants were associated in a most natural manner. The ground work of the whole scheme was deep green moss, and here and there were neat and elegant mounds of plants, arranged around some well-grown specimens of cocos, crotons, bamboo, &c.; dotted about the groundwork were smaller single-stemmed crotons of great beauty, liliums, and free-flowered masdevallias. In the front were several of these mounds, varying much in size; the conspicuous centre one was capped by a big Kentia Belmoreana, that was surrounded at the base with a lot of Odontoglossum crispum, O. Halli, O. luteo purpuream, Epidendrum vitellinum majus, and Anthurium Andreanum. The whole group was very handsome, and, though bright, was not gaudy, and had even a cooling and restful effect. The second prize went to Mr. G. Wilson, gardener to Sir J. Reckitt, Bart., Swanland Manor, Brough; the plan followed by Mr. Wilson was not at all unlike that of Mr. Mee but there were mirrors at the back and a pair of great arches of plants; in front of these was a huge boulder covered with ferns and bamboos, and over this trickled a tiny stream of water that fell into a little wandering stream below, where yellow nuphars reposed. Marantas, Rex begonias, caladiums, aglæonemas, and cypripediums were used with great effect, and a flowering plant of Medinella magnifaca was a prominent and pleasing specimen. Mr. J. McIntyre, gardener to Mrs. Gurney Pease, Woodside, Darlington, gained third prize with a pretty arrangement that was a trifle too crowded over the base; two tiny fountains were not a great success, but the cultural ability displayed in the crotons, alocasias, &c., was very great. Mr. W. Vause, Summers Place, Leamington, secured the fourth prize, while the fifth was won by Messrs. R. Simpson and Son, Selby, Yorks.

Orchids.

Mr. James Cypher put up a charming group of orchids, and with it succeeded in winning the Victoria prize of £20 and a gold medal. The group was arranged effectively with palms, azaleas, bamboos, asparagus, and similarly bright and elegant subjects. Two orchids, extending from the centre to the outer corners of the group, were clothed with cattleyas of various kinds, including plenty of the drooping C. citrina; graceful spikes of odontoglossums and oncidiums arched over either way, while reaching up from below were tall oncidiums and robust cypripediums. The ground-work consisted of groups of splendid forms of Cattleya Mossiæ, C. Mendeli, Odontoglossum crispum, Miltonia vexillaria, Masdevallia Veitchi, with the butterfly flowers of Oncidium Papilio hovering here and there among and over the whole; this group was a most refreshing sight. Mr. J. Robson, Altrincham, secured second place, showing massive clusters of odontoglossums and cattleyas; some fine plants of Oncidium sphacelatum were shown, but the associated foliage plants were too dense.

The first prize for ten orchids was awarded to Mr. J. Cypher, Cheltenham, who showed good forms of Cattleya Warneri, Lælia purpurata, Cattleya lobata, Thunia Veitchi, Odontoglossum hystrix, Epidendrum prismatocarpum, and Lælia grandis tenebrosa; Mr. J. T. Barker, gardener to W. Burkinshaw, Esq., Hessle, second, showing a good Epidendrum Medusæ. Mr. Cypher was also most successful in the class for six orchids, staging large examples of Cattleya Mendeli, C. Mossiæ, Thunia Marshalliæ, and Epidendrum vitellinum majus; Mr. Johnson, gardener to T. Statter, Esq., Stand Hall, Manchester, second; and Mr. W. Townsend, gardener to E. B. Faber, Esq., Belvedere, Harrowgate, third. Mr. Cypher came to the front again in the class for three orchids, winning with nice examples of Oncidium macranthum, Cattleya Mossiæ, and Lælia purpurata alba; Mr. A. Hall, gardener to J. E. Waterhouse, Esq., Macclesfield, second; and Mr. Johnson third. The best specimen orchid was a fine example of Lælia purpurata, carrying half a dozen lovely spikes of exceptionally-large and beautiful flowers. This came from Mr. C. Lawton, gardener to H. Harrison Broadley, Esq., Welton House, East Yorks; the second best specimen was a very large Cypripedium Lawrenceanum, shown by Mr. F. Nicholas, gardener to the Earl of Zetland, Upleatham; Mr. A. H. Hall, third, with a good Oncidium Marshallianum. For six rare orchids, Mr. J. T. Barker came first with small examples of Cattleya Mossiæ alba, Cypripedium bellatulum-godefroyæ, Lælia tenebrosa Charlesworth's var., Cypripedium bellatulum album, Lælia purpurata Othello, and Odontoglossum crispum Charlotte; Mr. Johnson second, his set including Cypripedium callosum Sanderæ, the fine C. Gertrude Hollington, and Dendrobium Victoria Reginæ.

Specimen Plants.

The specimen stove and greenhouse plants are always a great feature at the York Show, and they look fine arranged around the central pole of the big bell tent. Numerous large palms and crotons were also arranged this year at the end of the side tents, and were very effective in such positions.

Mr. J. Cypher once again put up his leviathan specimen stove and greenhouse plants, and once again succeeded in securing the leading awards. His group of ten specimens comprised grand examples of Latania borbonica, Kentia Forsteriana, Cycas undulata, Phœnix rupicola, Stephanotis grandiflora, Erica depressa, [a mass of yellow flowers; Phœnicoma prolifera Barnesi, Clerodendron Balfouri, Pimelia dionæfolia, a grand specimen; and Bougainvillea Cypheri. The second prize was won by Mr. F. Nicholas, gardener to the Earl of Zetland, Upleatham, Marske-by-the-Sea; this grower staged some very fine azaleas, an Anthurium Scherzerianum of first-rate form, and a splendid Ixora Williamsi in addition to other flowering plants, crotons and towering palms. Mr. R. Vause came third, with smaller but well-grown plants. Mr. J. Cypher scored for three cape heaths with medium-sized examples of the pink Erica ventricosa grandiflora, E. depressa, and E. affinis; Mr. C. Lawton, second; and Mr. J. Sunley, Milford Junction, third. Mr. J. McIntyre led the way with four crotons, staging big highly-coloured bushes of C. Sinitzeanus, C. Queen Victoria, C. Aigburthensis, and C. Baroness Rothschild. Mr. J. McIntyre, gardener to Mrs. G. Pease, Darlington, put up a first-rate half-dozen exotic ferns, taking first prize with ample specimens of Adiantum Mariesi, A. cuneatum, Davallia hirta cristata, D. Mooreana, D. fijiensis, and Gleichenia Mendeli; Mr. J. Snowdon, gardener to the Rev. G. Yeats, Heworth Vicarage, was a good second, with Gymnogramma chrysophylla, Davallia bullata, Asplenium nidus-avis, Polypodium aureum, Davallia hirta cristata, and Adiantum Williamsi, a fine specimen. Mr. J. McIntyre led for three exotic ferns with huge examples of Gleichenia rupestris, Davallia fijiensis, five feet across; and D. Mooreana. A good Adiantum Farleyense secured the chief award for Mr. J. Snowdon as the best single exotic fern; Mr. J. McIntyre second, with a smaller plant; and Mr. Nicholas third, with Lomaria zamiæfolia.

For six stove or greenhouse plants Mr. J. Cypher took first place with rotund specimens of Bougainvillea glabra, Aphelexis macrantha rosea, and a large mass of Anthurium Scherzerianum carrying fine spathes; Boronia elatior, Clerodendron Thomsoniæ, and Erica depressa were also first rate. Mr. C. Lawton, gardener to H. H. Broadly, Esq., East Yorks, was second; and Mr. M. Vause, Leamington, third. Mr. Sunley scored for three stove and greenhouse plants, showing Erica ventricosa, Genetyllis tulipifera, and Anthurium Scherzerianum; Mr. C. Lawton second. The best specimen of azalea was a huge mound of rosy flowers shown by Mr. J. Cypher, the variety was Holfordiana; Messrs. Jackson and Co., Bedale, second, with a beautiful soft rose-coloured variety. Mr. C. J. Mee was first for a stove plant with a robust specimen of Anthurium Scherzerianum; the second prize-winner's name was not recorded, but he showed a large stephanotis freely flowered though a little past its best; Mr. J. Rollison, gardener to W. Bateman, Esq., Pannal, Leeds, third, with an anthurium. Mr. J. McIntyre had the best half dozen ornamental foliage plants, his collection comprising three huge crotons and the same number of palms. The leading exhibitor of hardy ferns was Mr. W. J. Nicholson, Ripon, who won two first prizes and staged fine examples of Trichomanes radicans, Scolopendrium crispum, Lastrea filix-mas cristatum, Struthiopteris pennsylvanica, Osmunda interruptum, Adiantum pedatum, Athyrium f. f. Pritchardi, &c.

Cut Flowers.

A beautiful collection of hardy flowers put up in splendid sheaves by Messrs. Harkness and Son, Bedale, York, won the first prize, the group being arranged on a space eighteen feet by fourteen feet. Here were beautiful bunches of liliums, Spanish and German irises, pyrethrums, mulleins, Heuchera sanguinea, poppies, aquilegias, &c., the whole in first-rate condition, and making up a really fine display. The second prize was secured by Mr. A. Perry, Winchmore Hill, who had a fine exhibit of popular flowers; Messrs. R. Smith and Co., Worcester, secured the third prize with a bright group of pæonies, irises, and pyrethrums; Mr. W. Hutchinson, fourth. Messrs. J. Burrell and Co., Cambridge, secured first prize for twelve bunches of hardy border flowers with handsome sheaves of Iris pallida, Hemerocallis flava, Iris orientalis, Pyrethrum Pericles and P. J. N. Twerdy, Iris spuria, Heuchera sanguinea, Onosma tauraca, Hieracium villosum, Phlox ovata, and Achillea mongolica. Mr. G. Cottam, Alma Gardens, Hull, came second with a good collection, and Mr. J. McIntyre followed closely for third place.

Some choice blooms were arranged by Mr. Nicholas, who gained first prize for a set of stove and greenhouse flowers; Lælia purpurata, Dendrobium nobile, Eucharis amazonica, streptocarpus, amaryllis, ericas, and Ixora Williamsi were grandly shown; the second prize collection consisted almost entirely of popular orchids. Mr. M. Campbell, High Blantyre, took first prizes for two dozen show pansies, and for a similar number of fancy pansy blooms, showing handsome sets in both instances. Mr. J. Smellie, Busby, was a close second in both classes.

PELARGONIUMS.

The pelargoniums are ever a great attraction at the York show, and this season they looked as well as ever, and there was the usual combat between Mr. Eastwood, Mr. McIntosh, and Mr. Pybus. All these plants were arranged in a side tent with the fuchsias, where they made a magnificent blaze of colour, and afforded an object lesson in careful cultivation and patient training.

Mr. R. McIntosh, gardener to J. T. Hingston, Esq., Clifton, once again led the way for a group of twelve show pelargoniums, putting up a superb lot of flatly trained specimens, each a picture of high cultivation, and simply smothered with flowers; the varieties were Queen Bess, Tommy Dodd, Duchess of Bedford, Edward Perkins, Garibaldi, Miss W. Hingston, Madame Hilaire, Rose Queen, Triumphe de St. Amand, Madame Thibaut, Lady Isabella, and Kingston Beauty. Mr. Isaac Eastwood, gardener to Mrs. Tetley, Westood, Leeds, had to be content with second place, but it was a close second, and his set included grand examples of Kingston Beauty, Madame Desmoulin, Master Richard, Magpie, and Madame Hilaire. Mr. McIntosh scored again in the class for six show pelargoniums with splendid developments of Kingston Beauty, Queen Bess, Madame Hilaire, Mrs. W. Coombe, Digby Grand, and President Hanson; Mr. Eastwood followed with even larger plants of Madame Desmoulin, Kingston Beauty, Queen Bess, Painted Lady, Master Richard, and Magpie. Mr. Eastwood beat Mr. McIntosh for three specimen show pelargoniums, his Madame Desmoulin being a superb plant, covered with salmon-hued flowers.

Mr. H. Pybus, Monckton Moor, Ripon, took leading honours in the class for six double-flowered ivy-leaved pelargoniums, showing large pyramidal specimens of Madame Thibaut, Prince of Wales, Beauty of Castlehill, Ginnie Jillet, Souvenir de Chas. Turner, and Hohenzollern; Mr. Eastwood, second; and Mr. McIntosh, third. In each case the plants were more backward than usual. Mr. Eastwood had the best three double-flowered ivy-leaved pelargoniums, winning with freely-flowered examples of H. Cannell, Langson, and Boreas; Mr. H. Pybus, second; and Mr. G. Cottam, Cottingham, third.

Mr Eastwood occupied the post of honour for a dozen specimens of zonal pelargoniums, making a superb display with exceptionally grand plants of Princess of Wales, H. Cannell, Aspasia, Lady Brookes, Mrs. Gordon, Rev. J. Atkinson, Lady R. Churchill, Mulberry, Mrs. W. Paul, Dr. Orton, Divine Comedy, and John Watson; Mr. H. Pybus, of Monckton Moor, Ripon, was a very good second. Mr. Eastwood held leading place for three double zonal pelargoniums, with Empress of India, salmon; Le Cygne, white; and Cremeneaux, scarlet; Mr. H. Pybus came second, and Mr. G. Clarke, gardener to Messrs. Wharton, third. In the class for nine double-flowered zonal pelargoniums, Mr. Eastwood won the first prize with fairly large examples of Mrs. Cope, scarlet; Madame Patti, rose; Cremeneaux, bright scarlet; Dr. Jacoby, salmon; Lord Cecil, rosy scarlet; Jules Simon, pink; Clara Pfitzer, pink; Lord Mayor, purple; and Le Cygne, white; Messrs. R. Simpson and Son, Selby, second. Mr. Eastwood again led the way for three zonal or nosegay pelargoniums, showing examples of Mrs. Kelley, Henry Jacoby, and Swanley Gem, all masses of fine trusses and the flowers of a brilliant hue; Mr. H. Pybus, second, with much smaller plants. For six zonal or nosegay pelargoniums, Mr. Pybus was first, showing lovely masses of Mrs. Kelley, Salmon Queen, President Thiers, Mulberry, a fine colour; Mrs. Turner, and Circulata; Mr. Eastwood had to be content with second place in this competition, but he was first for eight fancy pelargoniums.

ROSES.

Roses were very poor throughout, and the competition was by no means keen. The trying weather is, of course, answerable for this state of affairs. Messrs. Jackson and Co., Bedale, took first prize for a group of roses, showing a fairly good set of freely-flowered bushy plants; La France and Mrs. J. Laing were notably good. Mr. H. Pybus had a much smaller collection, mostly of tea-scented varieties, and gained second prize.

In the open class for seventy-two roses, Messrs. J. and A. May, Bedale, secured the first prize with a very moderate set, in which the best blooms were of Ulrich Brunner, Gustave Piganeau, Maréchal Niel, Margaret Dickson, La France, The Bride, Caroline Testout, Jean d'Arc, Mr. J. Laing, S. M. Rodocanachi, Fisher Holmes, and Mrs. S. Crawford; Mr. G. Mount, Canterbury, came second. Mr. G. Mount led the way for forty-eight roses, his best being Madame Montel, Camille Bernardin, Cleopatra, Captain Hayward, Ulrich Brunner, General Jacqueminot, and Anna Ollivier; Messrs. J. and A. May, Bedale, second. Mr. Mount won the first prize for thirty-six blooms of roses, distinct, his Maréchal Niel, Mrs. J. Laing, Mrs. Sharman Crawford, Captain Hayward, S. M. Rodocanachi, and Marie Hoste being much the best flowers; Messrs. J. and A. May second.

Messr. J. Burrell and Co., Cambridge, led the way for two dozen roses, distinct, with very fair flowers of Horace Vernet, E. Y. Teas, Catherine Mermet, Captain Christy, A. K. Williams, Chas. Lefebvre, and Thos. Mills; Mr. G. Mount, second, and Messrs. J. and A. May, third. Mr. Mount had a very fair dozen white and yellow roses, gaining first prize with Maréchal Niel, Anna Olivier, Niphetos, Caroline Testout, Marie Van Houtte, and Perle des Jardins; Messrs. J. and A. May, second. In the class for eighteen cut roses Messrs. Burrell and Co., Cambridge, won the chief honours with fair flowers of Marie Baumann, Etienne Levet, Horace Vernet, Innocenti Pirola, Chas. Lefebvre, Ulrich Brunner, Thos. Mills, Maréchal Niel, Le Havre, Bridesmaid, Duke of Connaught, Souvenir d'un Ami, Captain Hayward, Souv. de S. A. Prince, Prince Arthur, Madame Hoste, Duke of Wellington, and Marie Van Houtte; Mr. Mount second, and Mr. W. Hutchinson, Kirby Moorside, third.

MISCELLANEOUS PLANTS.

Fuchsias made a good show along the top of the central stage in the pelargonium tent, but they were too formally trained, pyramid-shaped, to be really handsome; for half-a-dozen specimens there was a keen competition, and Mr. McIntosh took the premier award; Mr. Eastwood, second; and Mr. G. Clarke, Burton Grange, York, third. The best group of carnations was staged by Mr. Tullett, Barnard Castle Gardens, who had a pleasing collection of Souvenir de la Malmaison carnations in the centre of his exhibit, and smaller-flowered sorts at the side; this was a very pleasing display. Mr. Sunley was awarded a third prize. Table plants were fairly well shown, and Mr. C. J. Mee, Nottingham, secured first prize with an elegant set of neat azaleas, crotons, pandanus, &c.; Mr. J. R. Rollison, gardener to W. Bateman, Esq., Pannal, near Leeds, was a good second.

Mr. G. Potter, Werby, York, won the first prize for eight distinct begonias with freely-flowered specimens, chiefly single varieties, but all good sorts. Mr. G. Clarke, gardener to Miss Wharton, second; and Miss Barstow, third. Calceolarias were well shown by Mr. R. Lawson, who secured first prize with neat examples; Mr. A. Lunt, gardener to Lord Herries, Everingham Park, York, second; and Mr. W. Spavin, gardener to W. Bellerby, Esq., York, third. The best set of gloxinias came from Mr. W. Fletcher, gardener to T. M. Lambert, Esq., Beechlands, York; who was closely followed by Mr. Dobson, gardener to R. Lawson, Esq., Clifton, and Mr. Spavin. For a group of tuberous begonias, Messrs. R. Simpson and Son came first with but a moderately good collection, and Miss Wharton, York, second. Mr. J. W. Clarke, Clifton, and Miss Wharton took first and second prizes respectively for six coleus.

FLORAL ARRANGEMENTS.

The floral arrangements were good, but not so numerous as one could wish for. Messrs. Perkins and Sons, Coventry, gained the first prize for a pair of bridal bouquets, showing beautiful designs in white odontoglossums, stephanotis, &c.; Mr. G. Webster, Sunderland, second. Messrs. Perkins and Sons also won first place in the class for a pair of ball bouquets, showing elegant and brilliant displays of bright odontoglossums, Oncidium macranthum, and other graceful orchids arranged with asparagus and fern fronds. Messrs. Loughton and Sons scored for a single hand bouquet, and staged a fine design in pale colours. Messrs. Perkins and Sons led for a pair of hand bouquets, designing these with Dendrobium phalænopsis, yellow oncidiums, and rose-tinted odontoglossum spikes; Mr. G. Webster, a good second.

The best group of natural flowers arranged in a basket or stand was an arrangement by Mr. G. Webster, Sunderland, who had a most tasteful display of mauve cattleyas, blue tinted irises, gloxinias, richardias, &c., arranged with plenty of fern frondage; Mr. G. Cottam, Hull, second, with a pretty grouping of Spanish irises. The best hand basket of flowers, orchids excluded, came from Messrs. Perkins and Sons, Coventry, who had a lovely basket of golden Spanish irises and pure white, fragrant liliums; Mr. Webster second, with Spanish irises, hemerocallis and red carnations. The Messrs. Perkins added to their other prizes that of first for a hand basket of cut flowers, open, and here they had a gorgeous and tasteful arrangement of brilliant cattleyas, graceful odontoglossums, sweet lily of the valley, and fragrant stephanotis.

FRUIT.

To many a gardener the most interesting display was that produced by the competition in class 78, a class for a decorated table of ripe fruit, ten feet by four feet six inches. Not more than fourteen nor less than ten dishes of fruit were allowed, and not more than two distinct varieties of one kind. Flowers and foliage had to be arranged in glass epergnes, and by the exhibitor or a *bonâ fide* assistant. As regards the judging, the judges had instructions to take into consideration quality of fruits and plants, beauty of flowers and foliage, harmonious blending of colours, and general arrangement for effect. The whole table had to be judged by points, and the marks awarded placed upon each exhibit; the lists of marks had not been set out when our report was taken. The chief award fell to Mr. J. Tullett, gardener to Lord Barnard, Raby Castle, Darlington, who used odontoglossums and schizanthus to great advantage, both in epergnes and specimen glasses, amid his fine lot of fruit. He showed Black Hamburgh and Muscat of Alexandria grapes, Brown Turkey figs, Royal Sovereign and James Veitch strawberries, bananas, two melons, Downton nectarines, good peaches, and very fair pineapples. The second prize was won by Mr. Goodacre, gardener to the Earl of Harrington, who used Cattleya Mossiæ, odontoglossums, especially O. cirrhosum, tastefully, with asparagus and smilax sprays; especially fine dishes of fruit were Royal Sovereign strawberries, Lord Napier nectarines, Black Tartarian cherries, Muscat of Alexandria and Black Hamburgh grapes, and the Crawford peach. The third prize was won by Mr. J. McIndoe, gardener to Sir J. W. Pease, Bart., M.P., Hutton Hall, Guisborough, who had two vases of odontoglossum, oncidium, and heuchera spikes, with trailing sprays of selaginella and asparagus; the fruit was of high quality, including Muscat of Alexandria and Black Hamburgh grapes, Bellegarde and Dymond peaches, Early Rivers and Stanwick Elruge nectarines, red and yellow dessert tomatos, a pair of fine melons, Brown Turkey figs, and The Czar plums.

Mr. McIndoe showed a good collection of six kinds of fruit, winning with treble clusters of Foster's seedling and Black Hamburgh grapes, Stanwick Elruge nectarines, Bellegard peaches, Brown Turkey figs, and a seedling melon. Mr. McIndoe was the only exhibitor in this class. Mr. McIndoe was also the foremost exhibitor of four kinds of fruit, winning first prize in close competition, and staging good bunches of Black Hamburgh grapes, Stanwick Elruge nectarines, Brown Turkey figs, and Scarlet Premier Melon. The second prize fell to Mr. J. Easter, gardener to Lord St. Oswald, Nostell Priory, Wakefield, who showed Madresfield Court Grapes in good condition, and Rivers York peaches, Lord Napier nectarines, and Early Favourite melon; Mr. Goodacre, Elvaston Castle, third, and Mr. B. Ashton, gardener to the Earl of Lathom, Ormskirk, fourth.

There were eight stands of three bunches of Black Hamburgh grapes, and on the whole they were good clusters. Mr. J. Johnson, Wharfedale Nursery, Boston Spa, was first with nicely finished bunches of fair size; Mr. J. P. Leadbetter, gardener to A. Wilson, Esq., Tranby Croft, second; and Mr. J. Tullett, third. Mr. Tullett, gardener to Lord Barnard, Raby Castle, was awarded first prize for white grapes, winning with three large bunches of Foster's Seedling; Mr. W. Nichols, gardener to the Right Hon. Lady Beaumont, Carlton Towers, York, second, with finely coloured Buckland Sweetwater; Mr. G. Wilson, gardener to Sir J. Reckitt, Bart., Brough, third, with Foster's Seedling. For half a dozen peaches Mr. A. Alderman, gardener to J. D. Ellis, Esq., J.P., Worksop, secured first prize with Hale's Early, finely coloured; the second prize was secured by Mr. J. Easter, gardener to Lord St. Oswald, Wakefield; Mr. J. Wallace, Keele Hall, Staffs, third, with Bellegard. Mr. A. F. Pike, gardener to C. H. Wilson, Esq., Warter Priory, Pocklington, won chief honours for a dish of nectarines with very good specimens of Lord Napier; Mr. Goodacre came second; and Mr. C. Slade, gardener to the Duke of Newcastle, Clumber, Notts, third, with Lord Napier.

Quite a quantity of melons were shown, Mr. McIndoe and Mr. Goodacre coming first and second for scarlet fleshed varieties, the latter staging Read's Scarlet, and the former a seedling. Mr. Ashton, gardener to the Earl of Lathom, Ormskirk, had the best green fleshed melon, in Royal Jubilee, a big fruit; he also won second place with a seedling. Mr. Slade scored for a white-fleshed melon with Favourite; Mr. Steadman, gardener to Colonel Thorpe, Newark-on-Trent, second. Mr. A. F. Pike, Pocklington, showed the best figs, his Brown Turkey leading, out of eight competitors; Messrs. Leadbetter and J. Wallis were second and third respectively.

The two competing dishes of strawberries were very fine, and here Mr. A. Alderman, Sparken House Gardens, Worksop, was first with good fruits of Royal Sovereign; and Mr. G. A. Keywood, gardener to W. H. Battie-Wrightson, Esq., Doncaster, second with the same variety. Out of six competitors, Mr. C. [illegible] was first for tomatos, staging a splendid dish of fruits of Perfection; Mr. A. H. Hall second, and Mr. W. Nicholls third with Frogmore selected.

VEGETABLES.

The chief award for a collection of vegetables was well won by Mr. J. McIndoe, Hutton Hall Gardens, with a grand lot of produce: the [illegible] and [illegible] rowfat peas, Magnum Bonum dwarf beans, Long White marrows, and [illegible] cucumbers were first rate. Mr. J. W. Clark, Clifton, was third. In addition to winning first prize in the class provided by Messrs. Sutton and Sons, as already shown, Mr. J. McIndoe won the chief award in the class for six kinds of vegetables provided by Messrs. Webb and Sons, Stourbridge, also showing a grand lot of produce here.

NON-COMPETITIVE EXHIBITS.

The tradesmen of the country nobly supported the committee of the York Gala by turning out in large numbers, and putting up splendid non-competitive displays of various kinds. Orchids, caladiums, hardy trees and shrubs, and cut hardy flowers were all staged in grand condition.

Messrs. Fisher, Son, and Sibray, Handsworth, Sheffield, occupied a space of about nine hundred square feet, putting up a splendid display of various kinds of stock, and arranging their exhibit in three sections. Near the entrance to the tent there was a lovely bank of choice varieties of rhododendons put up in a most tasteful and natural style. Next followed a charming group of hardy trees and shrubs, chiefly Japanese maples in variety, cornus of sorts, purple oak (Quercus robur purpurea), standard and bush ivies, one, a golden form named Hedera spectabilis aurea, being especially grand in colour and habit; euonymuses, choice and new lilacs, and golden elder helped to make this section most attractive; it was altogether a very choice collection of beautiful plants. The third group from Handsworth consisted of choice stove plants, and the nepenthes were remarkably fine for the season of the year, especially the plants of N. Burkei, N. mixta, N. Curtisi, and N. Mastersiana, the latter in three varieties. Anthuriums were good, so also were the crotons, especially the new variety Her Majesty. Rare plants in this goodly collection were Dracæna Veitchi variegata, a splendid specimen, possibly the finest of its kind; Aralia pulchra, a bold plant with glazed, elegant foliage; tall palms, heliconias, &c., completed a fine display.

A very large exhibit came from Messrs. J. Veitch and Sons, Chelsea, and it was chiefly composed of the splendid specimen caladiums that attracted so much attention at the recent Temple show; other subjects of note were Richardia Elliottiana, the Gratus and other hybrid streptocarpus, crotons, dracænas, Leea amabilis, and other choice flowering and foliage plants. The caladiums were superbly shown, finely grown, and highly coloured. A notable plant in the Veitchian group was a splendid dracæna named Exquisite, notable for its highly-coloured and elegant foliage. Messrs. W. Cutbush and Son, Highgate, put up one of their characteristic and artistic groups of Malmaison and other carnations, arranging these with pontic and mollis azaleas, Lilium Harrisi, Erica Cavendishi, crassulas, and Hydrangea paniculata. It was a lovely group put up in a most pleasing manner, with miniature hills and vales.

Messrs. J. Peed and Son, Roupell Park Nurseries, Norwood, S.E., showed a beautiful group of well-coloured and well-grown caladiums; this was an especially bright group, and included examples of their new seedlings, W. E. Gladstone, rose and cream; and Solfarino, greenish cream and light veins. Other notable sorts were Princess Royal, Lady Mosley, Silver Cloud, Ibis Rouge, Oriflamme, Comtesse de Perousse, and Madame Koechlin. This firm also set up a very bright group of tuberous begonias, both double and single forms, representing a carefully selected strain of high quality. Carnations, gloxinias of very high quality, and streptocarpuses in variety, also came from Norwood in fine condition. The Messrs. Sutton and Sons, Reading, had a very extensive display of their specialities, showing a first-rate collection of peas, tomatos, and gloxinias, all represented by large specimens in pots, the two former being heavily fruited, and very handsome in appearance. Among the heavily cropped peas we noted The Sutton Forcing, Perfection, Early Giant, very fine; Excelsior, and Sutton's Seedling, as especially noteworthy. The tomatos were grown on single stems, two stems, or three stems, and trained in a variety of shapes so as to show off to the best advantage the ample racemes of Sutton's Abundance, Sutton's Prince of Wales, Peachblow, Sunbeam, Sutton's Dessert, Eclipse, and Best of All. The gloxinias were grand, some of them five inches across; Her Majesty, Duke of York, and Duchess of York were famous sorts. Messrs. R. Smith and Co., of Worcester, put up a bank of hardy flowers in great variety, arranging these with graceful bamboos, liliums, and a few of their unique specimen clematis; irises and pyrethrums were a feature, and a few roses contributed much to the general effect. Messrs. Dickson, Chester, arranged a table of cut hardy flowers, putting up fine sheaves in a most tasteful manner with due regard to colour effect. Crowding was avoided, and it was possible to distinguish the various fine poppies, irises, pyrethrums, ixias, hemerocallis, liliums, sparaxis, pæonies, &c. The Spanish iris were splendidly put up, so also was the new yellow carnations, Duchess Consuelo, and the comparatively rare Gerbera Jamesoni. Messrs. W. Clibran and Sons, Altrincham, put up a collection of cut hardy flowers together with a few ferns and small greenhouse plants. Pansies occupied the foreground, and were far too closely crammed together to be pleasingly effective. Messrs. Jarman and Co., Chard, exhibited pyrethrums, aquilegias, liliums, spiræas, poppies, irises, rhododendrons, and roses in good condition, making an effective display. Ferns were pleasingly exhibited by Messrs. W. and J. Birkenhead, Sale, Manchester, this firm staging a remarkably comprehensive collection of stove, greenhouse, and hardy species and varieties; adiantums were exceptionally well represented, so also were the pleasing selaginellas, elk's horn ferns, lygodiums, aspleniums, nephrolepis, &c. The plants were all small but very well grown and extremely beautiful. Mr. R. Sydenham, Birmingham, showed some pretty silvered utensils suitable for filling with flowers for table and other decorations; carnations and sweet peas were used.

A superb group of orchids was arranged by Messrs. Hugh, Low, and Co., Bush Hill Park, Enfield; the cattleyas were superb, especially the forms of C. Mossiæ, C. Reineckiana, C. Wagneri, C. Mendeli, &c. Cypripediums in variety, Oncidium macranthum, Lælia purpurata, L. grandis tenebrosa, select forms of Odontoglossum crispum, the lovely Cattleya Mossiæ Arnoldiana with pure white sepals and petals, and the albino Cypripedium Lawrancianum Hyeanum were splendidly represented in this handsome and large collection. Messrs. J. Veitch and Sons had a group of choice orchids, showing Lælia purpurata in fine condition, L. tenebrosa, Lælio-cattleya Hippolyta, Cattleya Mossiæ Reineckiana superba, Lælio-cattleya Eudora Langleyensis, L.-c. Cahbamiana superba, Cypripedium Curtisi in fine form; the rare Vanda cristata superba, with green and crimson flowers, Epiphronitis Veitchi, Trichopilia suavis alba, and Cattleya Shilleriana with six flowers on a spike. Messrs. B. S. Williams and Son, Holloway, N., sent a pretty group of orchids and foliage plants; the odontoglossums were specially good, the arching spikes making an elegant display. Oncidium macranthum, thunias, and some finely-grown vandas were included; and with the orchids were associated flowering plants of Schubertia grandiflora, and Malmaison carnations.

A big group of new and rare plants was contributed by Messrs. F. Sander and Co., St. Albans, who showed magnificent specimens of Dracæna Sanderiana, the graceful D. Godseffiana, the novel-tasselled Acalypha Sanderi, the variegated A. Godseffiana, Dracæna Van der Bilti, in the way of D. Doucetti, but even more elegant; and Rex begonias in great variety. Orchids were associated with these plants, chiefly Lælia tenebrosa, Phaius tuberculosus, Dendrobium Deari, Oncidium St. Legerianum, Lælia purpurata, and cattleyas in variety. Mr. M. Campbell, High Blantyre, N.B., showed a really fine exhibit of fancy and show pansies of high merit, together with a large and varied collection of violas arranged in sprays. Mr. S. Mortimer, Rowledge, Farnham, Surrey, staged some remarkably fine cucumbers, both sorts shown being seedlings from Improved Telegraph. Mr. G. Yeld, Clifton Cottage, York, sent some beautiful seedling hemerocallis, including Apricot, a very pleasing form, free, and with large apricot yellow flowers.

ANSWERS TO CORRESPONDENTS

Editorial communications should be addressed to the Editor of the GARDENERS' MAGAZINE, 148 and 149, Aldersgate Street, E.C.

The Editor will be glad to receive photographs of gardens, plants, flowers, trees, fruits, &c., for reproduction in the GARDENERS' MAGAZINE. He will also be greatly obliged by correspondents sending early intimation of interesting local events relating to horticulture. In sending newspapers containing matter to which they wish to draw attention, correspondents are requested to distinctly mark the paragraph.

Specimens of plants, flowers, and fruits for naming or opinion should be sent to the Editor of the GARDENERS' MAGAZINE, "Endsleigh," Priory Park, Kew, Surrey, and as early in the week as possible. All parcels must be sufficiently prepaid.

Secretaries of horticultural societies are invited to send early notification of forthcoming exhibitions and meetings, and are requested to advise us concerning change of dates

Golden Leaved Trees and Shrubs.—A. F., Aberystwyth: A few of the best golden-foliaged trees and shrubs are the Golden Elder, Golden Oak, Golden Laburnum, Golden Privet, Golden Catalpa, Golden Acacia, Golden Poplar, Golden Elm, and Golden Currant. Then, of course, there are hollies ivies, weigelas, cornus, &c., with foliage of a more or less bright golden hue.

Standard Mignonette.—R. H. P., Durham: To produce standard specimens of the mignonette it is necessary to train up a single specimen to a height of two feet, and then pinch out the growing point to cause lateral growth; when the new shoots commence to grow they must be reduced to three or four near the apex, and all others be removed entirely. Pinching must again be resorted to, to obtain a neat and full head; and as soon as this is gained, then the specimen may be allowed to flower.

A Curious Chinese Fruit.—W. A., Oxford: The fruit sent is a shrivelled specimen of the Lychee, Litchi, or Leechee. The plant that yields this fruit is Nephelium Litchi, an evergreen, sapindaceous tree, native of China, and capable of cultivation in our hothouses. The imported fruits come from India and China, and though they form a novel addition to the dessert, they do not equal the fresh produce, for the gummy pulp surrounding the seed has shrunk considerably during transport. When fresh, the fruit is about the size of a small walnut.

Knol-kohl or Kohl-rabi.—E. A. L., Bury St. Edmunds: The present is a good time to plant Kohl-rabi, or the turnip-stemmed cabbage (*Brassica caulo-rapa*). Seed should have been sown in March, at the same time as the bulk of winter green stuffs, and the seedlings should now be ready for transplanting. The plants should be set out about three feet apart each way, and should be planted so as to leave the larger portion of the stem above the ground. The crop is readily eaten by cows and sheep, indeed, they prefer it to cabbage or turnips; it is also a heavy crop, two pounds of seed being sufficient to furnish an acre of land and provide fifteen to twenty tons of bulb-like stems that keep as soundly as swedes. Hares and rabbits are very fond of Kohl-rabi, and if they abound will soon destroy a crop. The smaller specimens are very good for table use when well and properly cooked.

Crow-berries.—C. B., Berwick: The crow-berry is an Empetrum, and the popular name includes all members of the small genus. The plants are hardy, dwarf, and evergreen; spreading heath-like over comparatively moist places and bearing small wholesome and palatable berries. In the north, the Empetrums, and especially E. nigrum and its variety scoticum, are valuable for providing food for grouse and ptarmigan, the former eating the berries, and the latter feeding upon the leafage during winter. Propagation is effected either by means of seeds or cuttings; seeds should be sown either in spring or autumn; they take a long time to germinate, often remaining under the soil for a whole year. Cuttings can be taken during the summer, and should be inserted in fine sandy peat under a hand-light. The crow-berries like plenty of moisture, but not stagnant moisture, and they succeed best on damp peat beds.

Myosotis dissitiflora.—D. D. S., Winchester: The best time to sow seed of this forget-me-not is as soon as it is quite ripe. Cut the flower stems from the best plants as soon as it is seen the seed is almost ripe; lay these on a sheet of paper and place in a greenhouse, frame, or sunny window, where ripening will soon take place. Sow the seed on a piece of rich and finely-worked soil, taking care to keep it regularly moist, when seedlings will appear in a fortnight. If the weather be very hot and the seed bed exposed it will be a good plan to stretch a piece of canvas a few inches above the surface to prevent rapid drying. So far as possible you should follow out this plan, transplanting the seedlings into nursery beds as soon as large enough. Another plan is to carefully lift the best plants when preparing for summer bedding and transplant these upon a rich border where shade and moisture is afforded; here the seeds will ripen, and falling out will sow themselves; a slight stirring of the surface soil as soon as the seeds have ripened will suffice to cover the seed, and germination will soon take place.

Principles of Manuring.—W. B. F., Herts: There is no great difficulty in obtaining a clear idea of the principles of manuring; but before fertilisers can be applied with the highest degree of success, some experience in their use and close observation of the effects of the applications made for the various crops are necessary. The most important functions of manures is, as so well stated by Professor Gilchrist, of the University Extension College, Reading, to supply plant food necessary for the growth of crops, and deficient in the soil. In many cases manures improve the physical and mechanical condition and the texture of the soils to which they are applied. Thus lime, when applied to sour land, decomposes and renders harmless the sour organic acids, whose presence in the soil is the cause of the sour or acid condition of the land. When farmyard manure is applied to land the texture and physical condition of the soil is much improved by the organic matter of which this manure is largely composed. Manures may act on plant food already present in the soil, convert it into such a condition that it can be absorbed by the roots and plants. The manurial value of lime is due principally to the action of this manure on the food of plants already present in the soil. The necessary constituents of plant food generally deficient in soils are nitrogen, phosphoric acid, and potash. Nitrogen occurs in manures as: nitrates, as in nitrate of soda; ammonia salts, as in sulphate of ammonia; and organic nitrogen, as in dried blood and rape meal. Nitrogen as nitrates is immediately available as plant food; nitrogen as ammonia salts soon becomes available; nitrogen as organic nitrogen is much more slowly available. Phosphoric acid combined with lime is generally present in manures as: insoluble phosphate of lime, as in bone meal and basic slag; and soluable phosphate of lime, as in superphosphates and dissolved bones. Insoluble phosphate of lime is converted into soluble or superphosphate by treating it with sulphuric acid. Soluble phosphates are generally more active than insoluable phosphates in promoting plant food. Potash is the valuable ingredient in kainit, sulphate of potash, and muriate of potash. Potash has generally a better effect on light than on heavy soils. Artificial manures should be purchased on a guaranteed analysis, and the source from which their fertilising ingredients are derived should be stated. This latter precaution is especially necessary in purchasing bone or mixed manures. In order to be able to compare the relative values and cost of different manures, the purchaser should receive from the seller a statement giving the percentages of any valuable ingredients the manure contains. The percentage of nitrogen in a manure should be stated in its equivalent of ammonia, that of insoluble phosphoric acid as phosphate of lime, and soluable phosphoric acid as phosphate of lime, and that of potash salts in their equivalent in potash.

Names of Plants.—Under this heading we can only undertake to name species and specific varieties of plants, and not florists' flowers. Specimens should be packed in stout boxes with damp moss or leaves as packing material to ensure their reaching us in a fresh state. It is essential that flowers must accompany specimens of flowering plants, that fern fronds be fertile, and that the numbers be legible and firmly attached to the specimens. We cannot promise to name more than six specimens at one time from any one correspondent.

A. E. M., Uttoxeter: 1, Amelanchier canadensis; 2, Berberis stenophylla.

F. E. D., Reading: 1, Papaver bracteatum; 2, Oxytropis cærulea; 3, Tropæolum tricolorum; 4, Marsilea quadrifoliata.

L. H., Normanton: 1, Clematis coccinea; 2, Campanula glomerata; 3, Philadelphus coronarius; 4, Phillyrea spinosa.

R. O. W., Gloucester: 1, Combretum purpureum; 2, Leschenaultia biloba major; 3, a very poor Lælia purpurata.

H. C., Gravesend: 1, Silene orientalis; 2, Heuchera sanguinea; 3, Genista hispanica; 4, Aquilegia glandulosa.

W. L., King's Lynn: 1, Asplenium biforme; 2, Nephrolepis Duffi; 3, Nothochlæna sinuata; 4, Gymnogramma Alstoni.

The Fruit Bloom and Fruit Prospects.—There is such a very wide disparity generally between the bloom promise on fruit trees and the fruit now seen, that I hope it may be possible for some clear conclusions to be arrived at as to the causes of this disparity, when fruit returns are furnished. That we rush hastily to conclusions as to the cause, I have no doubt. It is very desirable, too, that the conclusions should generally be unanimous. Last year there were great anticipations that were falsified by results. By some it was, as usual, attributed to the spring frosts, by others to the demoralising influence of the previous heavy autumn rains on the flower-buds, and some gave other reasons. I should like to see some attention given to the probable influence of an excessive bloom on fruit production, also whether anyone did in the early spring experiment by pulling off one-half the bloom from a tree, to see what the effect would be, and stating what that result was. Most certainly there is on every hand great disappointment. There will be a fair crop of apples, but not at all a heavy one, which may, after all, be a good thing. Pears will be a very light crop, and plums very much lighter; indeed, in many cases there are none. Cherries set heavily, but many fruits have fallen. Still of these there should be a fair crop, Morellos, indeed being a heavy one. Gooseberries are very plentiful and cheap. Red currants fair, and black currants the same, but aphis is terribly prevalent. It is odd that with a season of moisture we should have aphis infesting everything, everywhere. We ought to have a grand strawberry crop, and no doubt shall now that only a very few blooms were injured by the frost. I hope we may obtain from contributors of keen observation the most practical reasons for the causes that have led to such a moderate fruit crop following such a wonderfully profuse bloom.—A. D.

An Effective Insecticide.—Many experimenters have tried to obtain paraffin in solution, and such substances as carbolic acid, turpentine, resin, and benzine have been used for this purpose. They have all failed, however, either on the score of expense, or more decidedly through the separation of the ingredients on the dilution of the liquid. Mr. Hubert H. Couzens, M.A., of the South-Eastern College, Wye, Kent, states that he has tested all known modifications of these materials, besides many others not mentioned, and, as the outcome of his investigations, alighted upon naphthaline as the key to the preparation of a solution of paraffin. To protect the invention from being exploited by outside manufacturers, it was patented by Mr. Couzens; and any resident in Kent or Surrey who wishes to prepare this wash, can secure working instructions on application to him, provided they send a stamped envelope for reply. Naphthaline is really purified "salts of creosote" or "creosote crystals." It dissolves in soap and in paraffin as well, and thus enables soap to dissolve paraffin even when highly diluted with water. The dissolved napthaline also ballasts the minute globules of undissolved paraffin, and by increasing their intensity retards, and, in fact, absolutely prevents any separation of oil from the liquid. The proportion of paraffin to soap should not exceed twenty five per cent., while the naphthaline should form about six per cent. of the final product. In the case of very hard water, it is necessary to reduce the proportion of paraffin, or else to add more soap to the wash before it is applied. The first essential for success with this wash is lathering power. Unless the liquid lathers freely, it will not wet the insects, but "beads" off. At a strength of thirteen pounds per hundred gallons of ordinary water, this liquid will kill all the ordinary sucking insects met with in this country, and the cost is about 1s. 2d. per hundred gallons of wash. Mr. Couzens states that he has used it for three years on hops, fruit trees, and roses with great success, and has abandoned quassia and all other forms of paraffin washes, and uses this substance alone. An ordinary labourer can make enough of the mixture in a couple of hours to yield 4,000 to 10,000 gallons of wash. On one occasion, with the help of two men, enough was made in a few hours for 40,000 gallons of wash. As the product will keep for thirteen months or more if stored in tubs or firkins, and readily dissolves in cold water, it is described as doing away with all necessity for the use of boilers during the busy season, and the wash is always ready to hand in a concentrated form.

THE BEST GUIDE to the garden for the whole year is the "Gardening Year Book," containing practical articles on the cultivation of Flowers, Fruit, Vegetables, &c. Price 1s. 'Gardeners' Magazine" Office, 4, Ave Maria Lane, London.—[ADVT.]

MARKETS.

Covent Garden.

FRUIT and vegetables are now plentiful, and with a good demand prices are moderate. Strawberries are cheapening fast, so also are cherries and apricots. The cut flower trade continues good, and supplies are not over abundant for the season of the year.

FRUIT.—Tasmanian apples, 8s. to 15s. per case; English grapes, 2s. to 3s.; Channel Islands, 1s. 6d. to 2s.; Belgian, 10d. to 1s. 6d. per lb.; pineapples, 2s. 6d. to 5s. each; bananas, 6s. to 10s. per bunch; English tomatos, 6d to 8d.; Jersey, 5d. to 6d. per lb.; Canary, 10d. to 1s. 4d. per tray, 3s. to 4s. per case; French cherries, 9d. to 1s. per box, 2s. to 3s. 6d. per square, 4s. 6d. to 8s. 6d. per half-sieve; apricots, 6d. to 1s. per box; peaches, 4s. to 12s. per dozen; lemons, 8s. to 16s.; oranges, 12s. to 25s. per case; strawberries, 1s. 6d. to 3s. 6d. per gallon basket; gooseberries, 3s. to 4s. per half-sieve.

FLOWERS.—Arums, 3s. to 4s.; carnations, 1s. to 3s.; eucharis, 3s. to 4s.; gardenias, 1s. to 3s.; Lilium Harrisi, 3s. to 4s.; tea roses, 6d. to 1s.; pink roses, 3s. to 6s.; red roses, 2s. to 4s.; cattleyas, 6s. to 9s.; Odontoglossum crispum, 1s. 6d. to 4s.; and tuberoses, 1s. to 1s. 6d. per dozen blooms; Adiantum cuneatum, 4s. to 8s.; marguerites, 2s. to 4s.; mignonette, 2s. to 4s.; pelargoniums (scarlet), 4s. to 6s.; violets, 9d. to 3s. 6d. per dozen bunches; azaleas, 6d. to 9d.; stephanotis, 2s. to 3s.; lily of the valley, 6d. to 1s.; white gladiolus, 6d. to 9d; and pelargoniums, 4d. to 6d. per dozen sprays; bouvardias, 6d. to 8d.; white lilac, 3s. to 4s. per bunch.

VEGETABLES.—Asparagus, 9d. to 4s. per bundle; endive, 1s. 3d. to 1s. 6d.; lettuce, 6d. to 9d.; cos, 1s. 6d. to 2s.; cucumbers, 2s. to 4s.; cauliflowers, 1s. to 2s. per dozen; mint, 2s. to 3s.; new carrots, 4s. to 5s.; turnips, 5s. to 6s.; parsley, 1s. 3d. to 1s. 6d. per dozen bunches; Egyptian onions, 6s. to 7s. per cwt; English spring, 1s. 6d. to 2s. 6d. per dozen bunches; green peas, 6s. to 8s. per bushel; French beans, 3d. to 4d. per lb.; mushrooms, 6s. to 8s.; eschallots, 2s. to 2s. 6d. per 12 lb.; rhubarb, 1s. 6d. to 2s. 6d.; radishes, 6d. to 9d. per dozen bundles; broccoli, 4s. to 6s. per crate; spinach, 1s. 6d. to 2s. per bushel; Canary potatos, 9s. to 12s.; Malta rounds, 8s. to 10s.; Jersey, 13s. to 15s. per cwt.; Lisbon rounds, 5s. per box.

Borough Potato Market.

There is a good trade in new potatos, and owing to increasing supplies prices have fallen. There is still a fair demand for old potatos. Dunbars, 130s.; Scotch Magnums, 120s.; Bruce, Main-crops, Sutton's Regents, Reading Giants, and Saxons, 110s. per ton; Belgians and Germans, 4s. 6d. to 5s. 3d. per bag. New—Maltese rounds, 6s.; Teneriffe kidneys, 6s. to 7s.; St. Malo, 8s.; Jerseys, 8s. 6d. to 9s. 6d.; Cherbourg Flukes, 8s. to 8s. 6d.; ditto, Kidneys, 7s. 6d. per cwt.; Lisbon rounds, 3s. 6d. to 4s. per box.

The mean reading of the Barometer during the week at Greenwich was 29·85 inches, and that of the Thermometer 60°·2, the latter being 2°·0 above the week's average in the 50 years 1841—90. The direction of the wind was variable, the horizontal movement of the air being 5 per cent. below the week's average in the 16 years 1860—75. The duration of registered bright sunshine in the week was 41·1 hours. The measured rainfall amounted to 0·32 of an inch.

ENGAGEMENTS FOR THE ENSUING WEEK.

MEETINGS.

MONDAY, JUNE 20.—Royal Agricultural Society's Show at Birmingham, four days. Oxfordshire Horticultural Society.

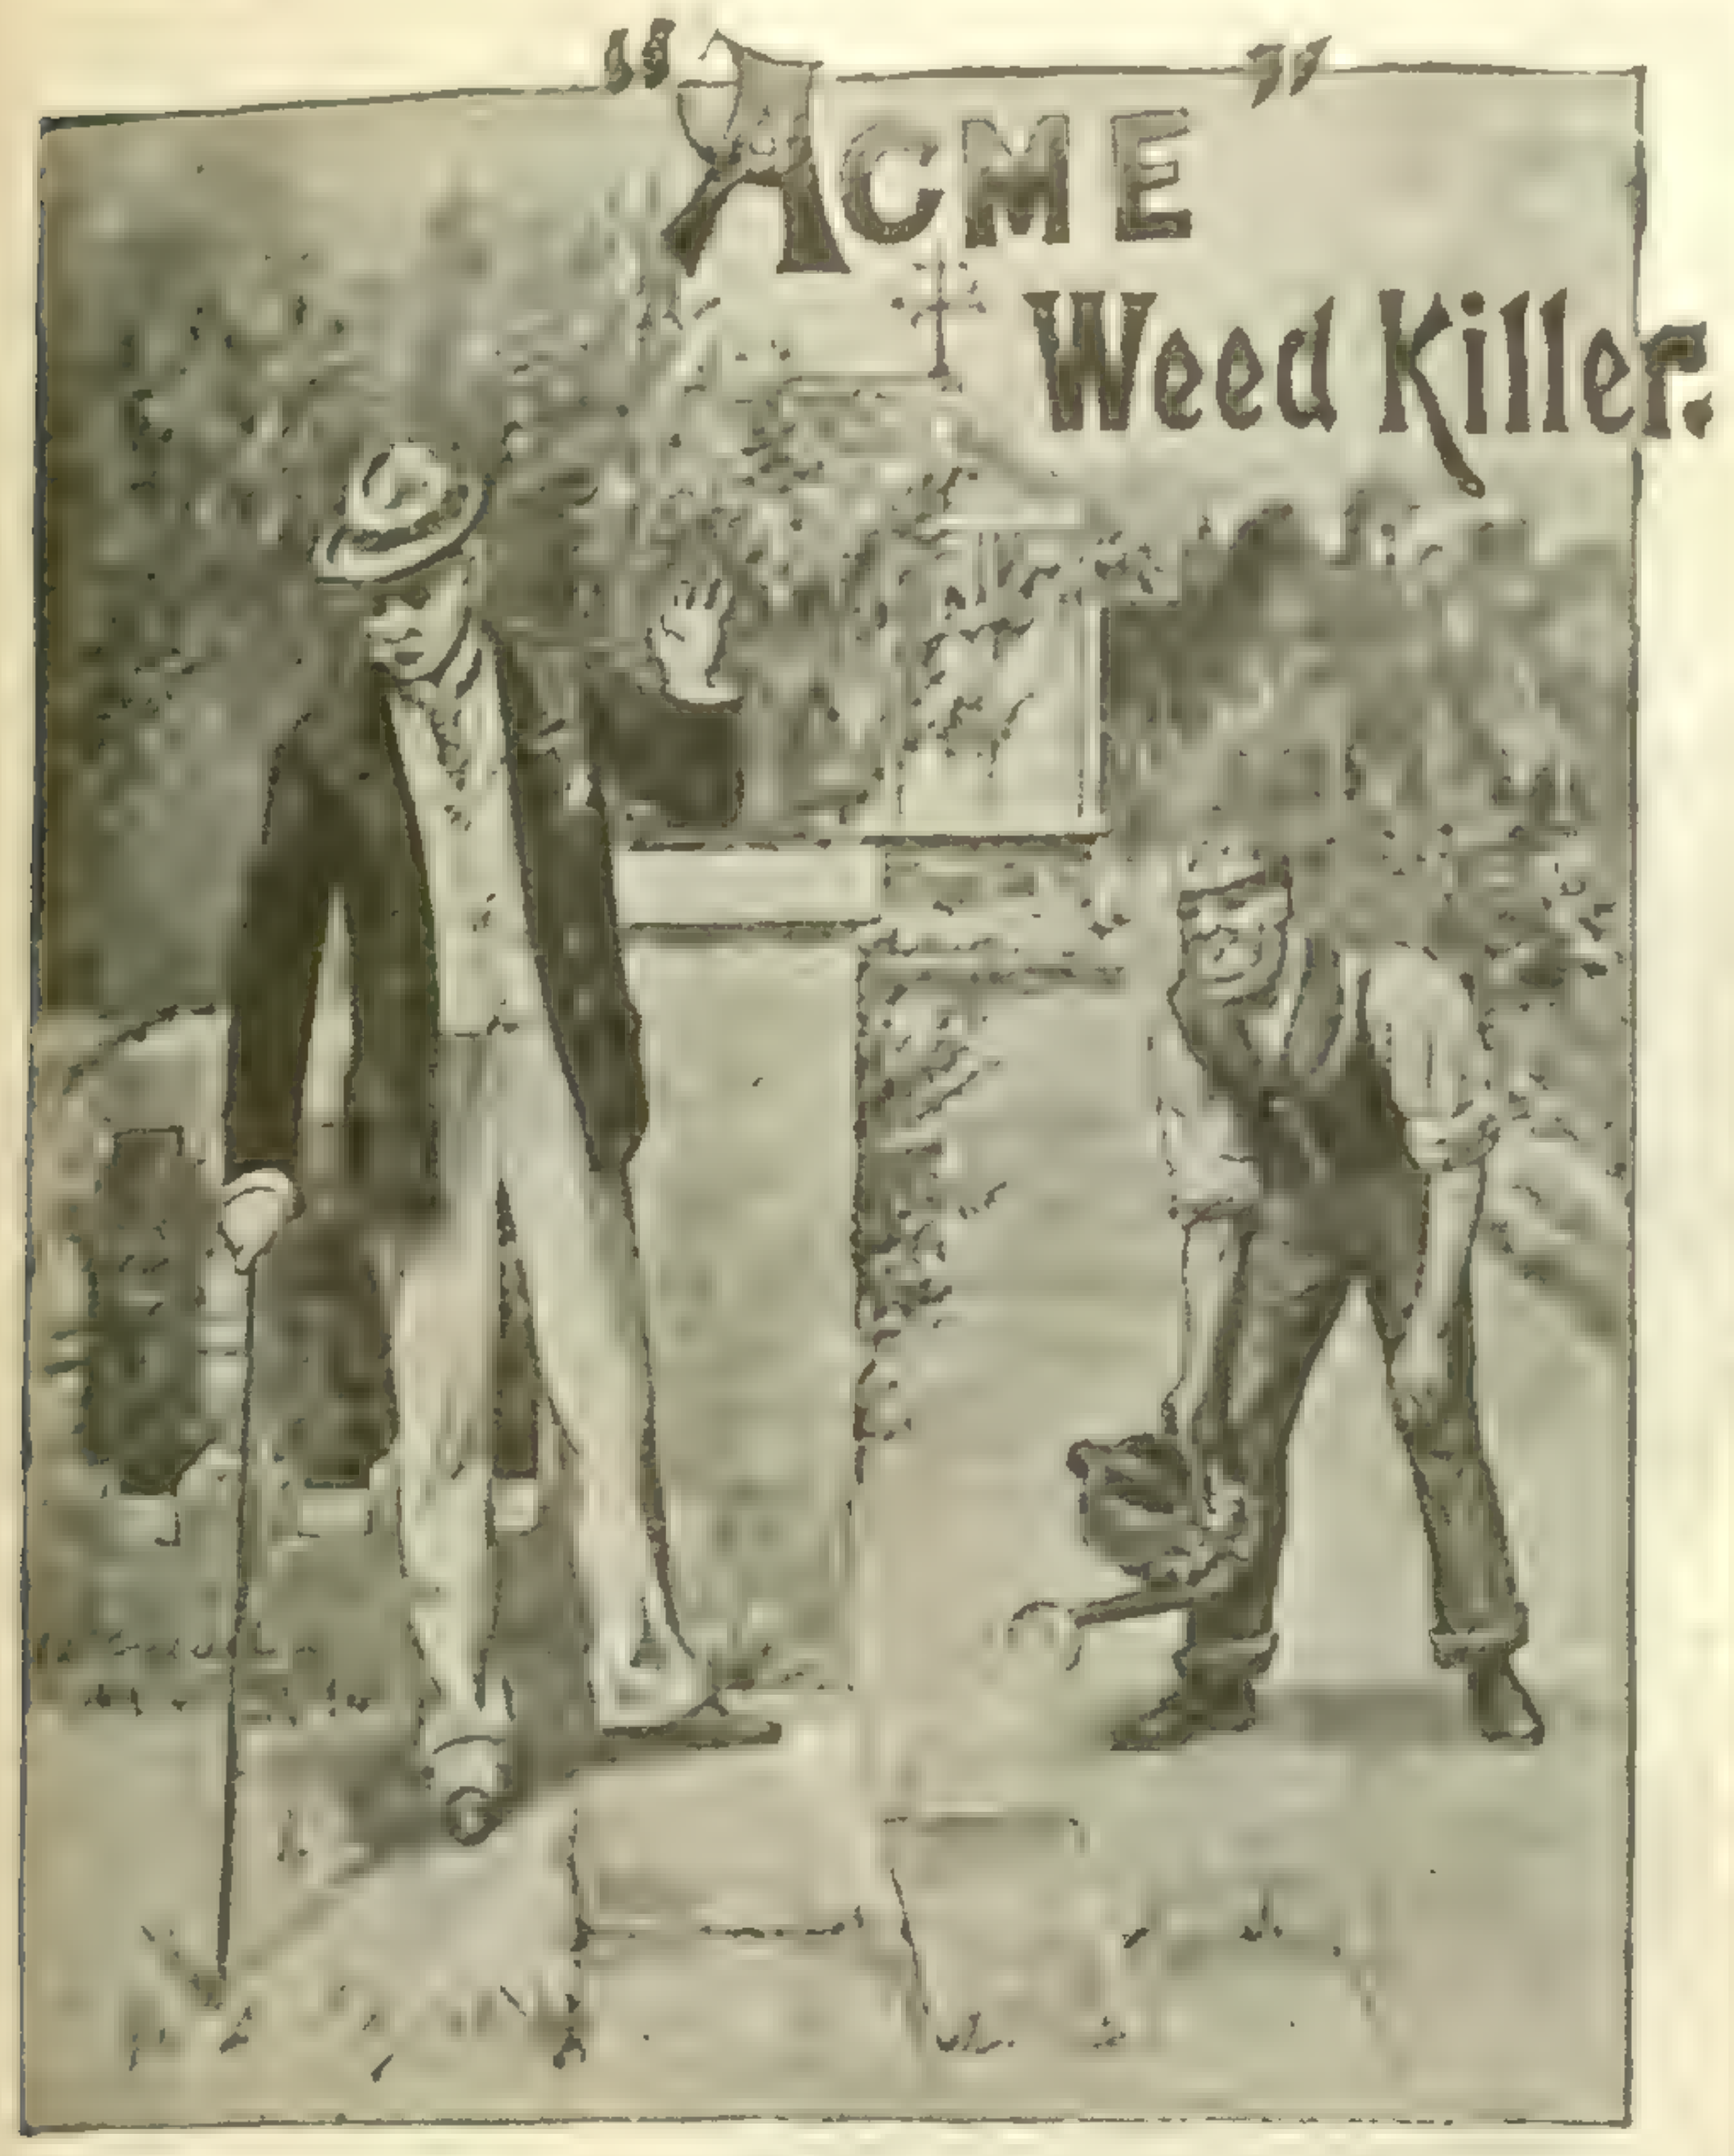
IS BRITISH SPORT DYING OUT? has often been a [illegible] very satisfactory to know that a negative answer can be given. [illegible] Englishmen has improved during the past half century, and the [illegible] is attributed to the better style of living which has been [illegible] temperate, both in eating and drinking, and, above all, the system [illegible] purified by medicines of sterling worth, such as Holloway's Pills and Ointment. [illegible] sport will never die while people use these remedies, which will cure [illegible] give strength in place of weakness.—[ADVT.]



"Acme" Weed Killer.

"Weeds, weeds, everywhere. I wonder if that new gardener can suggest anything."

"Yes, Sir, I'm just using the 'Acme' Weed Killer. The best thing in the world for killing weeds."

Used in the Crystal Palace Grounds,
The Royal Horticultural Society's Gardens,
AND IN THE
Principal Gardens of the United Kingdom.

STRENGTH, 1 in 25. One Gall. to 25 Galls. of Water.

DOUBLE STRENGTH. One Gall. to 50 Galls. ot Water.

For sizes and prices send for Price List.

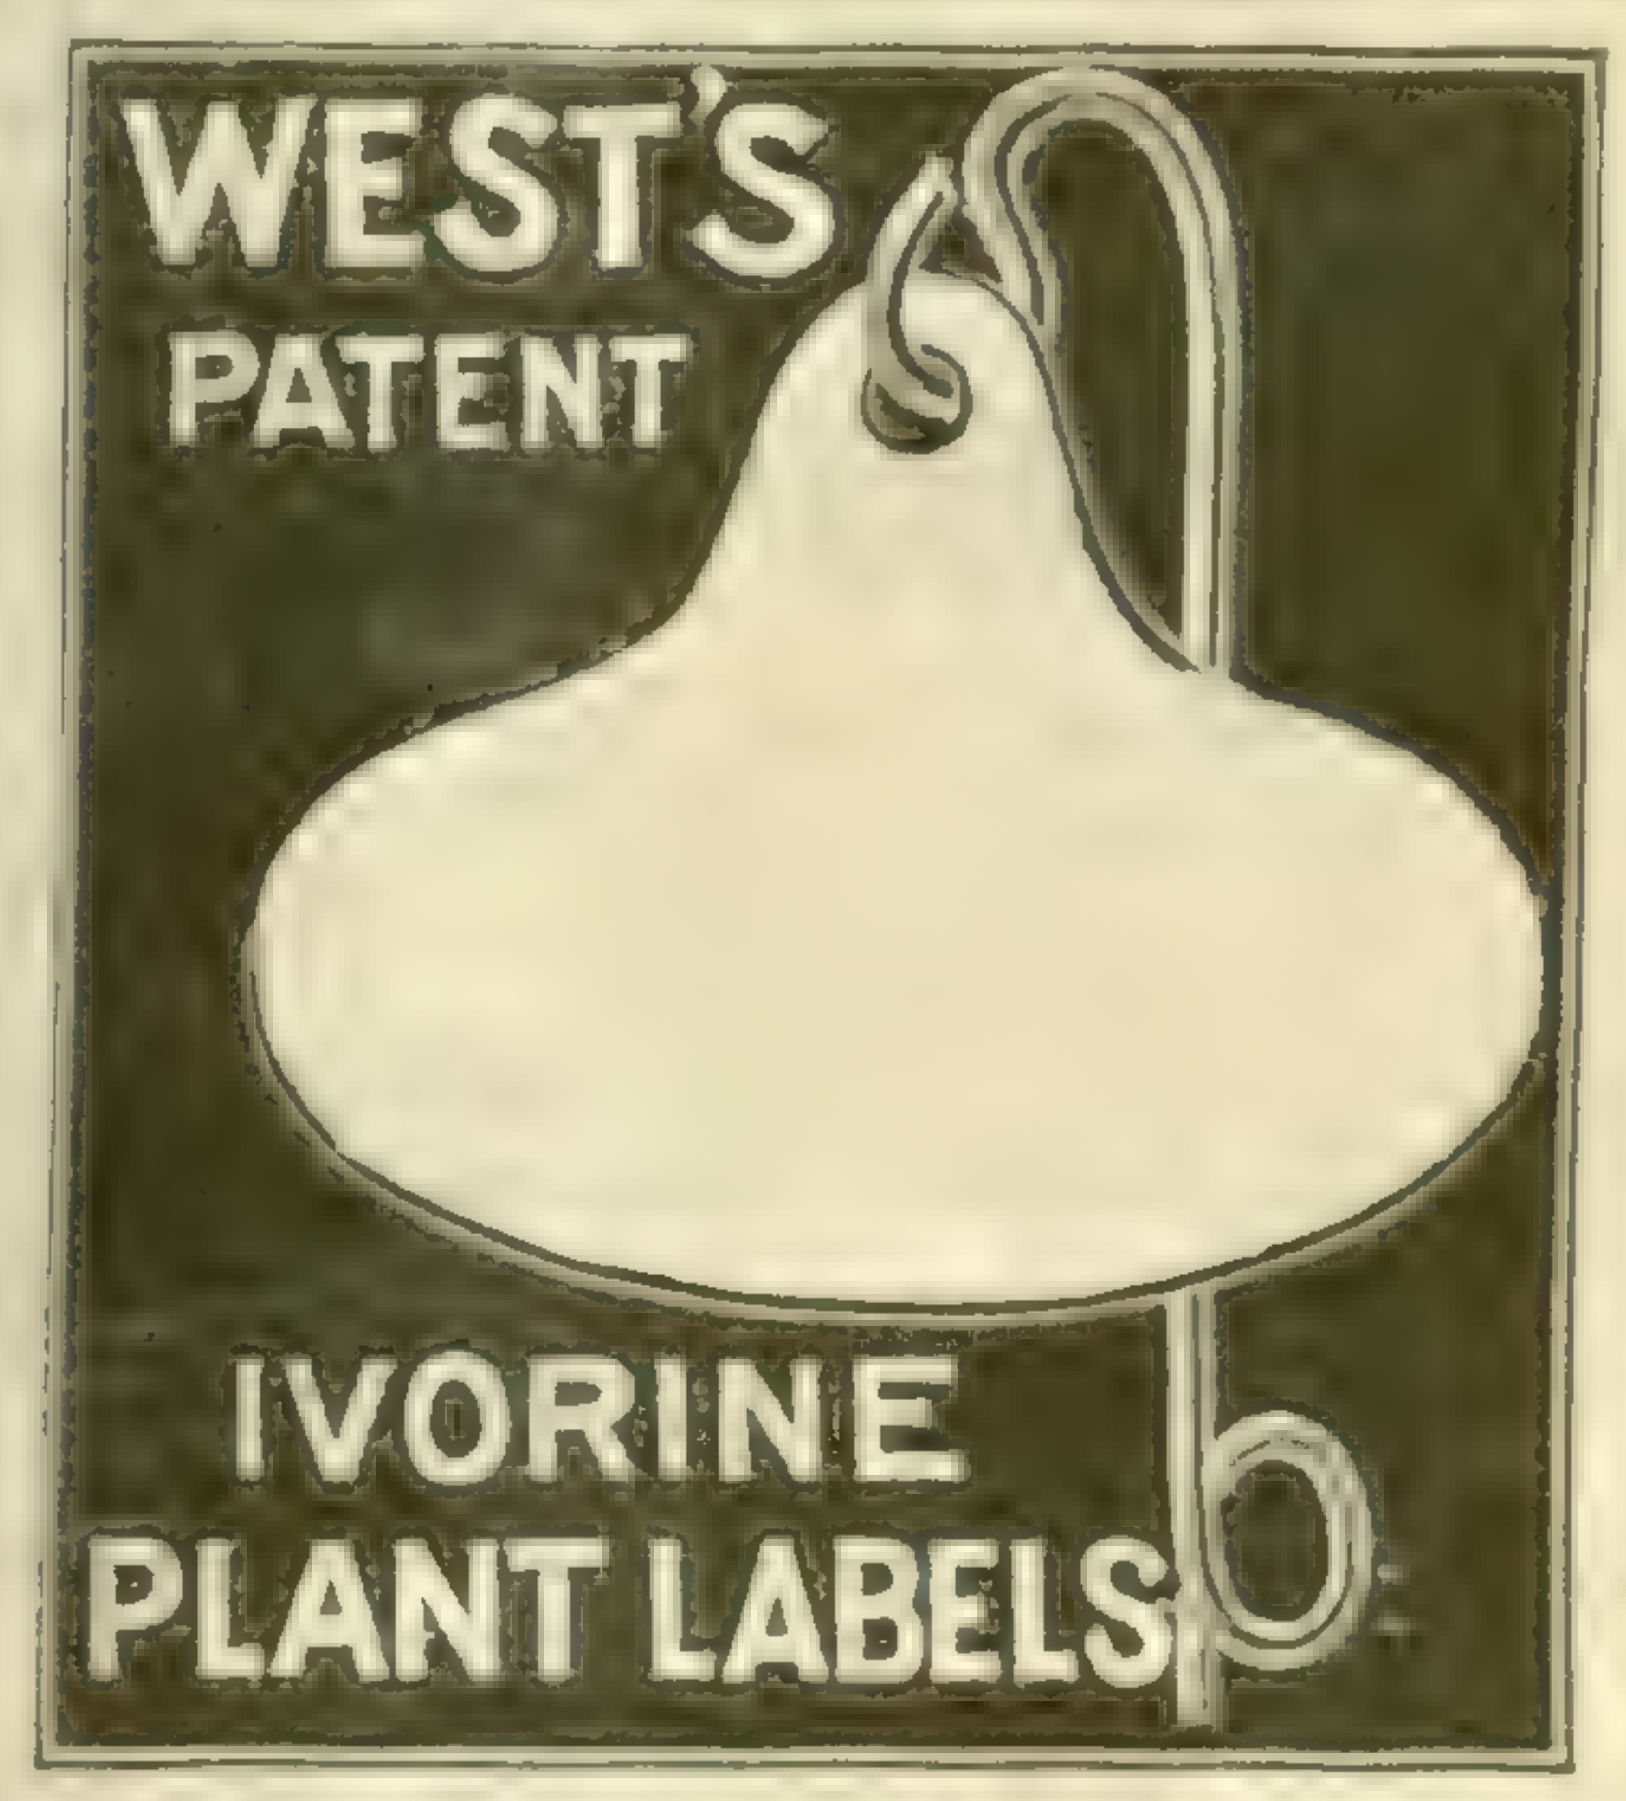
R. HALLIDAY & CO.,
ROYAL HORTICULTURAL WORKS,
MIDDLETON, MANCHESTER.



THE "IVORINE" WRITING DISC, being made of a Selluloid and Xylonite composition, is imperishable, and does not corrode or eat away, like wood and metal labels; and being ivory-white, when written upon it shows to perfection. And also, as the writing is on the Ivorine itself it is permanent, though washable, and does not become unreadable like all other labels, for hitherto all labels have been painted, as the paint gets old. It is for labelling every description of goods when used with or without the wires, and will last a century, either in a greenhouse, in a wine cellar, or out in a garden, and not only is it always ready for use, and may be written on both sides, but the name when written in pencil may be easily rubbed off, and so used as many times as desired.

Samples and Lists of the West's Patent Specialities post free. Price, **9d.** per dozen; **8s.** per gross, complete; **7s.** per gross without wires, Carriage Paid. Size a little larger than illustration, and wires 2 ins. longer from loop. (See List for other sizes). Special ink, if required, in **6d.** bottles, per post.

Supplied by all Nurserymen, Florists, &c.

EPPS'S COCOAINE.
COCOA-NIB EXTRACT.

The choicest roasted nibs (broken-up beans) of the natural Cocoa on being subjected to powerful hydraulic pressure, give forth their excess of oil, leaving for use a finely-flavoured powder—"Cocoaine," a product which, when prepared with boiling water, has the consistence of tea, of which it is now, with many, beneficially taking the place. Its active principle being a gentle nerve stimulant, supplies the needed energy without unduly exciting the system. Sold only in labelled Tins. If unable to obtain it of your tradesman, a tin will be sent post free for 9 stamps.

PRACTICAL LANDSCAPE GARDENING and ESTATE DEVELOPMENT CO.

This Company undertakes to advise as to the laying out of gardens, the general improvement of landed property, and the development of building estates; to provide plans and estimates, and, for a fixed sum, to carry out all work incidental to the making of the smallest Villa garden as well as to the designing and execution of the most extended estate improvements.

It has a staff of experienced foremen, and all necessary plant.

No charge whatever is made for plans, which, however, remain the property of the Company unless the work is carried out by it.

All communications to be addressed to—

ESTATE DEVELOPMENT CO.,

NATIVE GUANO.

BEST AND CHEAPEST MANURE FOR GARDEN USE.

Price **£3 10s.** per ton in bags. Lots under 10 cwt., **4s.** per cwt., 1 cwt. sample bag sent carriage paid to any station in England on receipt of P.O. for **5s.**

Extracts from 22nd annual collection of reports:—

NATIVE GUANO FOR POTATOS, VEGETABLES, &c.

C. H. TINDALL, Bardney: "Used for Potatos. Result very satisfactory; yield much above average. A splendid manure." G. WATTS and SONS, Bournemouth, report: "Good for general purposes. Grand for all Root Crops, Tomatos, and Cucumbers. Find it so cheap; and it does not exhaust the ground like other manures."

NATIVE GUANO FOR FRUIT, ROSES, TOMATOS, &c.

E. F. USHER, Sidcup: "Potatos and carrots, splendid crops Peaches, Nectarines, &c., splendid. Should not like to be without it on any consideration." G. STONARD, Gardener to Sir A. T. Watson, Bart.: "Used for seven years for Peaches, Grapes, Tomatos, Cucumbers, Roses, and Chrysanthemums with excellent results."

Orders to the **Native Guano Co. (Limited)**, 29, New Bridge Street, Blackfriars, London, where pamphlets of testimonials, &c., may be obtained. Agents Wanted.

RUSTIC ADORNMENTS
FOR
HOMES OF TASTE.

BY THE LATE SHIRLEY HIBBERD.

New and Revised Edition by the Editor of AMATEUR GARDENING.

"This new and revised edition maintains its position as something more than an ordinary amateur's guide; it is a practical work brought up to date so as to keep abreast of fashion and taste as displayed in the floral decorations of the table, the home, and the garden. This work would make a useful present to anyone."—*The Bazaar, the Exchange and Mart.*

"We cannot imagine a more appropriate presentation book than this to persons who delight in flower and attractive home surroundings. It is worthy a place in any 'home of taste.' It abounds in useful practical hints, and is eminently readable from end to end."—*Journal of Horticulture.*

NOTES OF THE WEEK.

MULCHING.

IN the important paper on weather influences on farm and garden crops which Mr. E. Mawley, the secretary of the Royal Meteorological Society, contributed to the quarterly journal of that body, the author gives some interesting particulars of the droughts that have been experienced during the current century, and of the value of mulching with suitable materials in mitigating their injurious effects upon growing crops. Different crops, it is pointed out, vary considerably as to their powers of enduring a long continuance of dry weather, and this power depends, as a general rule, upon the nature and depth of their roots. For meteorological purposes, Mr. Symons' definition of "absolute" and "partial" droughts have, in Mr. Mawley's opinion, proved most useful, but from a horticultural point of view they are likely to be misleading. When the ground has become dry on the surface and to the depth of several inches, a fall of a tenth of an inch of rain once a week, which would soon bring to an end a partial drought, would prove of no service to vegetation generally beyond temporarily cooling and moistening the air. On certain soils it would do more harm than good by beating down the surface, and thus tending to increase evaporation from it afterwards. In proof of this Mr. Mawley cites the fact that at Rothamsted during the drought of 1870, which extended from April to July, it was found that the mixed herbage of meadow land suffered much more than the crops in arable land, of which the surface between the rows had been stirred one or more times with the hoe. In the garden the crops are less at the mercy of dry weather than on the farm, for even in the case of a porous soil much may be done either by thorough waterings, mulching, or the frequent use of the hoe, to enable them to withstand a long period of dry weather, a liberal mulching being in the majority of cases the most useful. A few years since Mr. Mawley carried out an interesting experiment in order to ascertain the effect of mulching with half-rotted manure upon the moisture and temperature of the soil beneath the covering. Two percolation gauges, each three feet square and three feet deep, were used in conducting the experiment, and these were filled with soil of a light and porous nature. The soil in one gauge was covered to a depth of three inches with half-decayed manure, and the surface of the soil in the other was left uncovered. Once a week the mulching was loosened with a fork, and the soil in the other gauge was hoed to the depth of about an inch. Mr. Mawley has compiled a table showing the effect of the mulching or percolation, evaporation, and temperature, and taking the five months commencing with April and ending with August, when the growth of plants is most active, we learn from this table that the mulched soil remained more uniformly moist than the unmulched; and that it was also more equable in temperature, being slightly warmer at night and decidedly cooler during the daytime. There were sixty-eight days during the five months when no measurable quantity of rain passed through the unmulched soil, but on no occasion did percolation cease in the case of the mulched soil. During the twelve months the percolation in the case of the latter exceeded that of the unmulched by 1·67 inches, while the evaporation was 1.67 inches less. There are, in Mr. Mawley's opinion, two important points to be borne in mind as to the application of mulching, one being, not to put it on in any case earlier than May, as it keep the ground cold at a time when the stimulative effects of warmth are most needed, and the other, that it should not be so deep or close in texture as to exclude the air from the roots of the plants round which it is placed. The investigations that have been made by Mr. Mawley amply confirm the views held by experienced cultivators and are of much interest for the light they throw upon this simple but important detail of garden management.

EVOLUTIONARY JUMPS.

IN looking round our present abundant wealth of floral beauty, both of flowers and foliage, our immense variety of fruits and vegetables, and even our decorative trees and shrubs, we seldom realise the immense debt we owe to Nature in the shape of those sudden inventive freaks which we term "sports." Every individual creation has some peculiarities of its own which distinguish it from its fellows, and, besides the dissimilarity of general external appearance or minor differences of detail, there are a myriad unseen constitutional variations which also play a material part in that "survival of the fittest" which has shaped all living things into their present forms. The selective cultivator, with his keen eye, can do much by picking out, generation after generation, these minor peculiarities, and, by breeding on from them, can add them together to great effect; but, nevertheless, his work would fall far short of the results obtained, both in originality of conception and in extent of effect, did not Nature (by which we mean the underlying creative and shaping power of all life) step in, and at a "jump" present him with altogether new types, as well as with much advanced forms of known ones, and so afford him new starting-points, and inspire fresh ideals for future realisation. In many cases man himself, in these later days, has done much to induce these "jumps" by crossing or hybridising plants which, though of different species, are yet sufficiently akin to combine and form fertile flowers. By doing this a sort of conflict is set up within the combined organism between the diverse, though conformed, parental elements. The result of this is that in the offspring the normal stability of both species is upset, and now one and now the other ancestral form obtains the mastery to a certain extent, the varying degrees of predominance affording all sorts of variant forms, of which the breeder avails himself. In such alliances colour becomes a potent factor, and a remarkable instance to the point was seen in the clematis section of the Temple Show, where the influence of C. coccinea had been infused into other species with larger and more open flowers with delightful effect. In the tuberous begonias we see another grand result of similar work carried much farther, and in the orchids some really marvellous combinations have been effected, the mingled features of the parents' flowers affording a most interesting study to the connoisseur. This sort of sportive instability is, however, somewhat apart from our subject of perfectly natural sports, to which, so far as we can ascertain, no particular inducement exists. In this connection ferns may especially be cited, as a very large number of beautiful sports have been found growing quite wild, and of such widely different types from the common as the selective breeder could not obtain by many generations of culture. In this direction the Temple Show afforded a rare example of a natural sport of this class occurring under culture in the case of Phlebodium Mayi, a beautiful plumose form of P. glaucum. This species has been raised probably by the million for trade purposes, but has hitherto remained perfectly stable; at last, however, precisely as our native species of Polypodium (a near relative) has given us the plumose Welsh form (P. v. cambricum), this exotic jumps at a bound into a form precisely akin, though its greater size and robustness will, of course, give it a far grander character, surpassing even that triumph of hybridism, P. Schneideri, in which the same or a closely-allied fern was mingled with another natural English sport, and so imbued with precisely the same characteristics. Here in P. Mayi the only selection was the picking out of the young plants from the rest of the batch when its merits became obvious, Nature at one "jump" having achieved a perfect form, and left the grower nothing to do but rear his prize with the tender care it merits.

DINNER TABLE DECORATIONS.

In its relation to the decoration of the dinner table with flowers, public taste has undergone many changes during the thirty or forty years that have elapsed since arrangements of cut flowers first obtained recognition at horticultural exhibitions, and within proper limits, a continuous change in methods of arrangement is desirable. No one could wish to sit down to a table daily that is from one end of the year to the other decorated in precisely the same way as far as the flowers available in the respective seasons will permit, and therefore changes become a necessity; but to comply with the canons of taste the modifications must be kept within certain limits and consequently be free from extravagances, both in the matter of quantities and the selection of colours. Unfortunately for the peace of mind of those who are imbued with sufficient artistic perception to be able to fully appreciate taste when displayed in the arrangement of cut flowers, the limits within which changes and modifications may be successfully made are not generally observed. Fashion is proverbially fickle, and nothing without being extravagant; consequently the eye is frequently offended by unpleasant contrasts, or by a superabundance or a poverty of flowers. At one time we see the table so crowded with flowers as to suggest that it existed simply for the purpose of displaying the largest possible number of cut flowers, and to greatly interfere with the comfort of the guests. At another time the table is so sparingly furnished with flowers as to render it somewhat difficult to appreciate the fact that an attempt had been made to decorate it. Some of the most remarkable tables of the latter type that have yet come under our notice were contributed to the exhibition of the Colchester Horticultural Society, at which decorated dinner tables receive, with other floral arrangements, special encouragement. Two classes were provided for dinner tables, and as each one contained a considerable number of entries the tables should have produced a tasteful display, but, arranged on either side of the tent, they appeared to the visitor on entering to be little beyond a spread of white tablecloth. On a close inspection being made, it could be seen that they had flowers upon them, but, with few exceptions, they were so few as to almost reach the vanishing point. We have no sympathy with those who endeavour to convert the dinner table into a parterre, and we have times out of number protested against the use of large receptacles, and excessive crowding in any form. On the other hand, we are strongly of the opinion that sufficient flowers should be used on dress occasions to produce a somewhat rich as well as a decidedly tasteful effect. To strip the garden of flowers each time the table is decorated is as unnecessary as it is undesirable; but something more than a small handful of flowers and foliage is required to justify an eight feet table being regarded as "tastefully arranged."

The Rose Number of the Gardeners' Magazine will be published on July 9, and be rich in matters of interest to rosarians. In its preparation we have been fortunate in obtaining the co-operation of the Rev. J. H. Pemberton, Mr. E. Mawley, Dr. Shackleton, Mr. A. W. Paul, the Rev. G. E. Jeans, Mr. W. F. Cooling, Mr. C. J. Grahame, Mr. G. L. Paul, Mr. J. T. Simpson, Mr. G. Mount, Mr. W. J. Tutcher, Mr. G. H. Mackereth, and other rosarians. The issue will be fully illustrated in black and white, and with it will be presented a finely-executed coloured plate of the beautiful new China rose Queen Mab. As in previous years, there will be no increase in the price of our Rose Number, and those of our readers who desire extra copies should, to avoid disappointment, advise their newsagents well in advance of the date of publication.

Plant Diseases.—At the recent meeting of R.H.S. Scientific Committee, Mr. Worthington G. Smith reported as follows on the specimens that had been submitted to him: From a further specimen of palania disease I have confirmed my previous opinion. The latest specimen sent bore the fructification of a fungus which I hope to have identified. The diseased tissues contain abundant mycelium, and the starting point for attack was from last year's old wood. I shall be glad to communicate further results later. From the material sent by Mr. Caddy it was difficult to say really what was the cause of the begonia disease. One or more fungi were easily developed on the withering leaves, but whether these were saprophytic on the dying tissue or were the cause of trouble, it is not safe to say. Begonias of this class are so liable to wither at the margins (from draughts, &c.), and are so unsuitable for transit to a distance, that accurate observation can only be made on plants in their actual habitat. The plants of biota sent by Messrs. Hillier were attacked by Pestalozzia funerea, Desm., a fungus well known to occur on dying Thuyas and allies. The life-history is, however, imperfect. At the same meeting specimens of the "silver-leaf" disease were received from Mrs. Floyer, Basingstoke. The disease is known to be very common on pomaceous plants, the silvery appearance being due to the raising of the epidermis from the underlying tissue. The disease is very fatal, both indoors and out, and is in all probability attributable to the growth of a fungus, the nature of which has not yet been ascertained. Some apple leaves injured by frost or scald from the effect of the sun shining on a damp surface were also sent.

Guide to Kew Gardens.—The remarkable success achieved by Mrs. Goldney's work on the poetical aspects of the Royal Gardens, Kew, has induced that accomplished lady to edit an illustrated guide to these gardens especially adapted to the requirements of those who are hardly in a position to "appreciate the more learned guide books issued by the authorities." As so well stated in the preface, "Among the thousands who visit the Royal Gardens every year there are many who look upon them as pleasure grounds and nothing more. They admire and delight in their beauty; they enjoy the magnificent flowers; they luxuriate in the fresh air and lovely scenery, but their interest in botany as a science, is no greater than their knowledge of it," and for the assistance of this section of the visitors the guide, which is admirable in every detail, has been compiled. In the preparation of the guide Mrs. Goldney has had the advantage of the assistance of the Rev. S. Goldney, M.A., who has long been a resident at Kew, and devoted special attention to the historical aspects of the village and its world-renowned gardens, and the sketch he has written of the history of the gardens is of special interest. The guide is illustrated by about forty exquisite reproductions chiefly of the more picturesque aspects of the gardens, and these alone are well worth the shilling charged. The publishers are Messrs. Dawbarn and Ward, 6, Farringdon Avenue, E.C.

The Production of Grapes in Almeria decreased from 1893 to 1896 at the rate of about 100,000 barrels per year, and from the 800,000 to 900,000 barrels produced for market during the years 1890-1-2-3 the quantity was reduced to 562,000 barrels in 1896. In a recent report Vice-Consul Lindsay states that when the season of 1897 commenced it was feared that the decrease would continue, not only on account of the ravages of the phylloxera, but also because during the months of May and June a quantity of the fruit was lost through hailstorms. Fortunately, in spite of these calamities, the production increased by 96,429 barrels over 1896, and it now appears as if the 100,000 barrels lost yearly during the period of diminution will be gained, as vines planted then are now beginning to bear fruit. In the grounds attacked by the phylloxera, the Riperia in its several varieties is producing very good results, and a considerable number of American vines, grafted on the native stock, are yielding fruit. Large sums are yearly expended in acquiring and opening up ground for new plantations, thus providing work for a large number of hands, as quantities of blasting powder are used in demolishing the banks of stone which cover the soil. Exportation to Liverpool, London, Glasgow, Bristol, and Hamburg has increased; on the other hand, New York, Hull, St. Petersburg, and Christiania have been less favoured, doubtless due to the bad condition of the fruit, which in general was wanting in firmness. The early fruit ("uva de Casto") was sold at fair prices, and some varieties, such as Rosadas and Imperiales, have fetched from 16s. to £1 per barrel (55 lbs.), prices hitherto unheard of for this class of fruit. The true shipping grape ("uva de embarque") did not fetch more than from 10s. to £1 5s. as a general rule. There were a few sales at New York at fabulous rates, as much as 14 dol. (U.S.A. currency) having been paid per barrel. The season of 1898 is expected to be a good one, as the meteorological conditions have changed, and there is every reason to expect an abundant and well-conditioned harvest.

Cytisus Adami.—Mr. Herbert E. Brooks sent specimens of the curious Cytisus Adami to the meeting of R.H.S. Scientific Committee, which originated as a "graft hybrid," obtained by Mr. Adams as the result of budding C. purpureus on C. Laburnum in 1825. The purple and yellow flowers are those of the two species, but the brick-red is the hybrid. It was described in the *Gardeners' Chronicle*, 1841, p. 325, 336; 1842, p. 397, and often subsequently. The fullest account is in Braun's "Rejuvenescence," 1851 (English translation, 1853); in Professor Morren's paper in the *Belgique Horticole*, 1871; and a summary of the whole subject is given in Darwin's "Variation of Animals and Plants, vol. i., ed. 2 (1875), p. 413.

Destruction of Crops near Railways.—At the recent annual meeting of the Central and Associated Chambers of Agriculture an animated discussion took place upon the question of crop destruction by sparks from railway engines. Mr. Lipscombe, of Yorkshire, pointed out that formerly a farmer whose crops were injured by sparks from railway engines had a claim against the railway company; now, however, even if all his crops were spoiled by this means he could claim no compensation unless negligence on the part of the engine drivers could be proved. It was decided that the matter should be brought under consideration at the next business meeting.

The Rev. Professor G. Henslow, M.A., V.M.H., will give a lecture at the Drill Hall, Westminster, on Tuesday, June 28, in connexion with the usual fortnightly R.H.S. meeting. The lecture will be rather in the form of a demonstration, and Professor Henslow will deal with some of the most interesting plants exhibited. We may again remind our readers that the R.H.S. Rose Show which was to have been held on June 28, has been postponed until July 12.

A Botanical Station in Mexico would prove most valuable both to botanists and horticulturists. Such a station Professor J. W. Harshberger, of Philadelphia, is doing his best to persuade the authorities to institute. He suggests Las Canoas as a good locality, for it is 3,500 feet above sea level, situated in a beautiful valley, plentifully supplied with pure water, and surrounded by a luxuriant tropical flora that is as varied as it is beautiful. It is suggested that the establishment of such a station would incur no great expense, and the adjacent virgin forest would supply abundant material for botanical work for years to come.

National Chrysanthemum Society.—The annual excursion of the National Chrysanthemum Society will take place on July 25, and the programme so far as arranged comprises a visit to Harwich, travelling there and back by the Great Eastern Railway, and a water trip from Harwich along the picturesque river Orwell to Ipswich and back. Arrangements have been made with the railway company for the conveyance of the members of the party by rail and water, and for providing dinner and tea at the company's hotel at Harwich at a charge of 10s. 6d. to members and of 11s. to non-members. If a guarantee can be given for two hundred and fifty passengers a special train of saloon carriages and a saloon steamboat will be placed at the service of the party; otherwise the party will travel by ordinary trains and steamboats. Several affiliated societies have, we understand, expressed their intention of taking part in the excursion, and it has been arranged that their members shall be supplied with tickets at the same rate as members of the parent society. As it is important the executive should have some idea of the probable number forming the party by July 1, it is desirable those who intend taking part in the excursion should communicate with Mr. R. Dean, Ealing, by that date.

New Public Park at Tipton.—In connection with the proposed public park for Tipton the authorities instituted a competition, offering a first prize of £25 for the best plan for laying out the New Victoria Park. Ten competitors entered, and Messrs. W. Barron and Son, Elvaston Nurseries, Borrowash, Derby, gained the first prize for a plan that allowed for a lake of about three acres, cricket and recreation grounds, lawn tennis courts, bowling greens, band-stand, shelters, &c.; the firm also furnished plans for lodge entrance-gates, and ornamental fencing to surround a large part of the thirty-three acres. Messrs. Barron and Sons' approximate estimate of cost is £3,990. The winner of the second prize in this competition was Mr. J. Perry, architect, Tipton.

The Nursery and Seed Trades have been well represented at the Royal Agricultural Society's show at Birmingham. Messrs. James Carter and Co. exhibited large collections of garden and farm seed, and the produce grown therefrom, the display of annual and other flowers from St. Osyth being especially attractive. Messrs. Sutton and Sons contributed large collections of grasses, seeds, roots, potatos, peas, tomatos, which, arranged on their handsome stand, produced a remarkably good effect. Messrs. Webb and Sons had an attractive stand, on which flowers and vegetables were conspicuous; the new peas, Pioneer and Senator, in pots, attracting much attention. Messrs. Dicksons, Chester, and Messrs. Harrison and Sons, Leicester, with other firms, had interesting and attractive exhibits.

History of Cultivated Vegetables.—The second of the series of lectures now being given by the Rev. G. Henslow at Chiswick was devoted to a sketch of the history of cultivated vegetables. Mr. Henslow passed in rapid review the facts relating to the history of the several groups of esculents now in general cultivation, and directed attention to the conditions under which some of the more important changes had been brought about. There was again a large attendance, presided over by W. Marshall, Esq., who, in thanking Mr. Henslow for his interesting lecture, expressed the satisfaction he, in common with other members of the council of the Royal Horticultural Society, felt in the interest that was being shown in the lectures by the gardeners in the western districts of the metropolis. In consequence of the exhibition of the Richmond Horticultural Society being fixed for Wednesday next, the lecture arranged for the evening of that day has been postponed until the following week.

A Jersey Potato Competition.—With a view to testing the earliness, cropping powers, and general usefulness of the new Fidler's Queen potato in Jersey, Messrs. Fidler and Sons, Reading, instituted a competition among the Jersey growers, offering medals and money prizes for the best and heaviest dozen tubers. This competition took place a few days ago in the Lyric Hall, St. Heliers, with the result that there were thirty-six entries, representing all the varieties of soil found in the island. Dr. Powell, St. Lawrence; Mr. Le Gresley, St. Peter's; and Mr. Le Masurier, St. Peter's, were respectively the winners of gold, silver, and bronze medals; Mr. Laureas, St. Heliers, gaining a special prize. In presenting the prizes, Mr. P. Bailhache stated that those who introduced new varieties of potatos into the island deserved the thanks of the farmers, for doubtless other varieties than the Royal was to be the future potato. To keep pace with the constantly growing competition of other countries, new varieties would have to be introduced. He expressed his thorough satisfaction at seeing such fine specimens of this potato, and said that the Fidler's Queen was a potato that seemed to him to be exactly what was wanted as a seed tuber for the Jersey crops.

Direction of the Wind.—At the monthly meeting of the Royal Meteorological Society a paper was read by Mr. R. C. Mossman, F.R.S.E., in which he gave the results of an analysis of the direction of the surface winds observed during the occurrence of snow, hale, gales, thunderstorms, lightning, fog and aurora. Snow is of most frequent occurrence with north and east winds, and least common with S.W. winds. Hail showers occur most often with W., N.W., and N. winds. Gales are most frequent with W. and S. winds. The greatest number of both summer and winter thunderstorms occur with W. winds, although the values in summer are high with E., S.E., and S. winds. The greatest number of fogs are recorded on calm days closely followed by days on which the wind blew from the east.

An Early Crop of Mushrooms.—As a result of the late heavy rains, Mr. W. Henman, Manor Farm, Islip, Oxford, gathered on June 8th, fully one hundred pounds of fine mushrooms from among his standing grass, some of the specimens being thirteen inches in diameter. The crop was displayed in Mr. H. Smart's fruit shop, in the Oxford Market, and it was regarded as a somewhat unusual exhibit for the time of year.

A New Striped Rose.—Under the designation of Captain Christy panaché, a striped form of the popular hybrid tea Captain Christy, is pourtrayed in colours in *Le Jardin*. As in the case of the majority of the striped roses, it has been obtained as a bud sport and fixed in the usual way. The flowers, as shown in the coloured plate, are pale pink, marked with narrow lines of carmine, and are pleasing in appearance. The sport originated some five or six years ago in the neighbourhood of Caen, and has been introduced by M. M. Letellier et fils, of that city.

Boycotting Potato Growers.—According to a Scottish contemporary the tactics adopted by the butchers in attempting to influence auctioneers and farmers are now being tried in relation to the sale of new potatos. A circular has been sent to auctioneers and Perthshire potato growers by the Trades' Defence Association of Scotland declaring that the members of the potato trade section will not bid at any auction at which the offers of representatives of co-operative societies are accepted, or deal with any farmer who sells his potatos directly or indirectly to such societies. It is to be hoped that neither the auctioneers nor the growers will submit to this attempt to interfere with their business.

Mr. Gladstone's Favourite Flower.—Recently Mr. Ellis Lever made the suggestion that on every 19th of May, the anniversary of Mr. Gladstone's death, the English rose should be worn. On seeing Mr. Lever's suggestion Dean Hole wrote to him: "You will be pleased to read the following extract from a letter dated March 28, 1877, addressed by Mr. Gladstone to myself: 'The rose is in addition to other merits an English flower, almost an English institution, and I am glad you have made it the subject of special study and commemoration.'" We observe that Mr. Christopher Molesworth makes the absurd suggestion that the most suitable flower for commemorating the late statesman is the Monk's-hood (*Aconitum napellus*). In discussing the question he says: "What is wanted is an indigenous flower fully in season about the middle of May, and to be had from a farthing to a penny the bunch or sprig. We have such a flower in the Aconitum napellus, sacred to St. Dunstan, whose day is the 19th of May." Mr. Molesworth is obviously ignorant of the fact that the Monk's-hood does not come into bloom until quite the end of June or early in July, and that the plant is so poisonous that the merest scrap of the root is sufficient to cause the death of an adult in a few hours.

Green Shading.—In discussing the influence of coloured light upon the growth of plants at Chiswick the other day, the Rev. G. Henslow stated, as the result of experiments he had made, that green glass was the least desirable for plant structures. He also pointed out that there was exactly the same objection to green shading materials as to green glass, and he strongly advised his audience to avoid their use.

Cider and Perry were contributed to the Royal Agricultural Society's Show in larger quantities and in finer condition than in any previous year, a fact of interest as showing that these beverages are obtaining more attention as the result of the prominence we have given to orchards and their products. There were twenty-six entries of cider in cask, and the varities of apples from which the first prize cask was made comprise Kingston Black, Horner, French Jersey, Red Jersey, and Cadbury. The second prize cask is the produce of Royal Jersey, White Jersey, Chisel Jersey, and White Close Pippin. The third prize was awarded to the produce of Red Jersey, Nortons' Bitters, and Gins. All the prize casks were of Somerset make. Bottled cider of 1897 was represented by forty-four entries, and the prizes were awarded respectively to the counties of Gloucester, Somerset and Hereford. The first prize lot was made from Cowarne Red, and Fox Whelp; the third prize lot from Styre Wilding and Cowarne Red, and the second prize lot from mixed a eties. Of older bottled cider there were twenty-one entries, and the first prize was awarded to produce of Fox Whelp and Skyrme's Kernel, made in 1895. The second prize was awarded to produce of Kingstone Black, Dabinet, and Chisel Jersey, made in 1896, and the third prize to Norfolk cider made in 1896. There were twenty-one entries of perry, the first prize for which was awarded to produce of mixed fruit made in 1894, the second prize to produce of Oldfields made in 1896, and the third prize to perry of ast year's make.

A New London Garden.—The long disused burial-ground which lies at the back of the Robert Browning Hall, York Street, Walworth, was opened as a public garden the other day. The garden has been laid out under the direction of Miss Wilkinson, the landscape gardener connected with the Metropolitan Gardens Association. The association itself has contributed a portion of the cost, the major portion being given by Mr. John Newberry, of Whyteleafe, and the remainder by the Rev. J. J. Curling, vicar of Hamble.

Carnation Rust.—Some experiments have been conducted at the New York Experiment Station with a view to determine the efficiency of spraying carnations with salt water in checking the rust which in some cases is so destructive to these beautiful flowers. So far as could be ascertained the spraying with salt water did not impose the slighest check upon the disease, but the application of the salt to the soil was found to be decidedly injurious to the plants.

Fossil Forests have special attractions for those who take an interest in the vegetation of prehistoric times, and it is, therefore, not surprising to hear that a party of Swedish scientists are preparing to visit Northern Greenland for the purpose of making investigations in the fossil forest of Atanakerdluk. This wonderful spot is about 70 degress N. latitude, and is considered the most perfect remains of its kind in the world. An earlier report places the date of its origin in the Miocene period, for out of the sixty-six species of plants which have been recognised in it, no less than eigteen belong to that period. Among the trees found there are early representatives of the Sequoia gigantea of the Yosemite Valley. Another tree family flourished in this forest, viz., the Salisburia; the single modern representative of this group is Salisburia adiantifolia, a native of Northern China and widely distributed in Japan, where it is probably an introduced plant. As a fossiliferous exhibit, the forest of Atanakerdluk is unique. Many of the leaves of the trees discovered are so perfectly preserved that fragments of insects are plainly to be detected on their surface.

Pyrethrum roseum is evidently declining in popularity as an insect destroyer, for in 1896 the prices for the flowers in Montenegro, where the plant is largely grown, showed a falling-off of about seventy per cent. The produce for 1897 was only about fifteen tons, of the value of £1,800, and of this quantity ten tons were sent to Great Britain.

NEW PLANTS, FLOWERS, AND VEGETABLES.

LÆLIO-CATTLEYA HIPPOLYTA AURANTIACA.

THIS is an extremely beautiful form of a charming hybrid, one form of which was figured in our last issue. This differs from those variations already known in having the sepals and petals of a beautiful rich shade of orange; the lip is orange yellow at the base, but deepens towards the front, and is veined throughout with deep red brown. A.M., R.H.S., June 14, Messrs. J. Veitch and Sons, Chelsea.

LÆLIO-CATTLEYA CANHAMIANA SUPERBA.

An immense flowered form of a bold hybrid. It differs from the type in having larger flowers than usual, and in the rich purple colouring in the wide lip. The flowers measure nearly eight inches across, and the petals are of great breadth; these segments are of a soft lavender-purple shade. Lip very large, gold at base, with dull purple veins; apex spreading, crimson-purple at base, shading to paler purple at the apex. A.M., R.H.S., June 14. Messrs. J. Veitch and Sons.

LÆLIA PURPURATA ERNESTI.

A distinct variety of this popular orchid. It has white sepals and petals, the former being rather flatter than is generally the case. The lip is creamy white, quite yellowish in the throat; apex pale blush, with a deepening shade of rose toward the distinctly defined yellowish throat. A.M., R.H.S., June 14. Mr. Chapman, gardener to R. I. Measures, Esq., Cambridge Lodge, Camberwell.

ODONTOGLOSSUM ELEGANTIUS BARONESS SCHRODER.

A very graceful odontoglossum with branching spikes of light flowers that remind one of O. excellens. The flowers are scarcely three inches broad, segments narrow, pale sulphur yellow, with white shading at the base, and with bars and blotches of deep chocolate. Lip whitish with a large chocolate blotch. A very distinct and graceful orchid. A.M., R.H.S., June 14. Mr. W. H. White, orchid grower to Sir Trevor Lawrence, Bart., Burford Lodge, Dorking.

SCUTICARIA HADWENI.

A curious-growing orchid with upright terete foliage. The flowers are borne singly on long peduncles, and are about three inches across, very thick and fleshy. Sepals and petals yellowish-green, with heavy bars and blotches of bright brown. Lip white stained with yellow at the base, deeply hollowed or cupped, and irregularly striped and spotted with bright rose. A.M., R.H.S., June 14. Mr. W. H. Young, orchid grower to Sir Frederick Wigan, Clare Lawn, East Sheen.

CATTLEYA MOSSIÆ MADONNA.

A lovely cattleya with large flowers that have substantial and pure white petals of great breadth; sepals narrow, but pure white. Lip large, side lobes white; throat yellow, with brown and purple veins; down the centre is a broad white band that fades into the pale purple staining that occupies the centre of the front lobe; around the whole of the front lobe is a wide white band having a beautifully frilled and crimped margin. A.M., R.H.S., June 14. Messrs. Stanley-Mobbs and Ashton, Southgate.

BEGONIA MRS. F. SANDER.

A handsome Rex begonia, the large leaves having a dark green centre near the footstalk, this being surrounded by a broad and irregular zone of silvery rose, this again being surrounded by bright green. A.M., R.H.S., June 14. Messrs. F. Sander and Co., St. Albans.

CALADIUM LORD ANNESLEY.

A curious caladium with ovate lanceolate leaves, the apex being extended to a sharp point; the colour is crimson with a rosy suffusion. The centre of the leaf is very bright with a shining surface. A.M., R.H.S., June 14. Messrs. F. Sander and Co., St. Albans.

PÆONY ELLA CHRISTINE KELWAY.

A beautiful double pæony with palest pink guard petals and a full centre of blush-pink petals; a very handsome variety. A.M., R.H.S., June 14. Messrs. Kelway and Son, Langport.

PYRETHRUM LADY KILDARE.

A very pretty double pyrethrum with quilled and fringed flowers; the colour is rich pink, but the yellow tint in the tiny fringes to the florets gives the whole a charming glow. A.M., R.H.S., June 14. Messrs. Kelway and Son, Langport.

GLOXINIA GALATEA.

A handsome and distinct gloxinia, white, creamy white in the throat; the six lobes at the mouth are each surrounded by a band of bluish-purple; this band is made up of irregular spottings and veining. A.M., R.H.S., June 14. Messrs. J. Veitch and Sons, Chelsea.

PHILADELPHUS CORONARIUS MONT BLANC.

A dwarf-growing and bushy plant, eminently suitable for massing, owing to its hardiness and the profusion with which its white flowers are produced. Every little growth carries about five flowers, and as these are over an inch across, the effect of a bush can well be imagined. A.M., R.H.S., June 14. Messrs. J. Veitch and Sons, Chelsea.

MECONOPSIS CAMBRICUM PLENA.

A double form of the Welsh meconopsis, the flowers being very double, graceful, and of a rich yellow colour. A.M., R.H.S., June 14. Messrs. Paul and Son, Cheshunt.

CANNAS.

Mosaic, very broad segments of a golden hue, heavily spotted and shaded with vermilion.

Mrs. W. Marshall, this has four large, clear golden-yellow segments, with a little scarlet basal stain; the other segments are heavily spotted with scarlet. A.M., R.H.S., to each, June 14. Messrs. Paul and Son, Cheshunt.

BEGONIA COMMODORE DEWEY.

A lovely tuberous begonia, camellia-flowered, large and substantial, with broad clean petals. A handsome double form of a brilliant crimson-scarlet shade, and of velvety appearance. A.M., R.H.S., June 14. Messrs. H. Cannell and Sons, Swanley.

PYRETHRUM MONARCH.

A very fine single pyrethrum, with bright rose flowers, measuring three inches and more across; centre, deep orange; stems, tall and wiry. A.M., R.H.S., June 14. Messrs. Collins Brothers, Waterloo Road and Hampton.

CABBAGE BEACONSFIELD.

A pretty cabbage, very tender, early, and of high quality when cooked. The heart is cone-shaped and clear green in colour, firm and full. A.M., R.H.S., June 14. Mr. J. Brouse, Hallbound Gardens, Beaconsfield, Bucks.

CUCUMBER, THE KEEPER.

A handsome cucumber, slightly spiny, and with a fine bloom; of good length, and with scarcely any waste in tip or tail. This is the result of crossing Improved Telegraph with Duke of Edinburgh. A.M., R.H.S., June 14. Mr. S. Mortimer, Rowledge, Farnham.

HERBACEOUS PÆONIES.

Lady Long, a good double pink variety, of fine shape and size.

Dorothy Welsh, a handsome globular flower, of a delicate flesh-pink shade.

Alton Lock. This is a semi-double variety, of an intense marone-crimson shade.

Cardinal Vaughan, a big double form, of fine shape, and of a silvery-rose tint. F.C., R.B.S., to each, June 10. Messrs. Kelway and Son, Langport.

ONONIS ROTUNDIFOLIA.

A dwarf herbaceous plant, of compact growth, with bright green leafage, and a plenitude of pea-like flowers, pink, heavily suffused and shaded with deep carmine. B.C., R.B.S., June 10. Messrs. Kelway and Son.

VERBASCUM PANNOSUM.

This is a showy form, with a tall spike of soft canary-yellow flowers of good size. This looked like a glorified V. thapsus, with very regular spikes. B.C., R.B.S., June 10. Messrs. Kelway and Son.

POPPIES.

Papaver bracteatum Silver Queen, a pretty and large-flowered poppy, with charming silver-pink blooms.

P. bracteatum Princess of Wales, a beautiful form, with huge blooms of graceful shape and delicate rose-pink colour; the blotches at the base of the segments are blackish-purple. F.C., R.B.S., to each, June 10. Messrs. Barr and Son, Covent Garden.

CLEMATIS DUCHESS OF YORK.

One of the new and beautiful coccinea hybrids, with small tubular flowers of a lovely shade of blush-pink. This is one of the latest additions to a charming set of plants, and its flowers are so pale as to be almost white. F.C., R.B.S., June 10. Messrs. G. Jackman and Son, Woking.

PYRETHRUM CASSIOPE.

A fine, large, single flower; very distinct and handsome; soft rosy-crimson, with dull yellow centre. This has larger flowers than the majority of single forms F.C., R.B.S., June 10. Messrs. Kelway and Son.

TREE PÆONIES.

Princess of Wales, a huge bloom, nearly a foot across, and of an exquisite shade of silvery white or blush.

Duchess of Marlborough, semi-double, and somewhat cup shaped; bright salmon shaded with rose towards margin.

Prince of Wales, very bright scarlet, with a shade of red rose towards the margins, and a few striations of palest blush.

James Kelway, rosy-scarlet, with very broad thick segments. A very handsome flower.

Marchioness of Londonderry, a magnificent flower of huge size, and with massive segments of the purest white. F.C., R.B.S. to each, June 10. Messrs. Kelway and Son.

KNIPHOBIA TUCKI.

This is a bold form with dense spikes that carry scarlet flowers at the apex and yellow ones towards the base. B.C., R.B.S., June 10. Messrs. Kelway and Son.

TUBEROUS BEGONIAS.

Countess of Aberdeen, an exquisite begonia with a full flower, having broad waved and crimped petals of large size; the colour is a beautiful shade of salmon with a tinge of scarlet. A lovely flower.

Countess of Dartmouth, one of the finest of double white begonias, having immense broad petals, soft and regular, and of the purest white.

Sir W. Lockhart, a fine and heavily crimped and waved double begonia of good size, and of a deep shade of salmon-scarlet. F.C., R.B.S. to each, June 10. Messrs. J. Laing and Son, Forest Hill.

STOCK SNOWFLAKE.

A handsome Brompton stock, carrying tall spikes of fragrant and pure-white flowers, having just a tinge of green at the bases of the segments. A handsome and useful variety. F.C., R.B.S., June 10. Messrs. A. W. Young and Co., Stevenage.

AMOMUM HEMISPHÆRICUM.

A Japanese plant closely allied to the gingers; it has stems rising ten or twelve feet high bearing distichous oblong-lanceolate leaves a foot or more long by three inches in breadth. The flowers are borne in a dense globose head at the apex of a short peduncle that rises from the root-stock among the stems; they are green save for the lip, which is red-brown with a yellow margin. The bracts are shaded with red-brown, while the underside of the leaves is shaded with claret-brown. A plant was sent to Kew in 1893 by Mr. H. N. Ridley, Director of the Botanic Garden and Forest Department, Straits' Settlements, and this flowered for the first time in June, 1897, when it was a noticeable plant in the tank of the tropical water-lily house. *Bot. Mag.*, t. 7,592.

STEPHANANDRA TANAKÆ.

A hardy Japanese undershrub of slender growth; the leaves are triangular-ovate, three-lobed, bright green, golden-yellow in autumn, margins sharply serrate; the flowers are quite tiny, as in many of the closely allied spiræas, calyx yellow, corolla white; the flowers are borne in terminal pendulous [illegible] about three inches long. There are but four known species of Stephanandra, three from Japan and one from China: S. Tanakæ is from the Hakone Mountains in the Sagami province of Japan, and is a rather graceful shrub though [illegible] attractive enough to become generally popular. *Bot. Mag.*, t. 7,593.

SYMPHYANDRA WANNERI.

This is a pretty biennial, clothed with oblanceolate leaves that have [illegible] and serrate margins, and that has a leafy many-flowered terminal raceme of [illegible] violet-blue campanulate flowers. This species is a native of Transylvania, and one of seven that constitute a genus, which differs only from campanula in its anthers cohering in the tube. Symphyandra Wanneri is just becoming known to cultivators, but it has been grown at Kew for many years past, both in pots and in the open border. In pots it flowers early in the spring, and is useful for greenhouse decoration; in the open border it flowers during June. The plant attains a height of three feet when exceptionally robust, but is usually about two feet high. It is a pretty plant, with red-brown stems, and all its various parts slightly hairy. The flowers are an inch across at the mouth. *Bot Mag.*, t. 7,594.

OXFORDSHIRE ONION AND BEAN GROWERS.

It is generally admitted by those able to judge, that the soil and climate of the neighbourhood of Oxford is admirably adapted to the production of high-class vegetables, the soil being naturally dry, and entirely exempt from bogs, fens, and stagnant waters, corn and grass growing here in abundance. About Oxford the soil is various, portions more or less sandy, other parts deep and rich, and excepting the Chilterns, there are not any hills of considerable height; the remainder being gentle eminences, which vary the landscape without obstructing the tillage. Under such conditions it might reasonably be expected that cultivators, following the teaching of the GARDENERS' MAGAZINE, would be very successful in developing new forms and varieties as the rewards of painstaking cultivation, selection, or hybridisation. If we refer to the onion, we are at once reminded of the number of strains that have originated in the county, and the wonderfully improved size and finish of the White Spanish type in the hands of Mr. Taplin and other growers at Banbury, whose enthusiasm knew no bounds, and who brought onion cultivation within the province of the fine arts, the Banbury type undoubtedly serving as the basis of the under-mentioned forms, viz.: Nuneham Park, sent out by Mr. Stewart, Nuneham Park Gardens; Anglo-Spanish, a strong-growing bulb raised by Mr. G. Neal, Bampton; Rousham Park Hero, sent out by Mr. H. Wingrove, Rousham Park Gardens; Walker's Exhibition, selected by Mr. J. Walker, Thame; Banbury Cross, a sturdy grower, sent out by Mr. H. Boxold, Banbury; not to mention The Lord Keeper, The Wroxton, and other developments raised at the Wroxton Abbey Gardens, which form part of the group known as Deverill's Pedigree Onions.

MR. J. GREEN'S EXCELSIOR RUNNER-BEANS, AT OLD HEADINGTON.

All the foregoing onions have been referred to, time and again, in these pages, but very little has appeared, in recent years, in relation to the many fine forms of runner beans, which of late have nearly doubled their length of pod and number of seeds. All the experts in the county have exhibited their selections at the Royal Oxfordshire Horticultural Society's shows, professionals, amateurs, and cottagers running each other close in size and quality. Of gardeners, the following are and have been growers of runner beans, each of whom follow out much the same course of cultivation, and, as a matter of fact, claims to have his own selected strain. Among these I may name Mr. G. Neal, The Gardens, Bampton; Mr. H. Wingrove, Rousham Park Gardens; Mr. John Baker, Bampton; Mr. Richard Wadham, The Grange Gardens, Steeple Aston; Mr. A. E. Kirtland, Bletchington Rectory Gardens; Mr. A. G. Nichols, recently of Nuneham Park Gardens; and Mr. James Holton, Worcester College Gardens, Oxford. With reference to Mr. Neal, he raised in 1864 Ne Plus Ultra, a standard variety, but did not put it into commerce till 1879, he having secured no less than six certificates of merit, including one at the R.H.S. Vegetable Conference in 1889. Ne Plus Ultra has been largely grown and utilised as the basis of more than one selected strain. Mr. Neal pursues an ordinary method of cultivation; does not thin out the pods for exhibition purposes; prefers medium sized seeds for sowing; and plants twelve inches apart in the rows. His longest pods have been fourteen inches, with eight beans in the pod. A variety known as Piper's Oxonian has been grown in the district for some years, and it developed as follows:—In 1871 Mr. E. R. Piper, tailor, Walton-street, Oxford, purchased of a local seedsman half-a-pint of beans, and among the plants was one that proved attractive, owing to its massive leafage and straight, delicate-looking pods; the colour and texture denoting fine quality and rather suggested that its origin might have been due to the influence of the popular dwarf bean Canadian Wonder. Be that as it may, Mr. Piper only saved one pod for next year's sowing. Of five plants, three were eaten off by slugs (his little back garden was surrounded by buildings), and the other two had to serve as stock producers. Mr. Piper was induced to exhibit at the Oxford and Bicester shows, gaining five firsts in one season in the amateur classes, but he afterwards secured the champion prize at Woodstock Show thirteen years in succession against all comers—a very fair record. About ten years ago he removed into the heart of the city, and, not having a garden, he handed his little store of beans to Mr. Holton, at Worcester College Gardens, who up to that period had no special knowledge of bean culture, but following Mr. Piper's methods, he soon proved himself a worthy and apt pupil. It should be stated that Mr. Piper never once dreamt of working up a stock of seed, four or five pods proving ample for his purpose. He preferred a plump, sausage-shaped bean for sowing, planting them in drills a foot apart, in a well-prepared trench, the latter of much service in keeping liquids from running away from the roots. Mr. Holton has since become an expert, and his wonderful dishes of fifty pods each have secured him any number of first-class prizes (I believe he has never been beaten) at the Oxford shows, and he has secured two firsts each year, for seven seasons past, at the Co-operative Show at the Crystal Palace, being gold medallist in 1895, in the southern section for gardeners. His strain has developed into long, straight, fleshy pods of fine texture, the longest pods having reached fourteen and a-half inches in length, with nine beans in a pod, of splendid colour; and without venturing an assertion, I should say the quality very closely resembles that of Sutton's Best of All. The vines are very strong and prolific bearers, requiring eight feet ash poles firmly laced to support the weight. Mr. Holton plants fourteen inches apart; uses the syringe freely in dry, hot weather to assist in setting the blooms; prefers the earliest pods for seed, as they prove plumper than later growths. He believes in liquid manure, and constant attention in the matter of thinning and selecting.

Among the amateurs (*i.e.*, those who do not grow for sale or employ a gardener), whose skill in runner-bean growing is fairly equal with the above-named, I may mention Mr. George Browning, butler at Jesus College; Mr. Edwin Thorne, butler at Wadham College (also a noted onion grower); Mr. Alfred Cripps, Jesus College; Mr. Thomas Newman, St. John's College; Mr. W. Edwards, Balliol College; and Mr. Joseph Green, carpenter, Old Headington, Oxford, who was gold medallist at the Co-operative Show, Crystal Palace, in 1897; the latter has been the winner of four silver and one bronze medal, and about thirty firsts for runner-beans; his total successes at Oxford and elsewhere amounting to fully five hundred and fifty prizes for horticultural subjects, including a large percentage of chrysanthemums. The photograph from which the accompanying illustration was made was taken after Mr. Green had gathered his special dishes for the Crystal Palace Show, in August, 1897, and an examination of the clusters of pods will reveal the fact that several of them contained nine beans each; a portion of the leafage had been cut away to show up the heavy-laden vines. Mr. Green's mode of treatment is as follows: Prepare a trench as for celery, fifteen inches deep; lay in nine inches of fat manure, and cover with four inches of soil; plant on May 1, fifteen inches apart, and stake at the same time with a stout rod; when the beans begin to grow freely water with liquid manure occasionally; eventually thinning the pods judiciously. He has named his strain Excelsior, and claims that it is a cross between Ne Plus Ultra and Girtford Giant.

With reference to the cottagers (*i.e.*, farm or day labourers), the most successful have been Mr. Barnard West, of Nuneham Courtenay, and Mr. James Simmons, of Kirtlington, the latter having been engaged in growing and selecting a strain for nearly thirty years, his first seed having come from a Mr. Webb, basket maker, of Bicester, a known expert in bean culture. From the above remarks it will be inferred that Oxfordshire is well represented by both onion and runner-bean cultivators; but all the other sections of vegetables are equally well grown, though there has not been quite so much enthusiasm displayed in these as in the two classes named.

Oxford. W. GREENAWAY.

THE CABBAGE.

It is said that in some parts of the country the crops of cabbage are so numerous and heavy, probably owing mainly to the mild winter, that many acres are being ploughed in as manure, because they do not prove sufficiently remunerative to market. And yet, although the cabbage has been described by a high authority as "by far the most precious vegetable we have, eaten young, in the right season, and well cooked;" those who are accustomed to dine in public places find out that in hotels and restaurants "cabbage as served up is frequently a disgusting mess, heavily charged with soda." M. Henri Vilmorin informs us that the best cookery of cabbages may frequently be observed among cottagers and servants brought up in country cottages; and he mentions the case of a duke with one of the finest gardens in England, bringing from London a specimen of some cabbage that he had relished, thinking the attraction was in the variety. And yet there is no lack of good cabbage, and the names of varieties are numerous. One catalogue gives as many as over fifty names, but many of them must be synonyms, as it is well known that a popular type of cabbage, as of some other vegetables, is grown under different names in certain districts of the country. But there are several distinct types, varying so much as to suggest an origin from different species; and yet they are the varied offspring from a common parent in the distant past. Between an ordinary white cabbage and a highly developed cauliflower there appears to be a very wide and almost bridgeless gulf of separation, and yet one is simply a development from the other. M. H. Vilmorin, in the "Vegetable Garden," alludes to the different sections of cabbages as differing perceptibly from one another in the size of the seed, the Borecoles and Kohl Rabi producing the largest seed; next to these the ordinary round-headed varieties, and the swedish turnip; and lastly, the cauliflowers and broccoli, which have the smallest seeds of all.

The importance of the cabbage as a cooked vegetable is shown from the extensive way in which it is cultivated. Time was when at Fulham, Wandsworth, Deptford, and other suburbs of London great areas of cabbage were grown, but the growth of population has operated to drive the cabbage gardens farther and farther afield, and now parts of Essex and Kent are given over to cabbage culture. Cabbages are sown at two seasons of the year—in spring and in late summer and autumn. April is the month for the spring sowings, and the last week in July and the first in October that made in what is known as the autumn. Cultivators tell us that the true character of a cabbage is best shown in the case of plants raised from spring sowings, the contrary being that if there are defects in a stock of a certain variety the act of sowing in the autumn will bring them out in the spring, when the plants are fully developed. Bolting is a freak in cabbages, and most gardeners have had experience of it. It occurs much more in spring than in autumn, the result being that, instead of forming a good, solid heart, the plant throws up an inflorescence, and is thereby prematurely matured. To save seed from such is bad practice, because there is reason to believe the tendency to bolt will be developed in the progeny. Fine and uniform stocks of cabbage can be maintained only by the most rigid selection of perfect plants for the purpose. The several seed firms who possess some very fine selections of cabbages assert that the most painstaking selection has produced stocks which are bolting-proof, and they point to yearly trials of their particular varieties, raised from seed sown both in spring and autumn, as affording abundant proof of the correctness of their contention. The time at which the seeds are sown, and especially so in the case of sowings made in August, has something to do with bolting, and probably the incidence of the season. This tendency can be conquered to a large extent by a careful selection of plants to produce seeds, and that this is being done is shown by the fine stocks of cabbages, and more particularly of early varieties, found in cultivation in the present day.

R. D.

MORNINGTON LODGE, WEST KENSINGTON.

Mornington Lodge is, indeed, a veritable London garden, surrounded as it is with buildings, and almost under the shadow of the "Big Wheel." It is the residence of Colonel Mount Batten, who succeeded to the collection of plants in general, and the orchids in particular, as left by the late Mr. Nalder, an erstwhile enthusiastic orchid amateur, who lent his name to a very fine variety of Cattleya Mossiæ, pronounced by the late Professor Reichenbach as "an astonishing beauty." A full description of this exceptional form is given in the sixth edition of "Williams' Orchid Manual" as having a general colour of a peculiar rose-purple, with a slight greyish hue; the sepals and petals are of a much darker purple, which in the sepals becomes a border, and in the petals is a quite distinct marking. There are two similar dark bands converging before the apex, leaving a purple-rosy disc, and a similar margin at nearly equal distances. Though described so long ago, and the collection has passed through severe vicissitudes, it is gratifying to find that there are three portions of the original plant still in existence here. The orchids here are contained in four divisions, mostly grown in conjunction with other plants, and in particular instances their healthy condition aptly proves the wisdom of such a course of treatment. A small, low structure, which at some more or less remote date was evidently used for the more plebeian cultivation of cucumbers, seems well adapted to the needs of the more popular kinds of dendrobiums, such as D. nobile, D. Wardianum, D. fimbriatum, D. densiflorum, D. Parishi, D. chrysotoxum, particularly fine being some plants of D. aggregatum and D. primulinum and D. giganteum. Here also had been grown, but since removed to a more effective show house, a grand batch of a truly fine form of Thunia Marshalliæ. I counted sixteen large pots with several growths in each, all of which were carrying grand heads of gracefully disposed white and orange-yellow flowers.

The main glass structure is a large span, with a lantern roof running north and south, about one hundred feet long, divided into three compartments. The first contains, besides orchids, a general collection of stove plants, with climbers such as Cissus discolor and Clerodendron Balfouriana on the roof. On the east side stage is the main collection of the ever popular Slipper orchids, those in flower at the time of my visit being the distinct Cypripedium Druryi, several plants of C. Rothschildianum, C. Stonei, C. Lawrenceanum, &c.; also present are good plants of C. Leeanum, C. laevigatum, C. Schlimi, C. sedeni, and a wonderful specimen of C. Sanderianum with half a dozen growths, and evidence of having flowered recently. Suspended overhead are some useful examples of Cattleya aurea and C. gigas. Amongst the stove plants on the central stage are suspended several plants of the Garland Orchid, Cœlogyne Dayanum grandis, each with three or four spikes of their peculiar biscuit-coloured flowers. High up in the roof are some healthy plants of aërides, vandas, and saccolabiums, whose roots drop down almost to the floor. Noteworthy plants are Vanda Denisoniana, with two spikes, V. Cathcarti, V. Sanderiana, Aërides expansum Leone, and Saccolabium Blumei majus. There is also a large plant of Angræcum eburneum, five feet high, and others of this peculiar flowering genus, such as A. sesquipedale. On a shelf are batches of Calanthe Veitchi, and C. vestita, orchids not worth growing near London on account of their extreme susceptibility to the injurious effects of fog. In the middle compartment are grown, on the west side, a varied assortment of Cattleyas and Lælias, a fine, dark, shapely form of C. Mossiæ superba standing out conspicuously from the rest. Special examples are a grand specimen of Lælia elegans, belonging to the "Turneri" section, L. autumnalis alba, Cattleya Eldorado, C. Wallisi, and C. labiata.

Suspended above are good specimens of Odontoglossum citrosmum their long drooping spikes of bloom emitting a delightful odour, and healthy plants of O. hastilabum. Here also are several large specimens of Dendrobium Kingianum album, which is said to be rare, and has longer bulbs than the type. In a corner is a group of the useful winter-flowering Cœlogyne cristata and Lemoniana, now preparing for next season's display. The centre stage of this house is filled with palms, ferns, and specimen Cypripedium barbatum. The stage on the east side is partly taken up with C. insigne, C. villosum, and C. Boxalli, Miltonia vexillaria—in flower, good plants of M. Clowesi, a fine piece of the old Zygopetalum Mackayi, several species of cœlogyne, amongst which is a grand plant of C. Massangiana, that recently carried sixteen spikes of bloom. In flower was the pretty orange-scarlet Cochlioda Noezliana and C. rosea, Lycaste Deppei, L. aromatica var, and Anguloa Clowesi. The third section contains a mixture of camellias, fuchsias, liliums, and orchids. These are on the western side, and comprise a goodly number of Odontoglossum crispum, O. Pescatorei, and others. I noted O. luteo-purpureum, with two spikes, O. cordatum, large plants of Trichopilia fragrans, and several good pans of clean-leaved Pleione lagenaria. The orchids are now in the hands of Mr. T. A. Hooker, who, with his Clare Lawn and Blenheim Palace experience, may be depended upon to maintain the collection in the best possible condition.

Besides orchids, Mr. Hooker has two vineries to think about, and a conservatory to decorate, though the latter, being of the old-fashioned stamp, in which numerous plants, such as palms, tree ferns, rhododendrons, and climbers, find a permanent home, but few flowering plants are needed to give it a gay appearance. Colonel Mount Batten is justly proud of his fine batch of gloxinias, of which there are positively hundreds, numerous examples being in sixteen-sized pots, with dozens of flowers and sturdy green leaves. The pure white variety named Her Majesty is represented also by large specimens. Just out of flower was a fine batch of Gesnera coralina, its brilliant orange-scarlet flowers and large green leaves making a very striking display. The ferns here are also representative, many rare forms of adiantum being grown; a variegated form of A. cuneatum struck me as being particularly unique.

W. H. Young.

NATURE VERSUS CULTURE IN FERN VARIATION.

The following is the text of the paper read by Mr. C. T. Druery, F.L.S., at the meeting of the Horticultural Club on the 14th inst. :—

As a fairly long period had elapsed since I inflicted a paper about our unpopular British ferns upon the members of the club, I ventured timidly to hint to our secretary that a further dose might be administered now without immediate fatal effects, and suggested "Fern Revelations by a Fern Reveller" as a possibly taking title. Mr. D'Ombrain, averse, probably, to snuffing out an old member, and relying upon the lassitude usually accorded to those afflicted with a mania, kindly acquiesced. Upon this encouragement I dropped the jocular title held out as a bait; and determined to spring my ideas upon the club in a severe form, and one more adapted to discussion, because it involved a theory which is open to challenge. "Nature *versus* Culture in Fern Variation" was the first title adopted, a title which I admit at the outset is open to criticism, because Nature is as much at work with plants under culture as with plants which grow wild and altogether independently of man's efforts or doctoring, while the variation, too, should not have been limited to ferns, since the whole tenor of my argument to come is applicable to all plants and not merely to one family, and I consequently claim to cover a wider field than such title justifies.

So much by way of preamble, and now to my object proper, which I propose to demonstrate mainly by submitting the very tangible medium of actual Nature prints, a considerable number of remarkable fern varieties found perfectly wild on these islands. These prints, I may add, were the outcome of much loving labour on the part of the late Colonel A. M. Jones, of Clifton, who made our British fern varieties his study for many years, and to whom and Mr. Lowe, the collection known as the Carbonell collection at Kew is largely due, Mr. Carbonell having caught the fern fever from Colonel Jones, who, furthermore, aided him very materially in the subsequent splendid results. Prior, however, to specially referring to these prints, I should like to point out that this particular hobby of fern hunting, *i.e.* variety hunting had, I believe, no fair parallel in connexion with any other family of plants, so far, at any rate, as concerns its results, and the care with which these results have been recorded, as in the case before us. The nearest to a parallel perhaps exists in the case of orchids, new forms of which are assiduously sought for in their habitats all over the world with well known results, which also go far to strengthen the theory I advance, viz., that plants vary quite as much, and as widely under purely natural conditions as they do under culture—and that the apparent difference is due solely to the following causes:

First, as regards varieties found wild. (1) The wild sports are usually solitary specimens of their kind, and it therefore needs a special and more assiduous search by practised eyes to discover them. (2) They mostly occur in wild and unfrequented places, where chance discovery is reduced to a minimum. (3) They are usually associated and mixed up with enormous numbers of the normal forms, and these, as already stated in No. 1, require the expert's eye to detect them; and (4) very few people indeed have either the extreme patience or persistence the search demands, coupled with the requisite knowledge to enable them to detect new forms. Cultured plants, on the other hand, are grown under precisely opposite conditions, all favourable to discovery of any sports which may occur. Thus: (1) they are sown and grown in trade hands from beginning to end, by men who are practically experts in discrimination, and profit largely by their discoveries. (2) They are raised without admixture with other species in varieties, and in the process of transplanting, re-potting, and bringing on generally, are practically inspected individually many times, so that a difference can hardly escape notice; and finally (3) most important factor of all, cultivated plants are rarely normal ones; they are themselves, with few exceptions, the result of selection, *i.e.*, are the offsprings of sports, and hence, as is universally known, extremely liable to sport still more.

From these facts it is seen that the capacity of plants for sporting or varying might be just as great in their wild state as in their cultivated state, and yet the accumulated results might be practically *nil* in the former case despite their abundance in the latter; the outcome being the belief which generally exists that the variation observed is induced by culture, which leads on to other theories, that it is due to change of environments as well as treatment. For the same reason we find the most eminent botanists classing as "garden varieties" certain ferns of a crested character, like Lastrea pseudo mas cristata, as if they had been arrived at by cultivation, and until quite recently this idea of the artificiality, so to speak, of these abnormal forms led to their utter neglect by scientific botanists, though, as I contend, when they are regarded in their true light as purely natural sports they become a peculiarly fit study for the evolutionist and afford a splendid field for biological research, since it is far more among the vagaries than among the fixed forms of organic life that Nature is apt to reveal her secrets. As soon, indeed, as the abnormal forms begin to be properly studied—and I think I may claim to have induced some research in this particular direction—one of the first results was the discovery that the presumed hard and fast line existing between the two forms of fern life, the prothallus form and that of ferns as we know them, was a myth; since it was found to be broken through very frequently. Thus several varieties of several species are known now to produce prothalli on their fronds, and conversely produce fronds on their prothalli by simple asexual buds, while to cap the climax, Mr. Lang found that spores were actually produced on the prothalli of several species, and although these did not get the length of perfecting in the cases he observed, the possibility was demonstrated of ferns existing from generation to generation as prothalli only, a long step backwards to their cousins the lichens, though these particular spore-bearing prothalli were produced from such highly-developed forms as the Hart's Tongue (Scolopendrium vulgare), and Broad Buckler fern (Lastrea dilatata).

Though seemingly, in making these remarks, I have somewhat diverged from my subject, it is not so really, for all the ferns upon which these discoveries were made were abnormal ones, and wild finds or the true offspring of wild finds [illegible] same characteristics; and this brings me to a comparison in this particular connection of the results obtained where selective culture and assiduous hunting have both contributed their quota to collections.

Mr. E. J. Lowe's little book "British Ferns, and Where Found," published in [illegible], is recognised by all experts as a reliable descriptive catalogue of known varieties of British ferns at that date. The total number described is 1,859, to which must be added a considerable number of independent finds of similar forms, and figuring consequently under the same names. I have been through that list, and, analysing it, I find that without reckoning these repeats there are no less than 1,119 wild finds, as against 740 different forms raised from such finds and distinct enough for separate naming, *i.e.*, a ratio of sixty per cent. wild as compared with forty per cent. cultivated. Another important fact in this connection is that the common forms of the species have been utilised for a long time in gardens by the million, and thus to a certain extent must be ranked with cultivated plants, but only one or two examples are known of varieties being found among such plants, and even in these cases it has transpired that the plants had been brought in indiscriminately from wild habitats, and that even these finds may reasonably be assumed as involuntary importations and not due to cultural care. As you will presently see from the prints, these "sports" are not in any case "incipient breaks" which have to be worked up to become good and distinct varieties; they are often finished productions, and in many cases the best efforts of the selective raiser have failed to better them. On the other hand, in other cases the usual result of improvement by selection has been attained, but always and only from a fair start given by Dame Nature's unaided hand.

We see, therefore, that in ferns, at any rate, the capacity for sporting is by no manner of means dependent upon culture, and, as a fern-hunter with some successes, I cannot agree for one moment that these sports are due, as some scientists think, to any effects of the environment or attempts in the organism to adapt itself thereto. The "finds" grow under precisely similar conditions as the normal forms around them. A thousand seedlings line an earthen dyke faced with rough, unhewn stones; their fronds peep out from every chink, and here, in the very heart of a clump of the common form, is one of the most diverse fashion conceivable. To get it, it has to be literally sorted out of the bunch of fronds and roots of its purely normal companions, and yet it is not only a thoroughbred variety, tasselled, curled, or what not, but every spore it subsequently bears may breed true as a die, and, under quite different and varied environments, will reproduce the type to a nicety generation after generation.

As for fern adaptation to environment, it is quite possible that, had it not been found, it would have been smothered by its fellows, for tasselling, congesting, and dwarfing are always at expense of height, and that means handicapping to a certain extent. In this connection, too, the extreme diversity of the variations should logically imply a great diversity of environment, while, as we have seen, there is none at all. The "sport," too, is, judging by its subsequent true offspring, diverse in character even in the first frond, and hence the sport originated in the very ovum itself, or in the spore which was shed from one of the normal plants around. If the sport existed in the spore, we arrive at a local affection of the mother-frond, which bore millions of spores, one of which, at any rate, was subtly modified so as to produce a new form; and here our environmental difference narrows down to part of one frond out of many on the plant, itself one of thousands all growing together under the same or such similar conditions as could not necessitate so great a change of form as a requisite factor of existence or even as a facility, since, as we have seen, the effect may be adverse instead of favourable. To my mind, this question of variation is an inscrutable one at present, that is, the initial original variation, of which the fern prints I shall show you portray the actual examples. Subsequent variation, to which our selective breeders owe so much, and which represents largely cultural variation, is another matter; since, leaving aside the variation induced by crossing and consequent conflicts between the tendencies of diverse parents, we know that once the normal fetters have been broken, once the little cells have taken, as it were, the initiative of planning, they rarely return to allegiance altogether, and are constantly liable to vary their performance again and again, the watchful eye of the cultivator being ever on the alert to guide them in the wished-for lines by drastic weeding out, or profit by their ingenuity when they strike a perfectly new idea. The original start, however, which can transform plants to the extent which I will now exhibit by pictorial aid, with Nature herself as the artist, is, to all intents and purposes, a "special creation," which the evolutionist leaves, as I think, far too much outside his calculations. (About a hundred Nature prints of wild finds of most of the British species were here exhibited, with elucidatory remarks, many of the types being of extremely advanced character.)

We have now seen what Nature does and is doing in our sylvan nooks and corners where ferns are in their element, and I think you will agree with me that if fern hunting has no other merits, it has, at any rate, led to a very effective study of what wild plants are capable. True it is that among the hunters and finders we cannot rank one true professional scientific botanist. The research began on purely amateur lines, and only amateurs have caught the fever. With these prints and their attached notes before us, however, the evidence becomes acceptable to the veriest scientists, and I submit they go a very long way indeed to prove my theory that variation altogether is due to something other than culture, and that however great a part the environment has played in evolutionary shaping, it is a fallacy to suppose that "sports" can be imputed to attempts at adaptation thereto. The real cause, to my mind, lies deeper, and is one with that which underlies the evolutionary scheme as a whole, and utterly passes the comprehension of man.

Nicotiana affinis.—What a lovely pot plant this makes, and even in 48-sized pots it is a most useful subject. Where evening decoration is required, combined with fragrance, it should be used. The treatment and culture it needs is so very simple that I do not wonder at it being so very popular as a window plant. I have also noticed it grows largely in railway signal-boxes, and no doubt it is prized by the men on night duty. The seed being so very small, some care is needed to ensure its equal distribution. For shady corners, either indoor or out, it proves a most useful plant. In borders it is quite at home, and I find it seeds readily, and sows itself freely, but the self-sown plants never carry such fine foliage as those which are planted out. Grown in 16-sized pots this nicotiana makes a good specimen for porticos, front entrances, &c., and here on dull or rainy days a wealth of bloom expands.—Stephen Castle, R.H.S., *Bottesford Vineries, Notts.*

Messrs. Sutton and Sons' Annual Outing was conducted this year with the usual success, for the firm does all in its power to ensure a good day's enjoyment for its employés. This year Southampton and the Isle of Wight were selected for the excursion, and a special train, containing nearly seven hundred passengers, left Reading at half-past seven a.m., Southampton being reached at the appointed hour, half-past nine. Arrangements had been made for those of the party who had time to inspect the new docks, the warehouses and any of the South Western Railway Company's steamers, also two of the South African liners then in the docks. At a quarter to ten a specially chartered steamer left for Ryde, Sandown, Shanklin, and Ventnor, and back, while at half-past ten a second steamer proceeded to Cowes and Totland Bay. Her Majesty the Queen had graciously consented to permit members of the party to visit Osborne, and as a consequence a large number, including the members of the firm, landed at Trinity Pier, and the party were conducted over the extensive and beautiful grounds by Mr. Slater, agent to the Osborne estates, and Mr. G. Nobbs, the head gardener. The sea was beautifully calm, and consequently the trips were much enjoyed. Among the party were Mr. and Mrs. Martin John Sutton, Mr. Arthur W. Sutton, Mr. Leonard Sutton, Mr. M. F. H. Sutton, Miss Kathleen Sutton, Master Phil Sutton, and Master Arthur P. Sutton.

NOTES ON ORCHIDS.

Cymbidium canaliculatum.

This curious and interesting orchid is a native of north and east Australia, where it has a very wide distribution, though not found in any great quantity in any particular locality. The species was discovered early in the century by Dr. R. Brown, who found it near Cape York. In 1865 Mr. J. G. Veitch re-discovered it at the same place, and introduced it to British gardens. It is not sufficiently showy to merit the attention of the majority of present day orchid growers, but it is a most distinct species, and one that should prove of considerable value to the hybridiser. It has growths that are almost pseudo bulbous, and only a few inches long; the leaves are linear, sometimes twelve inches in length. The inflorescence is a raceme varying in length from one to two feet, and bearing, in the case of the form herewith figured, forty-five flowers. In the type the flowers are brown with green margins, and the lip white with pink markings; in the variety exhibited a few weeks ago by Mr. D. Smith, gardener to J. Sparks, Esq., Heathcote, Ewhurst, Surrey, the flowers are almost black—an intense vinous purple; the lip is small, as shown in the illustration, white, with blackish-brown margins and markings. No varietal name was given to this orchid, but it differs considerably in point of colour from the type. The R.H.S. Orchid Committee considered it worthy an award of merit on April 26 last, and on that day the plant was a source of great interest.—C.

Odontoglossum crispum Luciani.

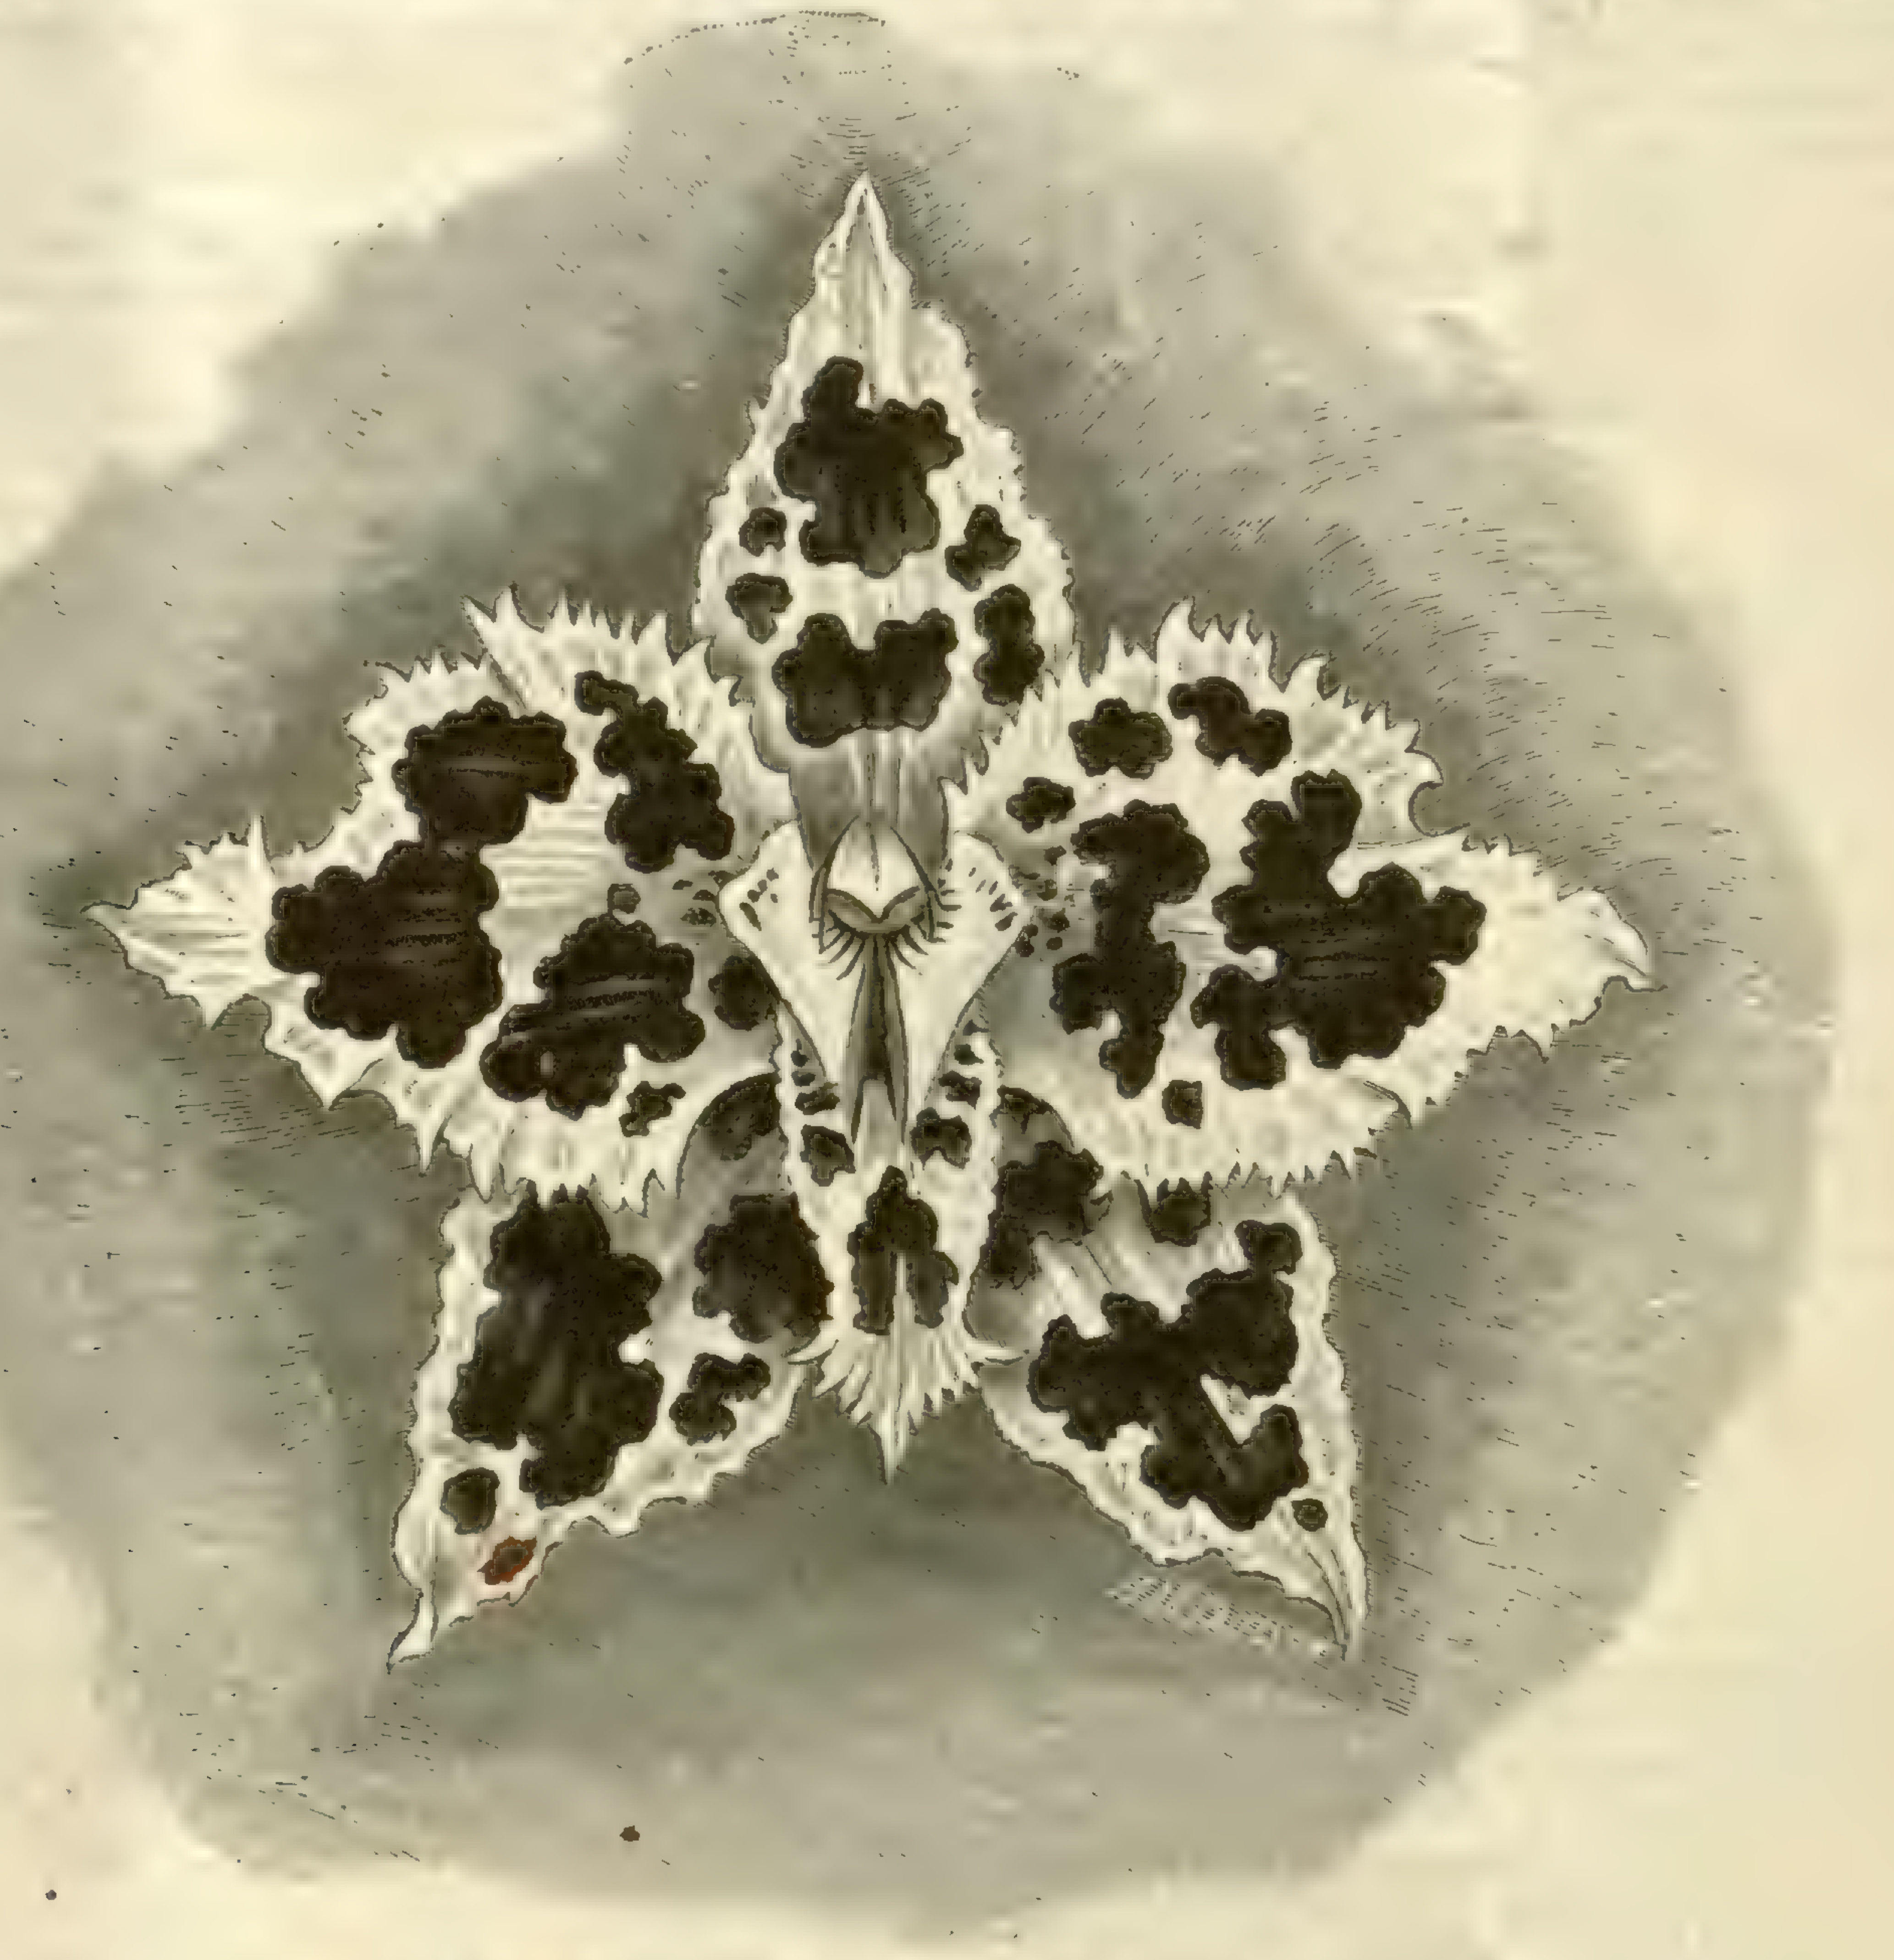
For brilliant colouring, combined with fine form, Odontoglossum crispum Luciani takes foremost rank among the many exquisite varieties of this most popular orchid now in cultivation. It is not unlike O. c. augustum, and even more shapely than it. The flower has a white ground, tinged here and there with rose; on the broad petals are very large and bold red-brown blotches; the sepals are similarly marked, but the markings are somewhat smaller. The somewhat narrow lip has a large red-brown blotch near the apex and smaller ones towards the base. The margins of the petals are denticulate, those of the sepals wavy. We have previously described this fine odontoglossum, and now take the opportunity of figuring it. O. c. Luciana was imported by Messrs. Lucien Linden and Co., Brussels, and bears the name of the head of the firm.

Orchis monophylla.

This is a pretty little Burmese orchid with fleshy oblong leaves, narrowed into a sheathing base, bright green, freely strewn with large red-purple spots. The leaves are very handsome, and so twisted as to present somewhat the appearance, in shape, of a paper bag such as the grocers twist from a square sheet of paper. The peduncle rises from the base of the leaf, and is partially surrounded by it; it is six inches or so in height, and carries a raceme from two to three inches long. The small flowers are a third of an inch long, white, with a faint pink blush; the tiny sepals, however, are greenish. This species was originally named Habenaria monophylla, but more recent examination of living specimens has resulted in the species being placed in the genus Orchis. The discoverer of O. monophylla, which, by the way, has sometimes two leaves, was Colonel Sir H. Collett, K.C.B., F.L.S.; tubers were sent to Kew by Mr. H. H. Hildebrand, Superintendent of the Southern Shan States, in 1896, and the resulting plants flowered last year and again this year. *Bot. Mag.*, t. 7,601.

Eriopsis rutidobulbon.

This novel and not unattractive orchid is now flowering in the warm orchid house at Kew. It is a Columbian plant, and one that was discovered by Purdie and introduced to Kew in 1849. The specimen Purdie brought home was the only one he met with. Latterly the species has been imported frequently, and flowering plants with long racemes of orange-yellow and red-purple flowers have been exhibited at the Drill Hall on several occasions. Mr. Thorne, Sunningdale Park Gardens has shown it in fine condition several times.



ODONTOGLOSSUM CRISPUM LUCIANI.

TOMATOS.

One has to be at some little trouble to have tomatos ready for the open ground by hardening them off before planting out in the open. It is a good plan to let them stand in a sheltered spot for a week or ten days before planting in final quarters, and the way that we treat our plants is to have them well advanced in fruiting pots by May 14 or 16, with one bunch or truss of fruit already set. Then we put them out in pots plunged up to the rims in prepared beds, leaving about two inches of space between each pot. In this way we ripen tomatos in the open annually equal in quality to indoor fruit. When treated in this way they are very handy should wet weather set in, for as they begin to feel the damp and cold they can with very little trouble be taken indoors and ripened off perfectly. For late cropping in the houses I find this mode very convenient, and usually make it a point to have from three hundred to four hundred ready to lift in August, and by so doing prolong the tomato season at least two months. At the last we take cuttings for early crops from the most prolific plants, as by doing so we can depend upon early fruit of the finest quality and perfectly true.

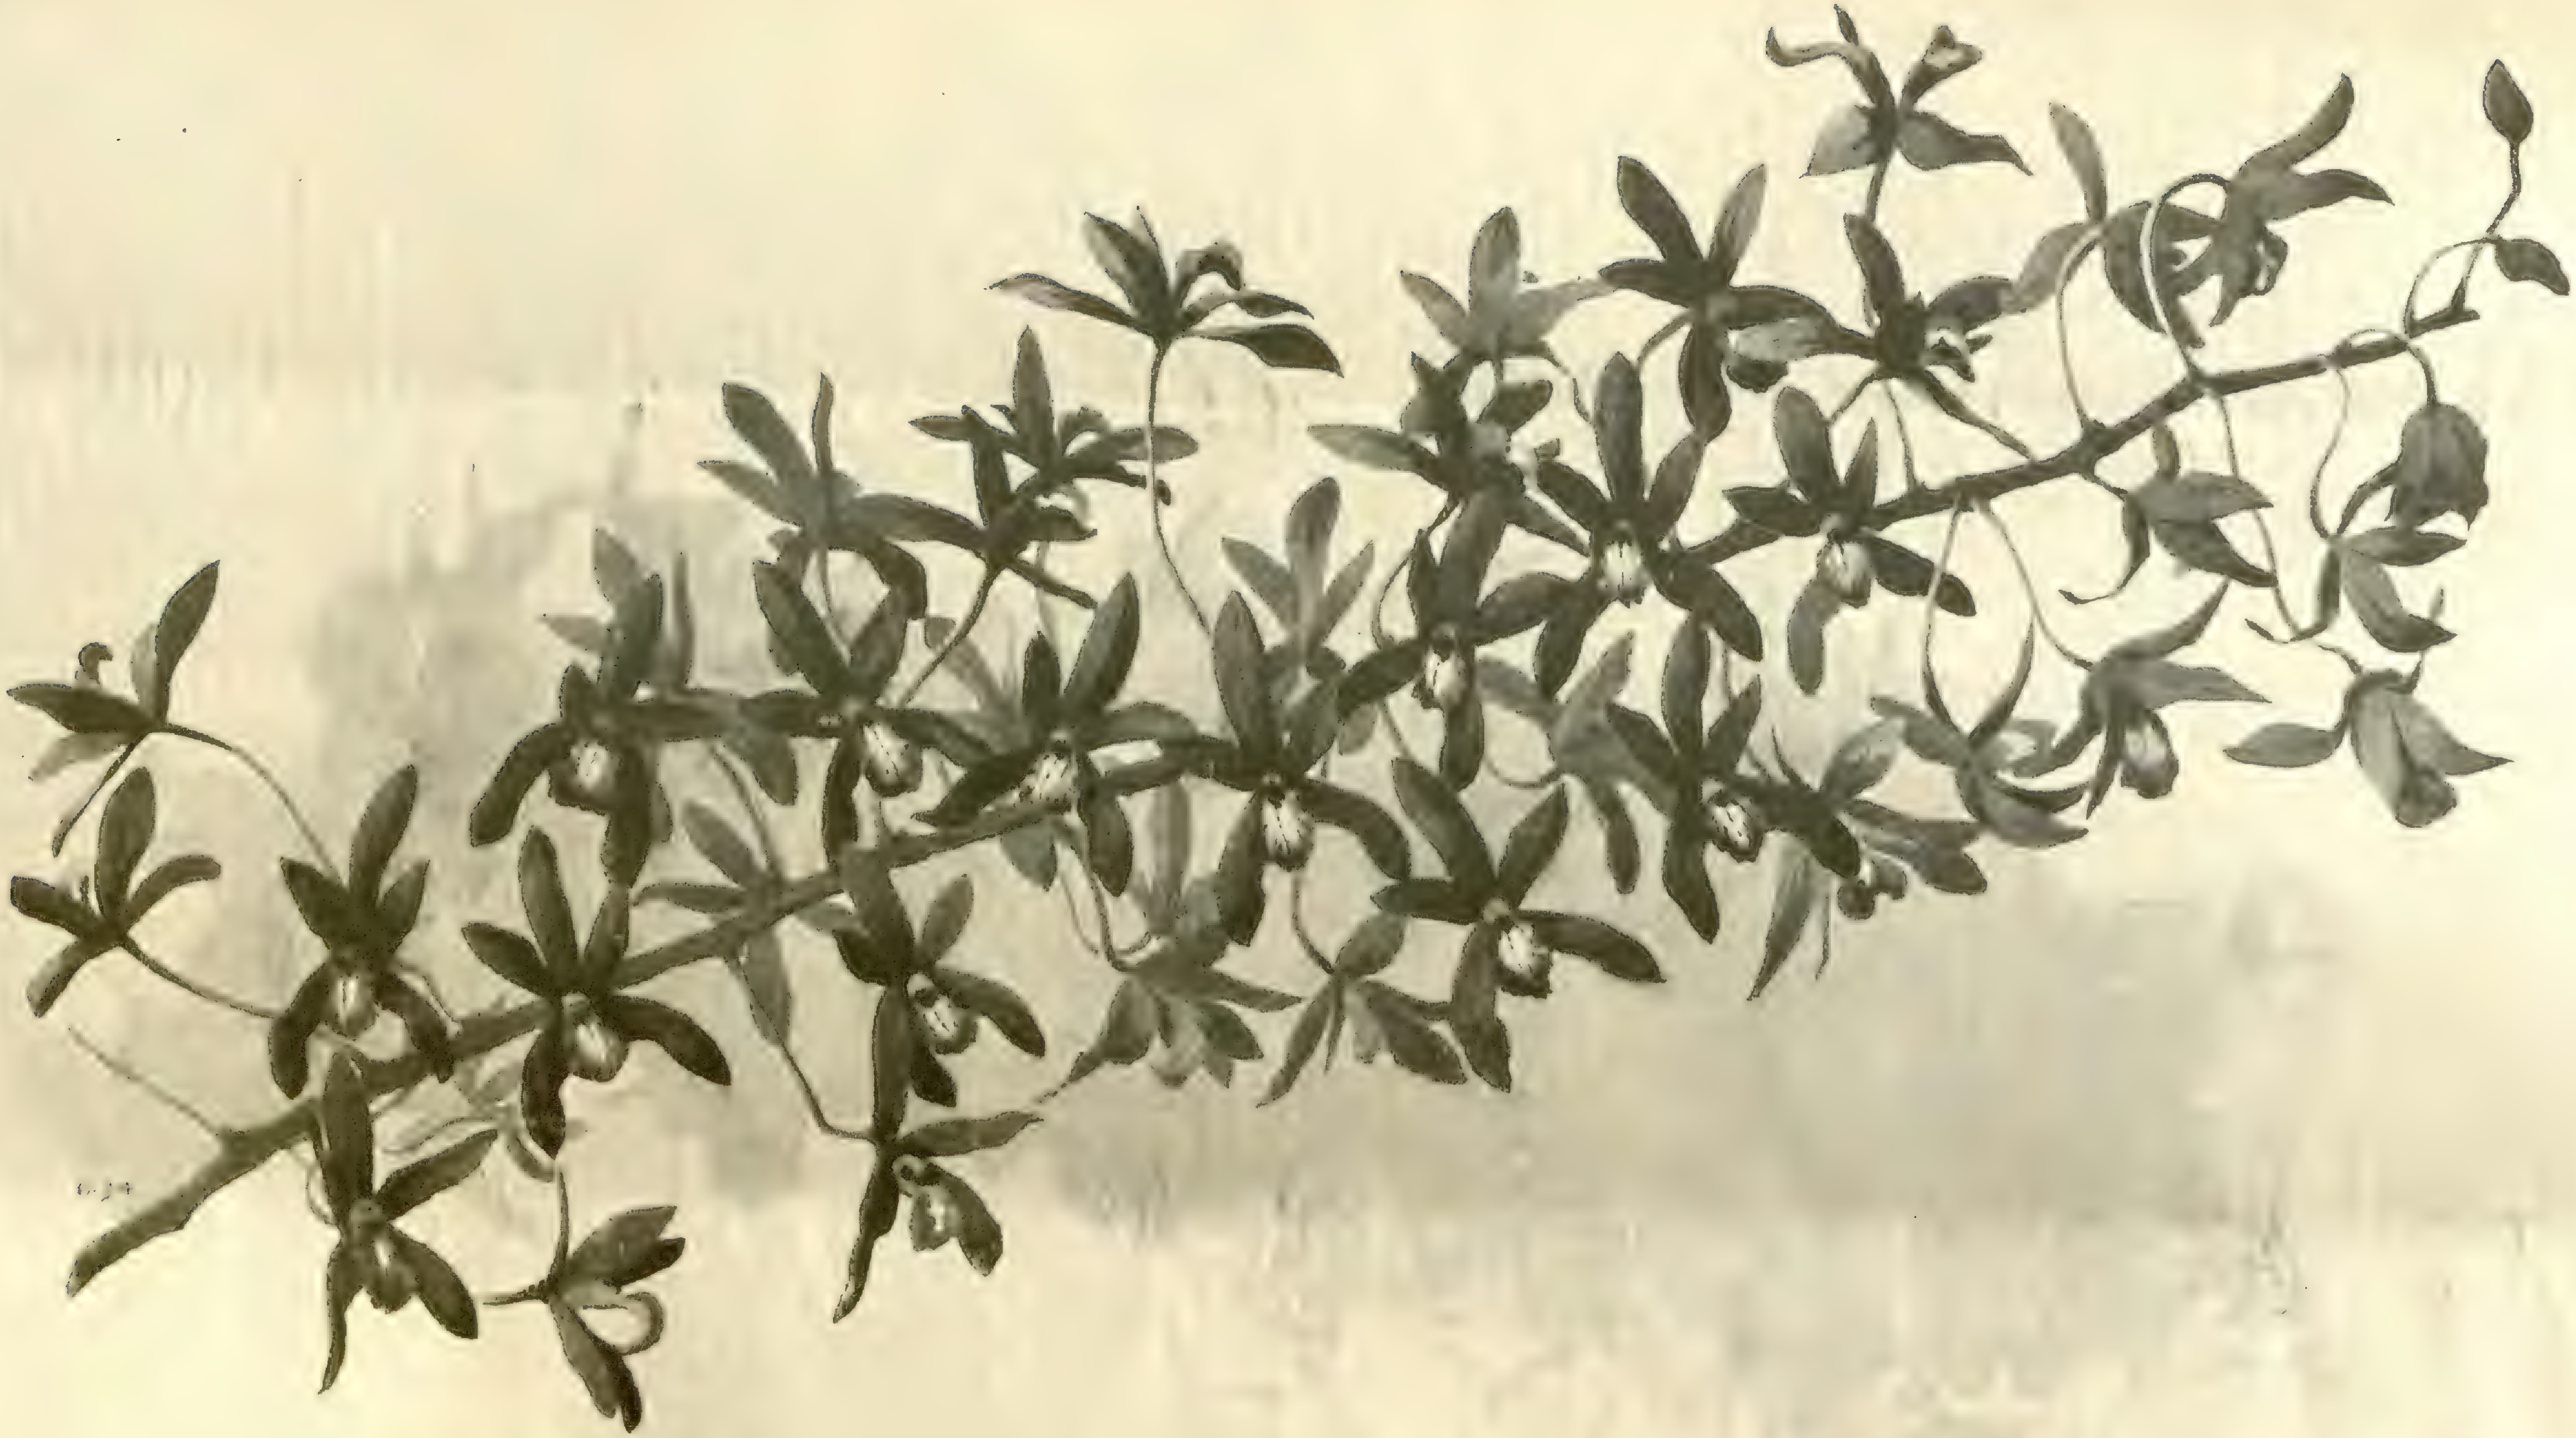
The tomatos I find best for outdoor cropping are Early Ruby and Sutton's Abundance. These bear the best fruit when grown from cuttings, being nearly as prolific as when grown from seed, while the fruits are of a much finer quality. Then also the plants do not suffer from disease of any kind. I would recommend everyone to give Abundance a trial, and once tried, it will be always used. We reduce the foliage of this variety, cutting it back to two leaflets, and find the plants do better so than when left alone. When tomatos are planted out in borders and bad weather sets in, then one sees all labour lost; but in the way mentioned the only trouble is that it gives a little extra labour; that is, however, amply repaid, and there is the satisfaction of knowing that one's efforts will have profitable results.

T. Davies.

Castle Hall Gardens.

An Unlucky Tree.—From ancient times May has been accounted an unlucky month, and it is presumably to the fact that it has given its trivial name to the flower of the thorn that we must look for an explanation of many of the evils which the latter portends to the rustic mind. History tells us that the [illegible] thorn was chosen by Henry VII. for his heraldic device because, after the [illegible] of Bosworth, the crown of Richard III. was found concealed in a neighbouring bush of that description. But this happened in August, and even the [illegible] have nothing to say against the hawthorn when once it has shed its [illegible] flowers. Its crop of bright scarlet "haws" is always welcome, though the humble fruitage gives prophetic occasion to many. It is almost universally regarded [illegible] as the certain presage of a severe winter, a very harmless superstition [illegible] birds might, or might not, approve could it be interpreted to them. There is a rather curious confusion of mind about the forecast, which does not, however, seem to invalidate its claim to very general acceptance. Among ourselves it is chiefly the flower of the whitethorn that is burdened with ominous associations; but [illegible] is by no means particular to a shade of colour, for, according to a writer in the [illegible] it is not long ago that the dangers of red hawthorn actually led to proceedings [illegible] taken in a French law-court. A fine tree in the grounds of a resident in the Department of the Seine-et-Oise was formally charged by the neighbours with [illegible] affecting all the crops within ten miles of it. Deputations waited upon the [illegible] and upon the Mayor and the Municipal Council; and the refusal of the [illegible] cut the tree down led to a great display of local excitement and indignation.

THE GARDENERS' MAGAZINE, JUNE 25, 1898.



CYMBIDIUM CANALICULATUM VAR. (Flowers blackish purple.)

R.H.S. EXAMINATION IN HORTICULTURE.

THE Rev. G. Henslow and Mr. J. Douglas, who were appointed to conduct the Royal Horticultural Society's examination for the current year, report as follows:

The annual examination in the principles and practice of horticulture was held on April 6. One hundred and ninety candidates presented themselves for examination. Of this number 155 were from all parts of England and 11 from Scotland; 19 gave no address on their papers. Three hundred marks were allotted as a maximum, and all candidates who obtained 200 marks and upwards were placed in the first class. The total number was 87, or 45·7 per cent.

Those who received 150 and less than 500 marks were placed in the second class. The number was 61, or 32·6 per cent. Those who obtained 100 and upwards were ranked in the third class. The number was 36, or 19·0 per cent. The highest number of marks was awarded to Miss O. M. Harrisson, of the Horticultural College, Swanley. The great advantage of systematic training is seen in the fact that of the pupils, *e.g.*, of the Swanley College, twenty-four were in the first class and only four in the second. Of those of the Technical School of Stafford, there were 12 in the first and seven in the second class; of the County School of Horticulture, Chelmsford, eight were in the first class and four in the second; while of the Horticultural School, Holmes Chapel, Cheshire, six were in the first class and four in the second.

Comparing the results with those of last year, we find that the number in the first class has slightly decreased, viz., from 89 to 87. In the second class there is an increase from 55 to 61; and also in the third class from 28 to 36. Those not placed have fallen from 12 to five. Comparing the percentages they stand as follows:—

	1897 (184).	1898 (190).
First class	48·3	45·7
Second class	29·8	32·6
Third class	15·2	19·0
Not classed	6·5	2·6

The answers were, on the whole, very satisfactorily given, and the general standard of those dealing with the elementary principles of vegetable physiology were somewhat better than was the case in 1897. There is also a general improvement in the answers to questions referring to practical horticulture. Most of the students have a good general idea of the work, although a limited number only went fully into the minor details of it; but some of these details are essential to a full measure of success, and as far as possible they should be included in the answers.

	FIRST CLASS.	No. of Marks gained.
1.	Miss Olive M. Harrisson, Horticultural College, Swanley	285
2.	Miss Mary Banks, County Technical School, Stafford	280
2.	Mr. O. H. Faulkner, County Technical School, Stafford	280
2.	Mr. C. Lawrence, County Technical School, Stafford	280
2.	Miss Ethel S. Lutley, Horticultural College, Swanley	280
2.	Mr. C. Mann, County Technical School, Stafford	280
2.	Mr. M. Wilson, Horticultural College, Swanley	280
8.	Mr. F. A. Gwilliam, A.R.H.S., Palace Gardens, Gloucester	275
8.	Mr. A. Tanner, School House, Cobham, Surrey	275
8.	Mr. F. Ovenden, County Technical School, Stafford	275
11.	Miss Mary H. Graves, Horticultural College, Swanley	270
11.	Miss Ethel E. Rands, Horticultural College, Swanley	270
13.	Mr. Henry Mitchell, County Technical School, Stafford	265
13.	Miss Jessie H. Price, Horticultural College, Swanley	265
15.	Miss Lilian Deane, Horticultural College, Swanley	260
15.	Mr. Herman Spooner, Technical Laboratories, Chelmsford	260
15.	Mr. Harry H. Thomas, 346, Kew Road, Kew	260
15.	Mr. Geo Underwood, Municipal Technical School, Leicester	260
15.	Miss Eunice Watts, Horticultural College, Swanley	260
20.	Mr. W. H. Brownridge, County Technical School, Stafford	255
20.	Miss Ada C. Bryson, Horticultural College, Swanley	255
20.	Mr. G. Mills, Bayham Gardens, Lamberhurst, Kent	255
23.	Mr. F. Botterill, County Technical School, Stafford	250
23.	Miss Ethel Edmunds, Horticultural College, Swanley	250
23.	Mr. Robert C. Gaut, 3, Gloucester Terrace, Kew, Surrey	250
23	Mr. Jos. Gillibrand, Horticultural School, Holmes Chapel	250
23	Mr. Jos. Hope, The New Gardens, Elveden, Thetford, Norfolk	250
23.	Mr. Arthur Jones, Horticultural School, Holmes Chapel	250
23.	Mr. Harry Miller, Technical Laboratories, Chelmsford	250
30.	Mr. F. E. Boyes, 19, Woodland Grove, Whitegate Lane, Blackpool	245
30.	Mr. E. T. Cole, Technical Laboratories, Chelmsford	245
30.	Mr. J. K. Cureton, County Technical School, Stafford	245
30.	Mr. Geo. Leadbeater, Junr., Horticultural School, Holmes Chapel	245
30.	Mr. A. J. Morland, Syon Gardens, Brentford	245
30.	Mr. R. Newman, Horticultural College, Swanley	245
30.	Mr. W. B. Pinder, County Technical School, Stafford	245
30.	Mr. Wm. Woodward, The Croft, Wallingford	245
38.	Miss Annie Ault, Horticultural College, Swanley	240
38.	Mr. Hy. Broadbent, Park Hall, Evesham	240
38.	Mr. Geo. Butcher, 188, Wellfield Road, Streatham, S.W.	240
38.	Mr. John P. Holt, Horticultural School, Holmes Chapel	240
38.	Mr. F. Lazenby, Botanic Gardens, Cambridge	240
38.	Mr. C. E. Malins, Horticultural College, Swanley	240
38.	Mr. Geo. Ord, Causey Wood, Marley Hill, Newcastle-on-Tyne	240
45	Mr. Isaac Godber, The Vineyards, Bracon Ash, Norwich	235
45.	Mr. W. J. Hurford, 3, Pound Street, Carshalton, Surrey	235
47.	Miss Marion Hawkes, Horticultural College, Swanley	230
47.	Mr. William H. Neild, Horticultural School, Holmes Chapel	230
47.	Miss E. Morland, 7, Gloucester Road, Kew	230
47.	Mr. G. W. Pyman, Technical Laboratories, Chelmsford	230
51.	Mr. John Benson, Liverpool Road, Aughton	225
51.	Mr. H. F. Easton, Pullar Road, West Barnet	225
51.	Miss Katherine M. Gervais, Horticultural College, Swanley	225
51.	Mr. E. F. Jeffrey, Horticultural College, Swanley	225
51.	Mr. A. Manson, Moreton Hall Gardens, Whalley	225
56.	Mr. Arthur Cooper, St. Peter's Street, Wallingford	220
56.	Mr. W. Cranfield, Botanic Gardens, Cambridge	220
56.	Mr. F. J. Crook, 14, St. John's Park Terrace, Winchester	220
56.	Mr. F. H. Harris, Technical Laboratories, Chelmsford	220
56.	Miss Hilda Leese, A.R.H.S., 31, Richborough Road, Cricklewood, N.W.	220
56.	Mr. A. D. Morris, Barrowmore Hall Gardens, near Chester	220
56.	Mr. Arthur Valentine, Laboratories, Chelmsford	220

	FIRST CLASS.—(*continued.*)	No. of Marks gained.
63.	Mr. E. Banks, County Technical School, Stafford	215
63.	Mr. Thos. Bell, 1, Alexandria Place, Paisley	215
63.	Mr. W. Brown, Cullen Gardens, Cullen, Banffshire, N.B.	215
63.	Mr. A. E. Burgess, Technical Laboratories, Chelmsford	215
63.	Mr. Hy. Davis, County Technical School, Stafford	215
63.	Mr. J. Richards, Horticultural School, Holmes Chapel	215
63.	Mr. J. C. Tate, The Villa, Bulmer, Welburn, Yorks	215
63.	Mr. John S. Thompson, Horticultural College, Swanley	215
63.	Miss Annie E. Young, Horticultural College, Swanley	215
72.	Mr. Thomas Benians, Horticultural College, Swanley	210
72	Miss Ada M. Cassidy, Horticultural College, Swanley	210
72.	Miss Elsie G. Callender, Horticultural College, Swanley	210
72.	Miss Frances E. H. Gervais, Horticultural College, Swanley	210
72.	Mr. A. Stirrat, Botanic Gardens, Glasgow	210
72.	Mr. F. W. Pallett, Technical Laboratories, Chelmsford	210
78.	Mr. C. Buckland, 3, Datchet Place, Datchet	205
78.	Mr. F. B. Davis, 4, Adon Terrace, Hendford Hill, Yeovil	205
78.	Mr E. Walker, Dairy Cottage, Wales, near Sheffield	205
78.	Mr. John T. Walker, The Gardens, Fairfield, Cobham	205
78.	Mr. Edward Semper, The Gardens, Scawby Hall, Lincs.	205
83.	Miss E. M. Brace, 62, Lower Sloane Street, S.W.	200
83.	Mr. Geo. W. Brookbank, 62, Queen's Road, Wimbledon	200
83.	Mr. E. J. Pitts, Horticultural College, Swanley	200
83.	Mr. F. Weiste, Horticultural College, Swanley	200
83.	Mr. W. H. White, Technical School, Leicester	200

	SECOND CLASS.	
1.	Mr. Hy. Brotherston, Gosford Gardens, Longniddry, N.B.	195
1.	Mr. J. Burden, Crowmarsh Gardens, Gifford, Wallingford	195
1.	Mr. J. Child, County Technical School, Stafford	195
1.	Mr. A H. Davis, F R.H.S., Albert House, Sutton	195
1.	Mr. W. Grantham, West Tower, Aughton	195
1.	Mr. W. Hamnett, 11, Granville Place, Stone, Staffs.	195
1.	Mr. R. Hudson, The Paddocks, Swaffham, Norfolk	195
1.	Mr. E. Miller, 55, Holly Road, Chiswick, W.	195
1.	Mr. Basil G. Stanley, Bredon's Norton, Tewkesbury	195
1.	Mr. Thos. H. Usher, Hoe Place, Woking, Surrey	195
11.	Mr. A. J. Brabner, Ivelhurst, Yeovil, Somerset	190
11.	Mr. Thomas Carr, Undermount Gardens, Bonchurch	190
11.	Mr. Louis Hales, Horticultural College, Swanley	190
11.	Mr. C. T. Illsley, Amblecote, Cobham, Surrey	190
11.	Mr. J. Jeffery, Moor Court Gardens, Stoke-upon-Trent	190
11.	Mr. J. Jordan, County Technical School, Stafford	190
11.	Mr. J. Lee, Gosford Gardens, Longniddry, N.B.	190
11.	Mr. J. F. Mitchell, Horticultural College, Swanley	190
11.	Mr. A. J. Pye, Technical Laboratories, Chelmsford	190
11.	Mr. W. Sproston, Great Haywood, Stafford	190
21.	Mr. Chas. Fogden, Poplar Villa, South Hayling, Hants	185
21.	Mr. H. R. Judson, The Gardens, Abbotts Worthy House, Winchester	185
21.	Mr. J. Prescott, Brookfield Lane, Aughton	185
24.	Mr. Hy. Child, County Technical School, Stafford	180
24.	Mr. C. Sellars, 5, Leaman Terrace, Linthorpe Road, Middlesboro'	180
26.	Mr. E. Dolman, Wychnor Park Gardens, Burton-on-Trent	175
26	Mr. Wm. Laurence, Technical Laboratories, Chelmsford	175
26.	Mr. S. Lyversage, County Technical School, Stafford	175
26.	Mr. Wm. Morris, Horticultural School, Holmes Chapel	175
26.	Mr. T. Ottewell, County Technical School, Stafford	175
26.	Mr. Edward Rustige, Horticultural School, Holmes Chapel	175
26.	Mr. Geo. H. Wicking, Technical School, Leicester	175
33.	Mr. W. Burgess, Bredon's Norton, Tewkesbury	170
33.	Mr. J. Clark, Bank Cottage, Waterhouses, Ashbourne	170
33.	Miss C. F. Fellows, Horticultural College, Swanley	170
33.	Mr. A. Morton, Horticultural School, Holmes Chapel	170
33.	Mr. Wm. E. O'Hara, Horticultural College, Swanley	170
33.	Mr. H. P. Appleton, Municipal Technical School, Leicester	170
33.	Mr. J. P. Quinton, 3, Ferry Road, Long Ditton	170
33.	Mr. A. Shaw, Staincross, near Barnsley, Yorks.	170
33.	Mr. W. Smith, Bredon's Norton, Tewkesbury	170
33.	Mr. W. C. Smith, Botanic Gardens, Glasgow	170
43.	Mr. L R. Baker, Blagdon House, Merton	165
43.	Miss Gertrude Bridger, Primrose Bank, Aughton	165
43.	Mr. G. J. Goodall, The Gardens, Streatley House, Reading	165
43.	Mr. W. Ness, Aberlady, Longniddry, N.B.	165
43.	Mr. E. Pedley, Holywell Green, near Halifax, Yorks	165
43.	Mr. R. Sumner, Liverpool Road, Aughton	165
43.	Mr. R. Y. White, 67, Queen's Street, Cheapside, E.C.	165
50.	Mr. L. Davenport, Horticultural School, Holmes Chapel	160
50.	Mr. Field, Newnham House, Wallingford	160
50.	Mr. E. Russell, Municipal Technical School, Leicester	160
53.	Mr. W. Galloway, Gosforth Gardens, Longniddry, N.B.	155
53.	Mr. J. Humphreys, Hillside, Winchmore Hill, N.	155
53.	Mr. R. Jones, Aughton Springs, Aughton	155
53.	Mr. W. T. Smith, County Technical School, Stafford	155
53.	Mr. P. H. Jones, County Technical School, Stafford	155
53.	Mr. H. Weddell, Haycroft Cottage, Surbiton	155
59.	Mr. H. Holmes, The Gardens, Garvald House, Dolphinton, N.B.	150
59.	Mr. B. Ling, Technical Laboratories, Chelmsford	150
59.	Mr. S. J. Sayer, Technical Laboratories, Chelmsford	150

	THIRD CLASS.	
1.	Mr. F. E. Belcher, Bush Hill Park, Enfield, N.	145
1.	Mr. A. W. Browning, Gosford Gardens, Longniddry, N.B.	145
1.	Mr. Henry Kingham, Laboratories, Chelmsford	145
1.	Mr. E. Powell, Heveningham Hall Gardens, Yoxford, Suffolk	145

30.	Mr. G. Braddy, Technical Laboratories, Chelmsford	105
30.	Mr. H. G. Chick, Moray Villa, Elm Grove, Caterham	105
34.	Mr. J. Fudge, Horticultural School, Holmes Chapel	100
34.	Mr. C. Rymes, 28, Cottage Grove, Surbiton...	100
34.	Mr. A. Wilkins, Martyr Worthy, near Winchester	100

Questions.

EIGHT QUESTIONS ONLY TO BE ANSWERED: FOUR FROM DIVISION A AND FOUR FROM DIVISION B.

Division] A.—Elementary Principles.

1. Describe the methods of propagation of different weeds; explain why groundsel and chickweed and the large white-flowered convolvulus are particularly troublesome. What are the best means of exterminating these plants?

2. Point out the importance to the plants of a good circulation of air in a hothouse, and the consequences of a stagnant condition of the atmosphere within it.

2. Describe the different functions of leaves, and the best way to secure their due performance.

4. What are the component parts of a flower, and of what use are they respectively to the plant?

5. What external conditions are favourable for inducing variations to appear in cultivated plants; and how would you proceed in order to fix any variation?

6 What parts of the flower are retained and altered in forming the fruit of the peach, melon, mulberry, fir-cone, and pineapple?

7. To what natural orders do the following trees belong:—Tulip tree, maple, apricot, ash, laburnam, guelder-rose, horse-chesnut, horn-beam, thuia, and evergreen oak? Which are natives of this country?

8. Describe the structure of the bulb of the white lily, the corm of gladiolus, the creeping-stem of couch-grass, the rhizome of the flag, and the tuber of the potato; and explain their uses to the plants.

Division B.—Practice.

9. Describe landscape gardening as an art.

10. Describe the formation of a garden lawn, and the details of the work necessary to keep it in condition during the year.

11. What are the preliminary operations necessary to the laying-out of a garden for fruit and vegetable culture? Describe the arrangement of the fruit trees, and the method of planting them.

12. A garden having four walls facing north, south, east, and west, what varieties of fruit trees should be planted on each? Describe their first year's pruning and training

13. Give full details of the propagation and culture of grape vines and fig trees in pots.

14. Describe the culture of seakale, asparagus, and French beans; and the best method of forcing them.

15. What are the best manures for kitchen and fruit gardens? How ought they to be applied, and when?

16. Describe the propagation and culture of roses and carnations intended to be cultivated under glass.

The Adulteration of Dairy Produce is discussed at some length by Mr. R. Hedger Wallace, who has brought together a mass of statistics relative to the quality of the articles which come under the above head. The author's paper was read before the Royal Scottish Society of Arts in Edinburgh, and it constitutes a formidable indictment against the conduct of dairying both at home and abroad. The butter we import is apparently frequently adulterated. The reputed pure Normandy and Brittany butters, we are told, for example, have been found to contain as much as from 30 to 40 per cent. of margarine; and not only is this latter material employed to swell the volume of first-class butter exported to this country from these districts, but butter of inferior quality is imported from Central France, Italy, and even Australia, to be blended and forwarded to us as the best Normandy and Brittany butter. Another plan consists in importing Belgian butter, which enjoys a by no means high reputation, and then shipping it from Calais to England as Normandy butter, whilst Australian butter is also worked up to sell in London under the Isigny mark, a noted brand of Normandy butter. In the space of a little over two years it appears that of the samples of butter taken at port of entry into this country and analysed 10½ per cent. of the Dutch samples were adulterated, 2 per cent. of the Danish, 19 per cent. of the German, 5½ per cent. of the Norwegian, and 7 per cent. of the Russian. Unfortunately such adulteration is not confined to our friends across the Channel, and the practice of working up butters, as it is called, is carried an at home as well. It is clear that such extensive adulteration, as Mr. Wallace assures us goes on in the butter trade, ought to be energetically dealt with by our public authorities. Another important matter discussed by the author is the use of antiseptics or preservatives to milk, technically known as "drugging" the milk. We know that the addition of chemicals to milk as preservatives is prohibited in France on the grounds of unwholesomeness; cannot we induce responsible officials in this country to bring this matter to the notice of the Government, and have such treatment of milk included under the head of adulterants? The New York law on dairy products, passed in 1893, enacts, among other things, "that milk is adulterated to which has been added, or into which has been introduced, any foreign substance whatever." Surely it is time steps were initiated, if not by authorities responsible for the purity of our food supplies, then by the public themselves, to put a stop to so reprehensible a practice.

WORK FOR THE WEEK.

COOL ORCHIDS.

IT will not be an easy matter to keep the atmosphere too moist in the cool department at this time of the year, as the large amount of ventilation that is necessary soon drys it up; therefore the hose-pipe should be used freely damping every available space three or four times daily. There is very little to be done in the cool department during the summer months in the way of repotting, as the majority of the plants will have had new material afforded them by now. All the available spare time will now be taken up in cleaning and rearranging the plants; thrips, aphides, and other pests, which are the frequent cause of so much mischief, are apt to increase rapidly at this season, and it is absolutely necessary to keep them under at all costs, for their ravages prove doubly injurious now when the leaves are so young and tender. If these pests are destroyed before they have time to cripple the young growths, untidy-looking plants with spotted foliage are avoided. Especially is this the case with masdevallias, as the young leaves when once attacked by thrips soon becomes disfigured. The timely and mild use of Richards' XL. All Vaporiser will help to keep the pests in check, and save the orchid grower much trouble. There is one thing worthy of mention here, and that is the position in a house a plant may occupy. Should a plant not take kindly to one position do not hesitate to remove it, say, to the most airy position, near the ventilators, or to the most moist corner of the house; and once the right position is found it will grow away freely, and give much less trouble. The houses should be kept as cool as possible by day, but the night temperature should not be allowed to fall below 55 degrees.

Odontoglossum Rossi, O. aspersum, O. Humeanum, and O. Cervantesi are now commencing to grow, after having their short rest. As soon as the plants begin to emit new roots new material should be afforded to any that require it. These odontoglossums do best when grown in shallow pans or baskets suspended about a foot or eighteen inches from the roof glass, at the coolest end of the house; equal parts of peat and moss will suffice as a compost over good drainage. Care should be taken in the watering of these plants, never allowing them to become sodden at the root, but rather allow the compost to become moderately dry before giving water. Where a number of plants of O. Cervantesi and O. Rossi are grown they may be had in flower from January to June, but to do this some of the plants must be given a longer rest than others, thus causing them to start into growth later in the season. Lælia harpophylla is now beginning to grow, and any plants that require repotting or top-dressing should receive attention. A light position should be given them at the warmest end of the odontoglossum house, water being sparingly afforded them after root disturbance, but a full supply will be needed when root action becomes brisk. Lælia monophylla is a quaint little orchid, and quite distinct from all other lælias, the pretty orange-scarlet flowers being very bright and effective. The plants should be grown in very small pans or baskets, using a compost of equal parts fibrous peat and moss. The odontoglossum house is the best place in which to grow it, and here it should be suspended in the lightest position at command. This species delights in a liberal supply of water while making its growth, but much less will be needed during the winter months. Masdevallias of the Harryana and caudata sections have now passed out of flower, but a plentiful supply of water must still be given, as leaf development and root action are still in a vigorous condition. Masdevallias should be kept as cool and moist as possible during the summer months.—E. SHILL, *New Hall Hey Gardens.*

STOVE PLANTS.

Palms are now growing freely and must be encouraged by feeding; see that they are not unduly crowded, and also, if they are growing in a house where the light reaches them from one side; turn the plants occasionally, else they will lean to the side from which the light comes. Large palms which have occupied the same pots for several years will have their roots mated thickly in the bottom of the pot; such as these should have the ordinary surface material supplemented by standing their pots half their depth in a tub of water once a week; if there is no objection to the smell of liquid manure a little should be used. Syringe the plants well twice a day and if creepers are grown overhead it will be necessary to sponge the fronds occasionally, for if palms are to thrive it is imperative that the fronds should be kept thoroughly clean. When used for furnishing rooms they should be changed weekly, be careful not to overwater while in the rooms, and when taken back to the palm house thoroughly cleanse the fronds from all dust. If necessary to retain them in the rooms for long periods they should be sponged at least once a week, and the water used for watering them should be lukewarm. Give regular attention to the tying and thinning and regulating of stove climbers, if the syringe is freely and intelligently used upon them twice daily insect pests will have a very precarious footing. Keep the shoots sufficiently thin to allow the free ingress of light to the plants beneath.

Achimenes are now growing freely, and the stock of any particular variety may be increased by means of cuttings. Those growing in pots as the shoots get a few inches long should have light stakes inserted to tie the shoots to as they progress; as the pots become filled with roots resort to feeding, remembering, however, that one overdose may ruin them. Pot on young plants of Sphærogyne latifolia—this is a noble stove-foliage plant—grow in a warm, moist heat, and be careful not to injure the foliage. Pot on young stock of Sanchezia regina, crotons, dracænas, gloxineas, asclepias, and other plants before they become restricted. Afford anthuriums and marantas abundance of water, and see that they are protected from strong sunshine, else the foliage will suffer severely. Eucharis are growing freely, and must be afforded stimulants regularly; do not dry eucharis to induce them to flower, by doing so, one lays them open to injury from the mite. Keep them growing freely, and though the mite be present, it will do them no material injury. Repot any caladiums requiring larger pots, give only a small shift, and be sure the roots are thoroughly moist before the operation. Saintpaulia ionantha which was pricked off a few weeks ago are now ready for potting off singly in a compost of peat, loam, leafsoil, and sand; grow in a warm, moist heat, and they will make rapid headway, and flower during the late autumn. Dipladenias approaching flowering will require liberal feeding if the best results are desired; before the flowers open look them over for insect pests, if these are present they will detract from the beauty of the plants Continue the propagation of poinsettias as cuttings are available, and pot on earlier batches before they suffer from being cramped in the small pots. Propagate fresh batches of tradescantia and panicum, fresh young pots being better for furnishing than older pots. Afford support by means of thin pieces of wire to the fronds of Adiantum farleyense, keep the fronds free from contact with each other as much as possible, if they crowd each other too much damping will follow.—J. TUNNINGTON, *Ripley Castle Gardens, Yorks.*

KITCHEN GARDEN.

At this season of the year, when many of the early vegetable crops are ready for use, or are approaching that stage, it is well to calculate how much of each kind of winter vegetable will be required to keep up a liberal supply during the winter, after making allowance for any mishap. Supposing, for example, that a note were taken of how much of each kind was used the previous year; and if there was a scarcity of any provision should now be made before the season is too far advanced to make up for any deficiency. Some of the green winter crops are not to be depended upon; for this reason it is always well to have others in reserve. Broccoli is one of these, for often in very severe winters many of the early ones get crippled to such an extent that the supply is considerably reduced. Broccoli in many places is a most unsatisfactory crop, but when well grown, and properly looked after, is always useful, as there are but few places where it is not in demand. To keep up a continuous supply from the time cauliflower is finished in the autumn, until that vegetable is again plentiful in spring or early summer, it will be necessary to plant several varieties that will succeed each other. There are the autumn and winter protecting, Snow's Winter White, Christmas White Vanguard, all cf which may be had in perfection during the winter, if a slight protection can be afforded them. There are so many varieties that turn in as soon as more genial weather visits us that it is not necessary to name them, but for late use Continuity, Late Queen, and Standwell are all good. A good breadth of savoys should also be put out, particularly from the late sowings, as these will be found most useful. Perfection is one of the finest of these that I have grown; it is not a large variety, but of most delicate flavour. Borecole should be planted wherever space will allow, as this vegetable is so hardy that the frost seldom injures it, and after a severe season is one of the most profitable vegetables we have. The asparagus varieties, such as Favourite are the best, as they will continue to give a supply of sprouts till Midsummer. Brussels sprouts should on no account be neglected, for it is surprising what a quantity of these may be gathered from a limited space when well grown. A good breadth of celery should also be got out, though for a late supply there will be ample time for this to make its growth if planted during the next month. Winter spinach ought on no account to be neglected, therefore when calculating the winter crops, a goodly portion should be allotted to this. To maintain an abundant supply, two or three sowings should be made. Turnips are also in great request during the winter and spring months, therefore when calculating the amount of space required for each of these crops, due regard must be had for those that are in the greatest demand, and that are likely to suffer the most from inclement weather.

Leeks also demand attention at the present time, for as these take a long season to bring them to perfection, they should be planted out without delay. If extra large roots are required, plant them a foot apart in the row. Parsley ought on no account to be left out of the list that demand attention at the present time. If a sowing be made now, and the plants therefrom transplanted in a sheltered situation when large enough to handle, these will usually withstand the cold of our winters better than plants raised from seed sown in the spring. Watering is one of those details in cultivation which should never be overlooked, for on this much depends whether the crop is a success or failure.—H. C. PRINSEP.

FRUITS UNDER GLASS.

Outdoor strawberries are very backward both in fruiting and in runner production this year and this makes it all the more necessary to lose no time in layering the first formed layers as fast as they become fit. Late seasons like the present accentuate the value of yearling plants put out in single lines solely for the production of runners and divested of their flower stems as the latter appear, as on such plants the runners are much more forward than those on fruiting plants besides being handier to work. I only know of one exception to the rule that early layering is best, and that is in the case of a strawberry which I value highly, viz., Vicomtesse Hericart de Thury; this is best left till mid-season, as early layers are apt to split up by autumn and form three or four small crowns instead of one good one, the ultimate result of this splitting being weak flower stems and very small fruits. There can be no doubt that the best method of layering for forcing plants is to use pots which may vary in size from three-inch to four-inch according to the strength of the particular variety grown. For instance, Vicomtesse Hericart de Thury and La Grosse Sucrée are best suited by three-inch pots, while Royal Sovereign and other strong growers should have a larger sized pot given them. The pots must be filled firmly to within half an inch of the rim with a good loam lightened with a small quantity of finely broken mortar rubbish. The surface soil should be finished off in a slightly conical form. In layering I make a slight groove in the soil with the blade of an old knife, and into this firmly peg the runner so that the embryo plant occupies the centre of the pot. The pegs I use are made from bracken, and I find these very handy as they shrink slightly before the next potting takes place and if not cut off too close above the hook they may then be easily withdrawn. Any kind of peg will answer the purpose, and pegs are preferable to the pebbles that are frequently advised. Each pot should be stood on a bit of slate, so that worms may be prevented from entering the soil. It is advisable to allow something like 10 per cent. over and above the number actually required, as losses or weak plants will occur, and must be reckoned with. At the same time, remember to layer a sufficient number into the soil or in pots to provide young plants for producing next year's runners. In choosing the runners see that they have not already begun to root, as such never make good plants. I like them best at the stage when the roots are just about to push, and layering before this stage is reached is no gain. Some growers layer directly into the fruiting pots, and this saves some labour, but is hardly advisable for general use, as the soil is apt to be soured if the season turns out a wet one; the older method is the safer. As regards varieties chosen for forcing, the advent of Royal Sovereign is likely to reduce the number greatly, as it has most of the attributes of a first-class forcing variety, its only defect being the need for staking, but this is necessary for many others. La Grosse Sucrée has proved good for many years, but I am discarding it this year, not without some reluctance, in favour of the last mentioned.

The time has now come when artificial heat in vineries should be reduced to a minimum or entirely suspended, and dependence be placed on early closing, with sun-heat to keep up the necessary temperature, but, unfortunately, although the season is here, cold nights and dull days have ruled up to the time of writing, so that fires are and will be necessary for houses containing grapes which have not yet taken their final swelling until better atmospheric conditions prevail. Early vines, from which the crop has been cut, should be syringed freely and daily to keep down red spider and other insect pests, and to preserve the foliage as long as possible in a green state. Plenty of air should also be given to the house night and day, and watering should not be neglected, as the vines will assimilate water in plenty in spite of the crop being removed. The above remarks on early vines will also apply to early peaches which have ripened their fruits, as any neglect in the way of syringing and watering will lead to premature ripening of the wood, which is an undoubted cause of bud dropping.—J. C. TALLACK, *Livermere Park Gardens.*

SOILS AND POTTING.

(Concluded from page 393.)

On a gentleman's place there is always a good deal of turf trimming to be done in spring time, grass edges to be neatly cut off around the walks, and borders straightened. By taking a generous slice where I dared, I usually managed to get together enough for the season's use. I am less ambitious now; if I get half a dozen cartloads of turf, I mix with it two loads of my best manure—sheep manure when I can get it. This I put in layers alternately with pure ground bone. The bone meal and sheep manure will start fermentation, and this chemical action is valuable in more ways than one. Soil heated to 120 degrees is fatal to all insect life and weed seeds, and further than this experience has shown that this chemical action is necessary to render bone meal available as a plant food. I have seen it used in a green state, but cannot say that I have been pleased with it; the odour is most disagreeable, and the mouldy condition which it assumes, which is, no doubt, a necessary stage of its transition from a crude into a soluble plant food, is, to say the least, unpleasant to look upon. Bone meal is slow in becoming available, but lasting when it is; it should be worked into the compost long before it is needed, as it is not fit for use until fermentation has subsided. It should never be applied as a top dressing. Before I knew this I thought it would be a good idea to scatter a layer of bone meal on the bottom of flats I was working up for young chrysanthemum plants. I intended they should have a good start and was, I suppose, too liberal, for in all my experience I never saw such a sickly lot of plants. I examined them every day and tried my best, hoping and believing they would come round. I waited almost too long. Finally I potted them in fresh soil, and when taken out of the bone meal compost I could almost have blown them over; how they managed to exist with so few roots is a mystery.

I said a light soil is best for potted plants, but this is only my experience; where a man must, perchance, get along with a heavy soil, and understands its management thoroughly, he may say as much in its favour. Two or three years ago my employer dug out a slough; he wanted mud, and also a place to dump gravel. This slough was found to be a depression in which for untold ages decayed leaves had gathered; the ground was spongy and too wet for general farming purposes. Little did we think to find black soil ten or twelve feet deep. It was piled up and valued only as swamp mud, but when it sweetened and vegetable life got a chance for possession we found that grass and whatever grew on it thrived luxuriantly, showing there was body in it. Though black in colour, it is light in weight and does not pack. I have grown geraniums, cinerarias, chrysanthemums, calceolarias, cytisuses, heaths, and azaleas in it, and all have done well. So it is; much must be gained by experience, and in no other occupation is one so much subject to his environment. All the functions of gardening go hand in hand; if we fail in one, we may fail in all. Injudicious watering of plants would lessen the value of the best compost; the lack of air and the requisite amount of heat and moisture would ruin the best plants.

To pot our plants properly is only part of the work; still "whatever is worth doing is worth doing well." Potting is like cooking a hare—"you must first catch your hare"; that is, see that you have clean pots and, if new, properly deodorised. Let me explain—gardeners know that plants seldom thrive in pots fresh from the kiln; exposure to the weathering influence of a rain-storm will sweeten them, or, lacking this, a good plan is to fill the new pots with moist earth and let it stay in them for a day or two; this earth should not be used. Next in importance to sweet, clean pots is good drainage. Crocks of broken pots are the best material to use. In healthy plants the bulk of the roots will be found among the drainage. Coal ashes are excellent for many plants, but they contain lime, and while this is a necessary ingredient in the food of some plants, it is not needed for all, and to some it is decidedly objectionable.

Plants which do the greater part of their growing during winter time, as well as those which remain a long time without repotting, require the greatest care. All potting thould be done firmly, and this for the most part can be done by the hand; it is seldom necessary to use the potting-stick in order to pack the soil more firmly, and then only for large plants and such as have solid balls of earth, as azaleas, heaths, and other shrubby greenhouse plants of slow growth.

A common practice among amateurs is to put out their window plants for a summer's growth. It is often a surprise and also a pleasure to watch such plants make luxuriant growth in their natural elements—free and unrestricted root area with plenty of air and sunshine. Usually their growth is altogether out of proportion to the space they must occupy for the winter, and it seems as if they would require much larger pots. If, however, as is generally the case, the greater number are of the zonal type of pelargonium, or what we know as geraniums, they will bear considerable hard treatment and may be roughly pruned in and much curtailed in amount of root room, and very likely will do as well as if more liberally treated. The same applies to almost all window plants. The disposition is to be far too generous with pot room. The conditions under which window plants must exist in living rooms are anything but congenial. I should prefer to dispense with my old stock after the summer's growth, having raised young stock in the meantime. The disposition to be generous is natural. It has always been regarded as "more blessed to give than to receive." One question the amateur is sure to ask is, "What fertilizer can I give my plants to start them up?" when all that is needed is better light and air, or more or less heat as the case may be. Artificial manures, no matter how attractively labelled, are sure to do more harm than good to window plants in winter time. If the plants are sick it will be owing to some other cause, and manures would only make them worse; it would be like trying to cure a dyspeptic with a course of high living.

A word or two on the use of artificial manures in the liquid form for potted plants may not be out of place here. It is intended by their use to increase growth and general productiveness whether it be fruits or flowers. More skill is required to continue a crop of flowers or fruits in productiveness after it has exhausted the natural resources of the soil than in bringing it to this condition; this is the mark of success with some men. It is not my intention here to name one [illegible] above another; there are a dozen good ones, only some are safer to use than others. One of the simplest and best is the drainage from the stable-yard. This contains in a highly concentrated form nearly all the constituents of a complete plant food; but even this cannot be used unstintingly. Some experience and good judgment will be required to gauge properly the amount which may be safely used in proportion to clear water. It is well to start with a one-[illegible] strength and increase it as experience dictates. I have used dry Colorado [illegible] manure, at the rate of a peck to fifty gallons, and this is the right to use without fining down. Sulphate of ammonia or nitrate of soda may be used at the rate of one pound to fifty gallons of water; these are really stimulants and not lasting manures. Their action is quick both of benefit as well as injury, and an overdose is a terrible trial for one to experience. These should only be used as alternatives. I am not skilled in mixing manures, but am satisfied to use one at a time. Liquid manures should be used only on plants making healthy growth, and the drainage must always be free.

EXHIBITIONS AND MEETINGS.

NATIONAL ROSE SOCIETY, BATH, June 23.

THE southern provincial exhibition of the N.R.S. was this year held at Bath, in the Sydney Gardens, in connection with the Bath Rose and Begonia Show; and certainly the N.R S committee could not have selected a more beautiful town than Bath for the show, or a nicer place than Sydney Gardens in which to hold it. The only disadvantage is the distance from the railway stations, but this is scarcely a great difficulty to overcome. Considering the lateness of the season and the many difficulties rose-growers have had to overcome, it was a matter of surprise, even to Mr. E. Mawley, the genial hon. secretary of the N.R.S., to see such a good display. Some of the roses were really very fine, and whatever can be urged against the early N.R.S. fixture, the Bath Show of 1898 will not help to displace it. There were entries in all but one or two of the twenty-seven classes, and though the competition was not keen in many, it was very close in others. The roses from Oxford were especially large and beautiful, and Mr. G. Prince had a good innings.

NURSERYMEN.

In the principal class for nurserymen, for forty-eight blooms, distinct, the silver cup offered by the Mayor of Bath, was won by Mr. B. R. Cant, Colchester, with a very fine set for this season, his blooms being fresh and even. In the back row were Ulrich Brunner, Kaiserin Augusta Victoria, Magna Charta, Rubens, Annie Laxton, Corinna, La Fraicheur, and Souvenir de S. A. Prince; middle row, Lady Mary Fitzwilliam, Suzanne Marie Rodocanachi, Souvenir d'un Ami, John Hopper, Jean Ducher, Jean Soupert, Marchioness of Downshire, and General Jacqueminot; front row, Mrs. W. J. Grant, Devoniensis, Marie van Houtte, Catherine Mermet, Madame Delville, Baroness Rothschild, Charles Lefebvre, and Anna Olivier. In the second box the flowers were: Back row, Madame Gabriel Luizet, Violet Bowyer, Margaret Baudet, White Lady, Dr. Andry, Niphetos, Gustave Piganeau, and La France; middle row, Marie Baumann, Madame Hoste, Caroline Testout, Maréchal Niel, Fisher Holmes, Hon. E. Gifford, Alphonse Soupert, and Cleopatra; front row, Dupuy Jamain, Souvenir d'Elise Vardon, Prince Arthur, Margaret Dickson, Madame Cusin, The Bride, Viscountess Folkestone, and Comtesse de Nadaillac. There were three competitors, and second prize was awarded to Messrs. D. Prior and Son, Colchester; Messrs. F. Cant and Co., Braiswick Nursery, Colchester, third.

Mr. George Prince, Oxford, took chief honours for twenty-four blooms, distinct, showing a fine set of flowers that were largely tea-scented varieties. The kinds shown were Lady Mary Fitzwilliam, Souvenir S. A. Prince, La France, Maréchal Niel, Niphetos, Marquis Lita, Medea, and Cleopatra, in the back row; Cornelia Koch, Marchioness of Dufferin, Princess of Wales, Jeannie Dickson, Comtesse de Nadaillac, Viscountess Folkestone, Kaiserin Augusta Victoria, and Bridesmaid, in the middle row; and Ernest Metz, Mons Furtado, La Fraicheur, The Bride, Rubens, Madame Cusin, Madame Hoste, and Lady Alice in the front row. Messrs. J. Burrell and Co., Cambridge, second.

There were but two entries in the class for twenty-four trebles, and in a close competition Messrs. D. Prior and Son, Colchester, succeeded in just beating Messrs. F. Cant and Co., of Colchester. The Messrs. Prior showed fairly good flowers, the varieties being Mrs. Sharman Crawford, Prince Arthur, Tom Wood, Madame Gabriel Luizet, Madame Hoste, Lady Mary Fitzwilliam, La Fraicheur, A. K. Williams, La France, Grace Darling, Fisher Holmes, Rubens, White Lady, Marie Van Houtte, Hon. Edith Gifford, Mrs. J. Laing, Mrs. W. J. Grant, Mrs. Harkness, Souvenir de S. A. Prince, Dupuy Jamain, Prince Camille de Rohan, Caroline Testout, Heinrich Schultheis, and Niphetos.

There were four competitors in the class for a dozen blooms of any rose except a tea or noisette variety, and here Messrs D. Prior and Son, Colchester, won first place with a capital lot of the sweetly fragrant Lady Mary Fitzwilliam; Mr. B. Cant, second, with Madame Gabriel Luizet; and Messrs. F. Cant and Co., third, with Lady Mary Fitzwilliam.

Mr. George Prince, of Oxford, was a good first for twenty-four blooms distinct, teas and noisettes; this was a first-rate stand, and contained good flowers of Princess of Wales, extra fine; Hon. E. Gifford, Souvenir d'un Ami, Alba Rosea, Madame Cusin, Medea, Souvenir de S. A Prince, and a lovely Comtesse de Nadaillac, in the back row; middle row—Niphetos, Rubens, Amazone, Cleopatra, Maréchal Niel, Souvenir d'Elise Vardon, Bridesmaid, and Innocente Pirola; front row—Maman Cochet, Madame Hoste, Catherine Mermet, Jean Ducher, Madame de Watteville, Marie van Houtte, The Bride, and Monsieur Furtado. Messrs. F. Cant and Co., second; and Messrs. D. Prior and Son, third.

The best dozen tea-scented roses came from Messrs. J. Burrell and Co., Cambridge, who showed a charming lot, containing Souvenir d'Elise Vardon, Cleopatra, Princess of Wales, Rubens, Bridesmaid, the Bride, Souvenir d'un Ami, Golden Gate, Madame Hoste, Sylph, Hon. E. Gifford, and Luciole; Mr. J. Mattock, New Headington, second; and Messrs. G. Cooling and Sons, Bath, third.

OPEN CLASSES.

The best set of twelve treble teas and noisettes came from Mr. G. Prince, who put up pretty flowers of Cleopatra, Innocente Pirola, Souvenir d'un Ami, The Bride, Mons. Furtado, Alba Rosea, Madame Cusin, Madame Hoste, Souvenir de S. A. Prince, Comtesse de Nadaillac, Hon. E. Gifford, and Princess of Wales; Mr. B. Cant second, and Messrs. D. Prior and Son third. There were seven boxes of twelve blooms, one variety, and here Mr. G. Prince gained another victory, this time with Maréchal Niel; Mr. B. Cant second, with fine flowers of Cleopatra; and Messrs. D. Prior and Son third, with Souvenir de S. A. Prince.

AMATEURS' CLASSES.

A splendid dozen tea and noisette roses won for Mr. Alexander Hill Gray, Beaulieu, Bath, the premier award—Cooling's silver cup, in open competition; his flowers were Souvenir d'Elise Vardon, Comtesse Nadaillac, Hon. Edith Gifford, Maman Cochet, Anna Olivier, The Bride, Princess of Wales, Maréchal Niel, Catherine Mermet, Marie van Houtte, Princess Beatrice, and Golden Gate; the Rev. J. H. Pemberton, second; and Dr. S. P. Budd, Bath, third.

Mr. Alexander Hill Gray, Beaulieu, Bath, gained first prize for two dozen blooms, distinct, his collection containing good flowers of Marie Van Houtte, Jean Ducher, Madame Hoste, Madame Lambard, Rubens, The Bride, Maman Cochet, and Hon. Edith Gifford. Dr. Budd was second, and Mr. T. H. Catley, Claverton Buildings, Bath, third. Dr. S. P. Budd, Gay Street, Bath, gained a first prize for six trebles, and was the only exhibitor in this class, showing Catherine Mermet, Madame Cusin, Marie Van Houtte, Countess of Pembroke, The Bride, and Princess of Wales.

In the class for a dozen blooms, open to growers of less than a thousand plants, the only exhibitor was the Rev. R. Powley, Upper Scudamore, Warminster, who had very fair blooms of Marquise de Castellane, Niphetos, Souvenir de T. Levet, Kaiserin Augusta Victoria, and Catherine Mermet. Mr. Harcourt P. Landon, Brentwood, Essex, secured first prize for half a dozen blooms, distinct varieties, with fresh examples of Comtesse de Nadaillac, Madame Cusin, Souvenir d'Elise Vardon, Niphetos, Souvenir d'Un Ami, and Catherine Mermet; Mr. L. Parry, Stinsford House, Dorchester, was second.

The only exhibitor in the class for eighteen distinct varieties of teas and noisettes was Mr. A. Hill Gray, whose charming flowers were Maman Cochet, Anna Olivier, Princess of Wales, Souvenir d'un Ami, Caroline Kuster, Souvenir d'Elise Vardon, Innocente Pirola, Comtesse de Nadaillac, Souvenir de S. A. Prince, Cleopatra, Alba Rosea, Medea, Ernest Metz, Marie Van Houtte, The Bride, Souvenir de Therese Levet, Hon E. Gifford, and Maréchal Niel.

In the section for growers of less than five hundred plants, the best twelve blooms were shown by Mr. Conway Jones, who had fair-sized blooms of Golden Gate, Maréchal Niel, Souvenir d'Elise Vardon, Cleopatra, The Bride, Souvenir d'un Ami, Souvenir de S. A. Prince, Niphetos, Marie van Houtte, Hon. Edith Gifford, Catherine Mermet, and Madame Hoste. Mr. Conway Jones secured the Prince Memorial Cup with this set, and the Rev. J. H. Pemberton, Havering, Essex, came second. In the class for growers of less than two hundred plants, Mr. Joseph Smith, East End House, Warminster, won a first prize.

The best six trebles came from Mr. A. Hill Gray, who showed in fine style throughout, and staged elegant blooms of Maréchal Niel, Comtesse de Nadaillac, The Bride, Princess Beatrice, Anna Olivier, and Catherine Mermet; Mr. Conway Jones, Gloucester, second. Mr. Conway Jones came first for six blooms of one variety with Maréchal Niel; Mr. A. Hill Gray, second; and Mr. G. Smith, Warminster, third.

GARDEN ROSES.

The chief award in the class for thirty-six distinct varieties of garden or decorative roses was won by Messrs. G. Cooling and Sons, Bath, who put up a magnificent display of huge bunches. The varieties were Yellow Austrian Briar, Rosa rugosa delicata, W. A. Richardson, unnamed var., Persian Yellow, Bardou Job, Janet's Pride, Cooling's Yellow Noisette, Lucida plena, Claire Jacquier, Papa Gontier, Rugosa fimbriata, Abbe Thomasson, Madame Eugène Resal, Beranger, Purity (a new bourbon), Marquis of Salisbury, Macrantha, Blanche de Courbet, Gustave Regis, Laurette Messimy, Homere, Tuscany, Papillon, Gloire de Rosamanes, Etoile de Mai, Blanche Moreau, Madame A. Carriere, Duchess d'Auerstadt, Crested Moss, Ma Capucine, Hebe's Lip, Harrisoni, Red Provence, Morletti, and Domelie Boccard. Messrs. Paul and Son, Cheshunt, gained the second prize.

Mr. Charles Turner, Slough, secured the first prize for eighteen distinct varieties of garden roses, showing fine sheaves of Janet's Pride, Fimbriata, W. A. Richardson, Cabbage Provence, Anna M. de Montravel, Madame S. Ducher, Mignonette, Blanche Double de Courbet, Blairi No. 2, Bardou Job, Rose Apples, Madame Plantier, De Meaux, Reine Olga de Wurtemburg, Common Moss, Gloire des Polyanthes, Madame G. Bruant, and Pomifera; Messrs. F. Cant and Co., Colchester, second; and Mr. J. Mattock, New Headington, third. Messrs. Paul and Son, Cheshunt, won the chief prize for twelve bunches of single-flowered roses, making a charming display with Ormissa, Rugosa, Rose Bradwardine, R. Nutkænsis, Royal Scarlet, Lady Penzance, Paul's Single White, R. Carolina, Paul's Carmine Pillar, R. macrophylla, Rugosa alba, and Pomifera; Messrs. G. Cooling and Son, Bath, second; Mr. C. Turner, Slough, third.

In the amateurs' section a capital set of eighteen bunches of garden or decorative roses was arranged by the Rev. J. Pemberton, in a class for not less than three trusses of each variety; the group had to be staged on a space six feet by three feet. Mr. Pemberton won first prize, and was the only competitor, but he would have taken a lot of beating. His set comprised fine bunches of White Scotch, R. multiflora grandiflora, Reine Olga de Wurtemberg, Madame George Bruant, Claire Jacquier, R. multiflora simplex, Janet's prize, Paul's Carmine Pillar, W. A Richardson, Madame Alfred Carriere, Cecil Brunner, Rosa macrophylla, R. alba, Gustave Regis, R. pomifera, Marquis of Salisbury, Paul's Single White, and Madame Falcot.

Mr. E. Mawley, Berkhamstead, won first prize for six bunches of garden roses, distinct varieties, showing pretty bunches of Janet's Prize, Carmine Pillar, Madame G. Bruant, Laurette Messimy, Madame Plantier, and William Allan Richardson.

MEDAL ROSES.

Messrs. A. Dickson and Son, Newtownards, co. Down, gained a gold medal for their new hybrid tea rose, named Miss Bessie Brown; this is a large round-petalled, soft, creamy-white variety of beautiful shape and good size; the firm also showed good examples of Daisy, Countess of Caledon, Tom Wood, in fine condition, Ulster also very good, and Mrs. E. Mawley.

The silver medals for best blooms in the show were awarded as follows: Nurserymen—Messrs. Burrell and Co, Cambridge, for H.T. Lady Mary Fitzwilliam; to Mr. G. Prince, Oxford, for T. Comtesse de Nadaillac; to Messrs. Alexander Dickson and Sons, Newtownards, for H.P. Tom Wood. Amateurs—to Mr. A. Hill Gray, for T. Maman Cochet; to Dr. Budd, for H.P. Alphonse Soupert; and to Rev. J. H. Pemberton, for H.T. Caroline Testout.

BATH SHOW CLASSES.

In the local class for a dozen roses distinct, the first prize-winner was the Rev. Yorke Fauset, who was closely followed by Mr. R. B. Cater, Westfield House, Bath. Mr. J. Mattock staged the best basket of roses, a pretty arrangement in pale yellow and cream-coloured rose buds; Mr. C. A. Smith, Bathhurst Hill, Bath, second.

In a local class for a table of roses arranged with a groundwork of ferns and moss there was but one exhibitor, Messrs. Cooling, of Bath, worthily gaining the prize with a charming arrangement of long and elegant growths of the yellow Rosa Harrisoni and various varieties of the Penzance sweetbriars; beneath these were light, but dwarf sprays of popular garden roses, almost all being tea varieties. This table was very pretty, and some such class as this should be instituted at all rose shows.

Mr. W. A. Hick, Batheaston, had the best six bunches of garden roses, while Mrs Stothert, Audley Park Gardens, was second. Mr. J. Hinton, Batheaston, was also a successful local exhibitor. For a dozen rose bouquets, Messrs. E. Cole and Son, Bath, gained the place of honour with a tasteful exhibit. Mr. Allan Smith, Bathurst Hill, was first for six rose bouquets.

There were no less than five groups staged for the substantial prizes offered by the Bath Committee. Each group was to occupy a space of two hundred and fifty square feet, consequently there was scope for artistic effect. Mr. J. Cypher, Cheltenham, won first prize with a pretty arrangement of caladiums, orchids in great variety, crotons, palms, ferns, Rex begonias, &c. The central arch of cork and moss, laden with drooping Cattleya citrina, Odontoglossum crispum, O. citrosmum, and O. Pescatorei, was much admired, as also were the fine forms of Cattleya Mossiæ in the groundwork below. Mr. Tanzer, gardener to R. B. Cater, Esq., Bath, came second with a group in which the blue agapanthus and white francoa were tastefully associated; Messrs. E. S. Cole and Son, Bath, third.

The class for a table of plants is interesting, but it seems to serve no useful purpose, as plants over two feet high are not admitted. Mr. Cypher, Cheltenham, was easily first with an arrangement of cattleyas and odontoglossums, Mr. Tanzer second, and Mr. F. J. Tate, gardener to Mrs. Stothert, third.

There were a number of extremely pretty table decorations, and the first prize was won by Miss N. M. Ellwood, with yellow and white poppies, a very pretty table; Miss A. M. Freeman, second, with a table of blue irises, bluish sweet peas, and marguerites.

NON-COMPETITIVE.

A beautiful bank of cut hardy flowers was put up by Messrs. Barr and Sons, Covent Garden. Not only was the display a large one, but it consisted of very fine bunches of flowers; pæonies were extensively shown, and in wonderful variety. The delphiniums were first-rate, and so were the numerous irises, among which we made special note of the Spanish varieties Thunderbolt, Lemon Queen, Vasco de Gama, Othello, and Blue Beauty. Other charming irises were I. juncea, I. ochroleuca gigantea, I. siberica, and I. s. alba. Philadelphus Lemonei and the varied forms of Papaver bracteatum were specially noticeable and good.

Messrs. R. Veitch and Son, Exeter, had a fine exhibit, consisting of new plants, such as Acalypha Sanderi and A. Godseffiana; they also had a miniature rockery with erigerons, campanulas, hieraceums, prunellas, saxifragas, &c., growing and flowering freely. Bunches of cut hardy flowers were used to flank the rockwork and the display of Marliac's lilies. About twenty varieties of bamboos, including B. Boreana and B. nobilis, were staged, and in the exhibit were examples of such interesting plants as Poinciana Gillesi, hardy in the south of England, and recently flowered in the Isle of Wight; Phyllanthus Crippsi, Senecio Petasites, Cineraria Heritieri, Convolvulus althæoides, and Edwardsia Trapha. The Messrs. Veitch showed a splendid set of photographs of rock gardens and parks laid out by them.

Pæonies in variety, and a few stands of first-rate show and fancy pansies, were staged by Mr. F. Hooper, Widcombe Hill, Bath; some good specimens of violas in pots were also shown by Mr. Hooper. Mr. J. H. White, Worcester, showed an extensive collection of pæonies and other hardy flowers. Mr. W. F. Gould, Bath, had an interesting display of cacti and succulents, showing large opuntias, cereus, mammillarias, echinocacti, echinocereus, &c., many of the species carrying flowers.

COLCHESTER HORTICULTURAL SOCIETY, June 16.

THE annual summer exhibition of this enterprising society was held on the above date under the most favourable climatic conditions, and was in other respects a great success. As in previous years, the exhibition was held in the grounds of East Hill House, the residence of C. E. Egerton-Green, Esq., which are not only exceedingly beautiful but are conveniently situate on the outskirts of the town, and the attendance, we are pleased to say, was a record one, some three thousand visitors having been present. In consequence of the lateness of the season roses were not so numerous as in previous years, but other products were fully up to the average, and the three huge marquees were well filled, and the competing collections generally were of a high order of merit.

ROSES, as will be readily understood by those who appreciate the importance of the rose industry at Colchester, receive prominent attention, and in ordinary seasons they constitute a glorious feature of the society's summer exhibition. This season the date was too early to enable the Colchester rosarians to even indicate their strength, with the result that the premier awards in several of the more important classes were obtained by growers in the more southern parts of England. In competition for the prizes for thirty-six single roses, Mr. George Mount, Canterbury, obtained premier honours with an excellent collection, the blooms well developed and bright in colour. Messrs. D. Prior and Sons, Colchester, followed for second place, and Mr. B. R. Cant, Colchester, was an uncomfortably close third, with blooms, for so late a season, of high quality. The teas and noisettes in the trade class for twelve blooms were remarkably good, and at the head of the several competitors was Mr. George Prince, Oxford, who had a collection of superbly developed blooms, especially noteworthy in the box were: Souvenir d'un Ami, which was selected for the award of the silver medal for the best rose in the trade classes, and Cleopatra, the last-named being the finest bloom of this beautiful variety that has yet come under our notice at a public exhibition. There was a brisk contest for the prizes for twelve garden or decorative roses, and the collections of tastefully-arranged bouquets of flowers produced a beautiful display. Here Messrs. Frank Cant and Co., Colchester, obtained premier honours, and Mr. B. R. Cant, and Messrs. Paul and Son, Cheshunt, were second and third respectively, the whole of the prize winners having good stands, although differing in relative merit.

The amateurs' classes were less satisfactorily filled than were those in which the competition was limited to nurserymen. In the class for eighteen trusses Mr. R. E. West, Reigate, was the only competitor, but the blooms he staged fully justified the premier award that was made in his favour. Chief among the other successful competitors in the amateurs' division were Mr. H. G. Egerton-Green (gardener, Mr. F. Kettle), King's Ford; Mr. John Carter (gardener, Mr. W. Carter), Mill House, Halstead; Mr. L. Daniel Bergholt, Dr. Nicholson, Colchester; Rev. J. H. Pemberton, Mr. A. Cant, Mr. O. G. Orpen, Hon. W. Lowther (gardener, Mr. A. C. Light), Campsea Ash; and the Rev. A. C. Johnson, Capel St. Mary. Mr. H. Egerton-Green was successful in taking both the silver medals offered for the premier blooms in the amateurs' division, the medal tea or noisette being Maréchal Niel, and the medal bloom other than tea or noisette, Alfred Colomb.

CUT FLOWERS, other than roses, constituted a large and highly attractive feature. In competition for the prizes for twenty-four bunches of hardy herbaceous plants there were four or five collections all more or less good. Messrs. J. Burrell and Co., Cambridge, were first with a collection equally remarkable for the high quality of the flowers staged and the taste with which they were arranged. Mr. R. C. Notcutt, Woodbridge, was second with a fine collection two or three points behind, and Mr. C. Jacobi, Ipswich, was a very close third. Messrs. R. Wallace and Co., Colchester, had a noteworthy collection, in which Incarvillea Delavayi and Lilium rubellum were represented. Equally spirited was the competition in the class for twelve bunches of hardy flowers, open to amateurs only, and the first prize was awarded to Mr. H. Egerton-Green; the Hon. W. Lowther was second and Mr. O. G. Orpen, West Bergholt, a close third. Lady Du Cane, who failed to conform to the regulations by staging more than one variety in several of the bunches, was awarded an extra prize. The exhibitor last named occupied the post of honour in the class for a collection of flowers of bulbous plants, and Mrs. A. Cant was first for six bunches of hardy herbaceous plants. Sweet peas were well shown by Dr. Salter; D'Arcy and zonal pelargoniums by J. Round, Esq., M.P. (gardener, H. Bishop), Birch Hall, Mrs. A. Cant, and Mr. G. B. Halls. Irises were especially good, and it was no easy task to determine their relative merits. Lady Du Cane obtained premier honours with an excellent collection arranged somewhat naturally in rather large bowls surfaced with moss; Mr. H. Egerton-Green and Dr. Nicholson were second and third with capital collections.

FLORAL ARRANGEMENTS had a large tent wholly devoted to them, and included numerous vases evincing much taste. The decorated dinner tables were so thinly furnished with flowers as to display but little beyond the table cloth, and, consequently, failed to contribute much to the attractions of this department. The most successful of the exhibitors of dinner tables were Mrs. R. W. Wallace, Miss Moore, Miss A. F. Harwood, and Miss M. Scott. In the classes for vases and epergnes the principal awards were made in favour of Mrs. A. Cant, Miss Leaning, Miss L. Cant, and Miss Beard.

FRUITS AND VEGETABLES were not largely shown, but the quality of the produce was generally high. Lady North (gardener W. J. Trott), Little Glenham Hall, was successful in taking the first prize for black grapes with Black Hamburgh, and in the corresponding class for white grapes, Mr. W. Norton (gardener, H. Cook), Langham Hall, had the premier award made in his favour. The Hon. W. Lowther had the best dish of peaches, the best melon, and the finest flavoured strawberries. The latter were small fruits of British Queen but exceptionally high in flavour. Mr. J. Brittain (gardener Mr. T. Finch), Giffords Hall, Stoke, was second in the class for strawberries for flavour, with handsome fruits of British Queen. In the corresponding class for strawberries for weight, Mr. T. Martin was first with Royal Sovereign.

In the vegetable classes Mr. H. Egerton-Green, Mr. W. Lowther, and Mr. Round, M.P., were the prize takers for collections of eight kinds open to private growers, and in a similar class for market gardeners Mr. A. Burrows, Mr. Frank Chapman, and Mr. W. Goodwin were awarded the prizes in the order of their names. Asparagus was, as usual, staged in large quantities and high quality; and there was a strong competition for the silver challenge vase presented by Mr. G. Munro for three bundles of one hundred heads each was awarded to Mr. W. J. Godfrey for produce that fully justified the high reputation "Colchester grass" enjoys in the markets, as, indeed, did the whole of the produce in competition. For one hundred heads, Mr. D. Stowlger, Mr. R. T. Daniell, and Mr. F. Chapman were first, second, and third respectively with splendid produce.

PLANTS have comparatively few classes provided for them, but they were as usual, contributed in sufficient numbers to form an attractive feature. Groups arranged for effect were a strong feature, and the premier award was made in favour of Mr. H. Egerton-Green, and Messrs. Bunting and Sons and Mr. W. Draper were second and third respectively. Tables of plants were contributed by Mr. H. Egerton Green, Mr. J. Round, M P., and Messrs. Bunting and Sons; and the prizes were awarded in the order in which the names are here placed.

The arrangements were remarkable for their completeness, and much praise is due to Mr. O. G. Orpen, the energetic honorary secretary, and other members of the executive.

READING AND DISTRICT GARDENERS' MUTUAL IMPROVEMENT ASSOCIATION.

The second meeting of the summer session of the above was held in the club room on Monday evening last, when Mr. Turton, the chairman of the association, presided over a good attendance of members. The subject chosen for the evening was "Vegetables in Season," introduced by Mr. H. Wilson, gardener to Mrs. Bland-Garland, Lower Redlands, Reading. The kinds principally touched upon were asparagus, cabbage, carrots, mushrooms, tomatos, turnips, French beans, vegetable marrow, peas, lettuce, broad beans, cucumbers, and potatos. A most profitable discussion took place, some fifteen to twenty members giving their experience with regard to the various kinds referred to. The exhibits were exceedingly interesting, Mr. Townsend, gardener to Sir William Farrer, Sandhurst Lodge, showing a splendid collection of tropical and hardy nymphæs, amongst which were the following: stellata, Amazonica, lotus, Zanzibariensis, Z. rosea, elegans, pygmæa, helvola, Leydeckeri rosea, tuberosa alba, candida, Marliacea carnea, M. chromatella, odorata gigantea, &c.; Mr. Wilson, considering the backwardness of the season, had some excellent specimens of Sutton's First Crop cauliflower, Snowball turnip, Champion Horn carrot, Commodore Nutt and Tom Thumb cabbage lettuce, black-seeded Bath cos lettuce; Mr. Turton, Maiden Erlegh Gardens, a splendid sample of Sutton's Ringleader potato; Mr. Smith, gardener to Miss Nield, Greenbank, nine bunches of pansies, distinct varieties; Mr. Osborne, jun., a plant of streptocarpus, a cross between Wendlandi and the hybrid strain. A vote of thanks to Mr. Turton and to those who had staged the flowers and vegetables brought an enjoyable evening to a close.

HORTICULTURAL CLUB.

THE last monthly dinner and conversazione for the season took place on Tuesday, June 14. As usual at this time the attendance was not as numerous as it generally is. The chairman of the club, Sir J. D. T. Llewelyn, Bart., M.P., occupied the chair, and a very interesting lecture was given by Mr. C. T. Denery, V.A.H., on "Fern Variation in Nature and Culture." The lecture was illustrated by some remarkably beautiful illustrations of Nature printed ferns by the late Colonel Jones. It gave rise to an animated discussion, and a cordial vote of thanks was accorded to the lecturer. The annual excursion of the club was fixed for July 19, of which members will receive full particulars in due course.

A Queer Potato story comes from Michigan, where, according to a highly imaginative journalist, a market gardener has been cultivating his potatos out of reach of the potato-bug by grafting a poplar tree with potato peelings. So far the matter is only through the trial stage, but the trial was so successful that by the end of April the enterprising grower obtained a fine crop of potatos about the size of small goose eggs; the yield was estimated at three and a-half bushels. The writer's imagination did not held out long enough for him to state whether his potatos were rounds or kidneys; whether he dug the crop, or picked it like fruit; or whether the annual grafting is likely to be necessary. In fact, the report is entirely lacking in those details necessary to render it of value to horticulturists.

American Vines in Sardinia.—The province of Cagliari, which contains the richest and most extensive wine regions of the island of Sardinia, has remained free from the invasion of the phylloxera, but, nevertheless, the wine growers and proprietors of vineyards are still menaced by this dreadful calamity: and, in order to keep off the pest and take all the necessary measures to that effect, the director of the School of Viticulture has commenced to recommend most warmly the introduction and cultivation in Sardinia of the American vines. In order to further his views, some important lectures were recently given at the school, attended by a large number of school teachers from the rural districts, who have been requested to utilise the practical knowledge acquired thereby. The fear of the invasion of Sphæroderma damnosum pre-occupied all agricultural proprietors in Sardinia during 1897, says Consul Pernis, and, though the malady has now been checked, the fear has not entirely ceased.

A JOURNEY TO THE FORESTS OF CENTRAL AFRICA.

MR. JOHN MAHON, who was appointed last year Forester in Zomba, British Central Africa, sends to *Journal* of the Kew Guild the following interesting account of his journey to that Colony :—

The Editor has kindly invited me to write an account of my journey to, and impressions of this remote outpost of the British Empire. I left London in June last *en route* for Durban, Natal, where we were enabled to spend several enjoyable days. With all its dusty storms, I must say "That Durban is a pleasant place to me, who loves to see the sun shine every day, and flowers, not nailed to walls, festooned from tree to tree." The beautiful Botanic Garden, the parks and squares, the town hall, and many other features of interest impressed me much. I left Durban with three other officials (two of whom were doctors), and in process of time we entered Delagoa Bay. Further on came the rising port of Beira, the natural port of Mashonaland, and likely to be a great place in time. Then we called at Inhambane—where the copal comes from—and eventually Quilimane, where it may be said the cocoanuts come from, for there are quantities of the palm about that beautiful, red-tiled, gaily painted river-port. We trans shipped again and sailed south for a day, when we reached Chindé, the port of British Central Africa, on the Chindé river—one of the numerous mouths of the Zambesi, and the gate of a direct waterway to the lakes. The Portuguese own Chindé, but the British Government has a small concession of wharfage on a ninety-nine years' lease. It is a lamentable place, consisting of a sand-pit backed by the raggedest, nastiest bush imaginable. We spent six wretched days there before the African Lakes' steamer came and carried us to the famous broad Zambesi proper, which at this point is very imposing and charming. The banks are lined with a dense and varied forest—trees of the mangrove type predominating. Such tropical features as orchids, climbers, birds, butterflies, and strange animals, may have been there, but none of us saw them. A day's journey disgusted us with the river, for the forest thinned away into the distance and we were left with grass-lined banks (and dead grass at that), and for miles one saw nothing but the river and the glaring sun above, often through reeking smoke, pungent and unpleasant, from the incessant grass-fires, at this season raging all over the south and central regions. The monotony was broken by the vessel lodging every little while on a sandbank, when the nigger crew had to get out and pull her off. At the Portuguese mission-station—Shupanga—we went ashore to visit Mrs. Livingstone's grave. After several days we struck into the Shiré, which wends away amongst hills in a north-easterly direction. Now the banks were clothed with luxuriant verdure, with hills in the background ; the river ran swift and clear, and generally it was a glorious relief after the flat, ugly Zambesi country. The Shiré may justly be called the River of a Thousand Islands. They are thick in it ; beautiful green, flowery spots, for the soil is rich and there is abundance of magnificent land. Cacao, spices, sugar, tobacco, and Liberian coffee should grow well there. As it is, the banks are most interesting to the botanist, for there were many gay flowering plants. A scandent shrub, which bore a wealth of broad, flaky masses of small scarlet flowers, reached up to the highest trees, and, blended with foliage and sky-effects, reminded one of a Japanese picture. Phœnix reclinata was very much *en evidence* and also Hyphæne, of which there are frequently forests, till one wearied of its straight stem and big round head like a gigantic mop. Crocodiles are bigger and more numerous here than on the Zambesi. We counted eight large specimens on a bank one day. We blazed away at the brutes all the time, and I cannot help doubting but that travellers since must have noticed a delta of dead crocodiles at the junction of the Shiré and Zambesi. As for the hippopotami, you fire point blank at their big, soft heads, which bob below momentarily, only to bob up again a few feet off and calmly wink at you. There were flocks of lovely birds, snow-white graceful egrets, fish-eagles, guinea-fowl, &c., and at times a gregarious bird (*Merops natalensis*), the size of a thrush, with all the colours of the rainbow (and I think one or two more) in his coat, that made the high banks, where they nest like martins, a glorious mass of colour.

A smaller steamer brought us in two days to Chikwawa and to the end of our water journey. From thence we were carried in a kind of hammock called a *machila*, slung on poles of the native bamboo (Oxytenanthera abyssinica), to Blantyre, a distance of forty miles. The road at once begins to ascend the hill, and the invigorating feeling as we mounted higher was very delightful after our long lowland travelling. It stretches away to the Lakes, and has many ramifications. The section to Zomba (about one hundred miles) is an excellent one for bicycling. With eight or ten carriers, a day's journey landed us at Blantyre, the commercial capital of the Protectorate, a straggling place amongst the hills. After a day's stay in Blantyre we proceeded *en route* for Zomba, forty miles away, which we did in a four-muled cart.

Zomba is the name of a mountain-chain running east and west for a distance of five miles or so. The highest peak is about six thousand feet altitude. The Government head-quarters, dwellings, &c., occupy a south aspect at the base, on the banks of a lovely, deep mountain stream; about three thousand feet above sea-level. Looking southwards from Zomba, a vast plain stretches before one, dotted with hills of many sizes. The mornings here are always sweet and refreshing, heralded by the Zomba thrush (*Turdus zombensis*), whose short, rippling notes resemble those of our own songster. Every day almost there is a breeze, and in the rains it often gets quite cool. In the dry season Zomba almost to a man goes up on the hills for the "week-end" to camp and shoot buck, wild pig, and a kind of grouse. Your hardier spirits betake themselves to the plain to wage war with eland, kudu, zebra, leopard, and possibly lions.

The native of these regions is a peculiar specimen of the human race. He excels in laziness and indifference to creature comforts, especially cleanliness. If he plunges into a stream at times, it is for a cooler. He has no ambition. He will go a forty-mile journey with a load of fifty pounds on his head, and for food take only two or three cobs of maise, which he toasts on a fire ; water is close by to quench his thirst, and he is quite content.

The climate is responsible for strange incongruities as regards plant-life ; for instance, here in the Residency grounds at Zomba, Allamanda violacea, Plumeria alba, and Lawson's cypress are quite happy side by side. Mangoes flourish exceedingly, but refuse to bear. Bananas and pineapples are quite at home. The Citrus family in the few places they have been grown are only a very partial success, whilst in Natal they thrive wondrously. The essentially tropical West-African forest-tree, Khaya senegalensis, reaches magnificent proportions by stream-sides, whilst the Blue Gum never looks happy. Fighting with tropical grasses, climbers, and what not, you see the dear old "bracken." Beaumontia grandiflora luxuriates, whilst by a streamlet near at hand a buttercup, as near our own meadow flower as need be, is equally happy. A lot of Mauritius hemp is just "poling" ; bougainvilleas are "rampagious" ; Clerodendron Thompsoniæ, Maréchal Niel rose, and Cissus discolor are fighting for priority on a small arch ; and a few paces away an apple tree looks much the same as it does at home, only it will not flower.

ANSWERS TO CORRESPONDENTS

Editorial communications should be addressed to the Editor of the GARDENERS' MAGAZINE, 148 and 149, Aldersgate Street, E.C.

The Editor will be glad to receive photographs of gardens, plants, flowers, trees, fruits, &c., for reproduction in the GARDENERS' MAGAZINE. He will also be greatly obliged by correspondents sending early intimation of interesting local events relating to horticulture. In sending newspapers containing matter to which they wish to draw attention, correspondents are requested to distinctly mark the paragraph.

Specimens of plants, flowers, and fruits for naming or opinion should be sent to the Editor of the GARDENERS' MAGAZINE, "Endsleigh," Priory Park, Kew, Surrey, and as early in the week as possible. All parcels must be sufficiently prepaid.

Secretaries of horticultural societies are invited to send early notification of forth coming exhibitions and meetings, and are requested to advise us concerning change of dates.

Address.—R. B., Great Yarmouth : The address you need is 1, Danes' Inn, Strand, W.C.

Concrete for Garden Walk.—W. B., Henley : Obtain sufficient quantities of well-screened gravel and clean river sand, and use these in equal proportions ; to five parts of the sand and gravel mixture add one part of Portland cement, then mix with sufficient water, and apply the concrete two inches thick.

Warty Vine Leaves.—S. C. : The peculiar warty excrescences seen on the vine leaf sent are due to a superabundance of sap in the vines. This results from the roots being in a cold border, and to lack of heat and sufficient ventilation in the house. Increase both the temperature and ventilation, and next autumn see what can be done to improve the condition of the border.

Variation in Pansies.—J. H., Somerset : It is by no means an uncommon thing to see two differently coloured flowers upon the same plant of a seedling pansy, but it invariably happens that the arrangement of the markings is the same in both cases, as in the two flowers sent. One flower shows a greater likeness to its parent than the other, and the only real difference is that of complexion, and that not a great one.

To Remove Putty from Garden Lights.—R. A. H., Retford : The glaziers usually remove the putty from glass lights by means of a hammer and hacking-knife. In unskilled or uncareful hands the use of these tools often results in the breakage of a good deal of glass, besides the splintering of the wood bars. A hot iron is very useful to soften hard putty, and if it is shaped somewhat like a soldering-iron but with a long flat side it will be all the better. Do not touch the glass with the hot iron, and if one heating is insufficient, try again, and the putty will then be so soft as to be removable with the fingers.

Mildew on Vines.—R. W., Southants. Cold draughts are the chief causes of mildew, and with the fluctuating temperature produced by the heat of an underground bakehouse, it is most probably that large volumes of cold air have been admitted at times to reduce the heat. Sulphur dusted over the affected parts is the best remedy, but it should be applied freely as soon as there are any signs of the attack. Portions of the wall that become heated considerably should be painted over with a mixture of sulphur and skimmed milk. Give air carefully, and especially when there are cold winds blowing. Give the vine border a dressing of Clay's, Thomson's, or other suitable fertiliser and water it in, an alternative will be a good soaking with fairly strong farmyard liquid.

Coltsfoot and Moss.—H. B., Prescot : Fork out all the coltsfoot you possibly can, but where the present crop will not allow of this being done, use the Dutch hoe freely. No plant can live for long if its foliage is persistently removed, consequently any weed can be kept at bay and subsequently killed by persistent Dutch hoeing during hot or dry weather. With regard to the moss on the walks, there are several remedies ; the weed-killers advertised in our columns will soon effect a clearance and improve the appearance of the paths. Strong brine applied as near the boiling point as possible, or a mixture of oil of vitriol and water, at the rate of one pound of the former to ten quarts of the latter, are other weed-killing mixtures, but they require to be carefully used, especially where there are grass verges to the walks, for what will kill the moss will also kill the grass. Moss on walks and lawns is generally considered evidence of imperfect drainage.

Roses for Market.—J. E. Patricroft : It is not an easy matter to say which are the best roses for market because fashions change frequently, and a rose that sells readily one season may not be much in request the next. Fortunately, roses are not so subject to the fluctuations of fashion in this country as elsewhere, and so we are able to give a general answer to your question. You have omitted to give us any information with regard to position of the house and the heat at command ; presuming these to be favourable, the following will prove to be among the best roses for the supply of good roses : Mrs. J. Laing, La France, Catherine Mermet, Ulrich Brunner, Captain Hayward, The Bride, Niphetos, and Maréchal Niel. You should try the new perpetual-flowering Enchantress, creamy yellow, and if you could succeed with Fortune's Yellow it would yield a wonderful crop of yellow, apricot-shaded blooms. Other roses do well under glass, but those named are among the best, and their flowers are always popular.

Wood-lice or Sow-bugs.—H.W.R., Barnes : Wherever wood-lice have become plentiful they are a great pest, especially in pits and glass-houses. If it is at all practicable boiling water should be used for the destruction of the pests, but where this cannot be used owing to the danger of injury to roots of cucumbers, melons, &c., you will have to exercise a good deal of persistence to get rid of the enemy. Toads and tomtits will help you if you allow them, indeed a little colony of toads will prove invaluable. As traps, use cold potatos, cut, and placed in a small flower-pot ; cover the potato with dry moss, and lay the pot on its side in a quiet corner. Examine these traps at night as at such a time the wood-lice are feeding ; a pail of hot brine will serve to settle them. Little heaps of lettuce leaves, fresh brewers' grains, and young cabbage leaves will also serve as traps, but they must be frequently examined during dusk or dark, otherwise the woodlice will have had a feast and returned to cracks and crevices whence they cannot easily be ousted.

Cauliflowers Going Blind.—J. R. G., Leeds. We cannot say with certainty what is the cause of "blindness" in your cauliflower plants, as we do not know the conditions under which they have been grown. Where the seed has been sown very thick and there has been no thinning out of the plants until planting time, there is always a large percentage of plants that have no growing point. Possibly the planter did not examine the plants, ere planting, with a view to using only those that were likely to make good progress. Where seedlings are allowed to remain thickly in the seed bed, they also need a good deal of water and so probably drought as well as crowding had something to do with blindness. Then again, such plants have little stamina, and so, should unfavourable weather occur about planting time they fail, either by collapsing or going blind.

Names of Plants.—Under this heading we can only undertake to name species and specific varieties of plants, and not florists' flowers. Specimens should be packed in stout boxes with damp moss or leaves as packing material to ensure their reaching us in a fresh state. It is essential that flowers must accompany specimens of flowering plants, that fern fronds be fertile, and that the numbers be legible and firmly attached to the specimens. We cannot promise to name more than six specimens at one time from any one correspondent.

J. E. T.: 1, Viburnum plicatum; 2, Elæagnus longipes variegata; 3, Choisya ternata. No. 1 is readily propagated by layering; No. 2 by layering, by cuttings, or seeds; No. 3 by cuttings of ripened wood put in during spring or early summer under a bell glass.

A. T., Bournemouth: 1, Torenia Fournieri; 2, Lychnis diurna; 3, Aquilegia californica; 4, Catalpa bignonioides.

W. R. S., Derby: 1, Erythrina cristi-galli; 2, Iris florentina; 3, Sisymbrium alliaria, a weed; 4, Centaurea cyanea; 5, Clematis montana.

G. R., Kingston: 1, Cornus Späthi; 2, Euonymus radicans variegata; 3, Cænothus thyrsiflorus.

C. D. B., Halifax: 1, Streptocarpus Rexi; 2, Lathyrus splendens; 3, Veronica gentianoides.

H. C., Hants: 1, Retinospora pisifera; 2, a form of R. pisifera; 3, Cupressus Lawsoniana, a seedling form; 4, Taxus baccata aurea; 5, Calycanthus lævigatus; 6, Maxillaria marginata.

F. S., Beechwood: An exceedingly fine iris, and apparently an exceptionally fine form of the garden variety known as Walneri.

E. J. C., Croydon: A moderately good Cattleya Mossiæ, but by no means worthy of a special varietal name.

E. C., West Croydon: T. Trichopilia coccinea, a variable species; Cattleya labiata; Caliphruria subedentata.

S. G. R., Yalding: 1, Leycesteria formosa; 2, not a good specimen, probably Spiræa sorbifolia. Second set:—1, Pyrus Aria, a form very like P. A. scandica; 2, see next week. Please do not pack specimens in cotton wool, for, if unopened for a day or so, they can scarcely be identified.

P. S. T., Sutton-on-Hull: Can you send another specimen, with leaf, also indicate the form of inflorescence. See next week.

LAW.

LIABILITY OF SEEDSMEN.

THE case of HOWCROFT v. LAYCOCK, heard in the Court of Queen's Bench before Mr. Justice Day and Mr. Justice Lawrance, was an appeal from his Honour Mr. Lumley Smith, County Court Judge, raising a question as to the effect of a clause very commonly put at the head of seed merchants' bills. The clause was as follows: "Messrs. —— give no warranty, express or implied, as to description, quality, productiveness, or any other matter connected with the seeds they send out, and they will not be in any way responsible for the crop. If the purchaser does not accept the goods on these terms they are at once to be returned."

The plaintiffs had supplied some seeds to the defendant's order. The order was for a species of cabbage called Couve Tronchuda. The seed sent when it grew up turned out to be Jersey kale, a form of tree cabbage. The action was brought for the price of the seeds; the defendant counter-claimed for damages for breach of contract. The County Court Judge had an unreported case named "Reynolds v. Wrench," in the Court of Appeal, cited to him, and he referred to "Bowes v. Shand" (2 A.C.). He thought that the non-guarantee clause protected the plaintiffs. But for that he would have found for the defendant.

For the appellant, the defendant, Mr. A. T. Lawrence, Q.C., and Mr. G. B. Hamilton appeared, and cited the cases "Jocelyn v. Kingsford" (13 C.B., N.S., 447) and "Nicholl v. Godt" (10 Ex., 191).

Mr. Earle appeared for the plaintiffs, and cited "Allen v. Lake" (18 Q.B., 560) and "Randall v. Roper" (27 *L.J.*, Q.B., 266). He contended that when, in ordinary cases, goods had been accepted the purchaser could only recover for breach of warranty. Here, however, the purchaser had agreed not to raise any question of warranty, and therefore had no remedy. It was an important matter for seed sellers and seed growers all over the country. In this case the seed sellers had bought the seed from some one else, so there was no imputation on their *bonâ fides*. Seed would be very much dearer if the sellers had to guarantee it.

The Court allowed the appeal.

Mr. Justice Day was of opinion that the County Court Judge had been misled by a case which had no bearing on the question. The clause in question could not be construed to mean that no action should be brought. When Couve Tronchuda was ordered the seed sellers were not entitled to deliver something quite different. The custom of a trade might qualify a contract, but it could not destroy it. A rational construction must be put on the words relied upon. The construction desired by the respondents to be established was unreasonable.

Mr. Justice Lawrance concurred.

Leave to appeal was granted if an indemnity as to the costs were given to the plaintiff.

ENGAGEMENTS FOR THE ENSUING WEEK.

MEETINGS.

TUESDAY, JUNE 28.—Royal Horticultural Society Committees meet at Twelve o'clock; Demonstration on some Plants exhibited by the Rev. Prof. E. Henslow, M.A., V.M.H., at Three p.m. Southampton Horticultural Society; two days.

WEDNESDAY, JUNE 29.—Croydon Horticultural Society. Richmond Horticultural Society. Ancient Society of York Florists; Third Show. Canterbury Rose and Horticultural Society. Sutton Amateur Rose Society.

THURSDAY, JUNE 30.—Royal Horticultural Society of Ireland. Eltham Rose Show. Gloucester Rose Show. Norwich Horticultural Society.

SATURDAY, JULY 2.—National Rose Society's Provincial Exhibition at the Crystal Palace.

ROSE SHOW FIXTURES IN 1898.

June 25 (Saturday).—Windsor.
,, 28 (Tuesday).—*Leeds, †Southampton, and Sutton.

MARKETS.

Covent Garden.

THE market is well supplied with green vegetables, and the supply of peas is increasing day by day. Salading is moderately plentiful, and there are increasing supplies of fruits, especially cherries, strawberries, and apricots.

FRUIT.—Tasmanian apples, 8s. to 14s. per case; English grapes, 1s. 6d. to [illegible]; Jersey, 1s. to 1s. 6d. per lb.; pineapples, 2s. 6d. to 4s. 6d. each; bananas, 5s. to 9s. [illegible] bunch; cherries, 4s. to 6s. per half-sieve; strawberries, 1s. 6d. to 2s. 6d. per [illegible] basket; apricots, 6d. to 1s. per box; gooseberries, 3s. to 4s. per bushel; oranges, 16s. to 24s.; lemons, 8s. to 15s. per case; English tomatos, 5d. to 8d.; Jersey, 3d. to 5d. per lb.; Spanish, 1s. to 1s. 4d. per box; green figs, 2s. 6d. to 4s. 6d; peaches, 3s. to 12s. per dozen.

FLOWERS.—Arums, 3s. to 4s.; carnations, 1s. to 3s.; eucharis, 3s. to 4s.; gardenias, 1s. to 3s.; Lilium Harrisi, 3s. to 4s.; tea roses, 6d. to 1s.; pink roses, 3s. to 6s.; red roses, 2s. to 4s.; cattleyas, 6s. to 9s.; Odontoglossum crispum, 1s. 6d. to 4s.; and tuberoses, 1s. to 1s. 6d. per dozen blooms; Adiantum cuneatum, 4s. to 8s.; marguerites, 2s. to 4s.; mignonette, 2s. to 4s.; pelargoniums (scarlet), 4s. to 6s.; azaleas, 6d. to 9d.; stephanotis, 2s. to 3s.; lily of the valley, 6d. to 1s.; white gladiolus, 6d. to 9d; and pelargoniums, 4d. to 6d. per dozen sprays; bouvardias, 6d. to 8d.; white lilac, 3s. to 4s. per bunch.

VEGETABLES.—Egyptian onions, 5s. 6d. to 6s. 6d. per cwt.; English spring, 1s. 6d. to 2s. 6d. per dozen bunches; asparagus, 9d. to 4s. per bundle; rhubarb, 1s. 6d. to 2s. 6d. per dozen bundles; mushrooms, 6s. to 8s. per 12 lbs.; peas, 2s. to 4s. per bushel; French beans, 3d. per lb.; spinach, 1s. 6d. per bushel; new [illegible], 3s. 6d. to 4s.: turnips, 3s. 6d. to 4s. 6d.; parsley, 1s. to 1s. 6d.; mint, 2s. per dozen bunches; endive, 1s. to 1s. 3d.; cauliflowers, 1s. to 2s. per dozen; lettuce, 6d. to 9d. per score; Jersey potatos, 7s. to 8s.; Canary, 6s. 6d. to 7s. 6d.; St. Malo, 6s. to 7s. per cwt.; Lisbon, 3s. to 4s. per box.

Borough Potato Market.

The supply is larger than the demand, though the latter is good. Prices moderate. Belgians and Germans, 4s. 6d. to 5s. 3d. per bag. New—Teneriffe kidneys, 4s. to 4s. 6d.; St. Malo, 5s. 6d.; Jersey Flukes, 7s.; Kidneys, 6s. 6d.; Cherbourg Flukes, 5s. 6d.; kindneys, 5s.; English kidneys, 8s. to 8s. 6d. per cwt.; Lisbon rounds, 2s. 6d. to 3s, per box.

The mean reading of the Barometer during the week at Greenwich was 30·05 inches, and that of the Thermometer 55°·2, the latter being 3°·8 below the week's average in the 50 years 1841—90. The direction of the wind was variable, the horizontal movement of the air being 15 per cent. above the week's average in the 16 years 1860—75. The duration of registered bright sunshine in the week was 32·3 hours. The measured rainfall amounted to 0·01 of an inch.

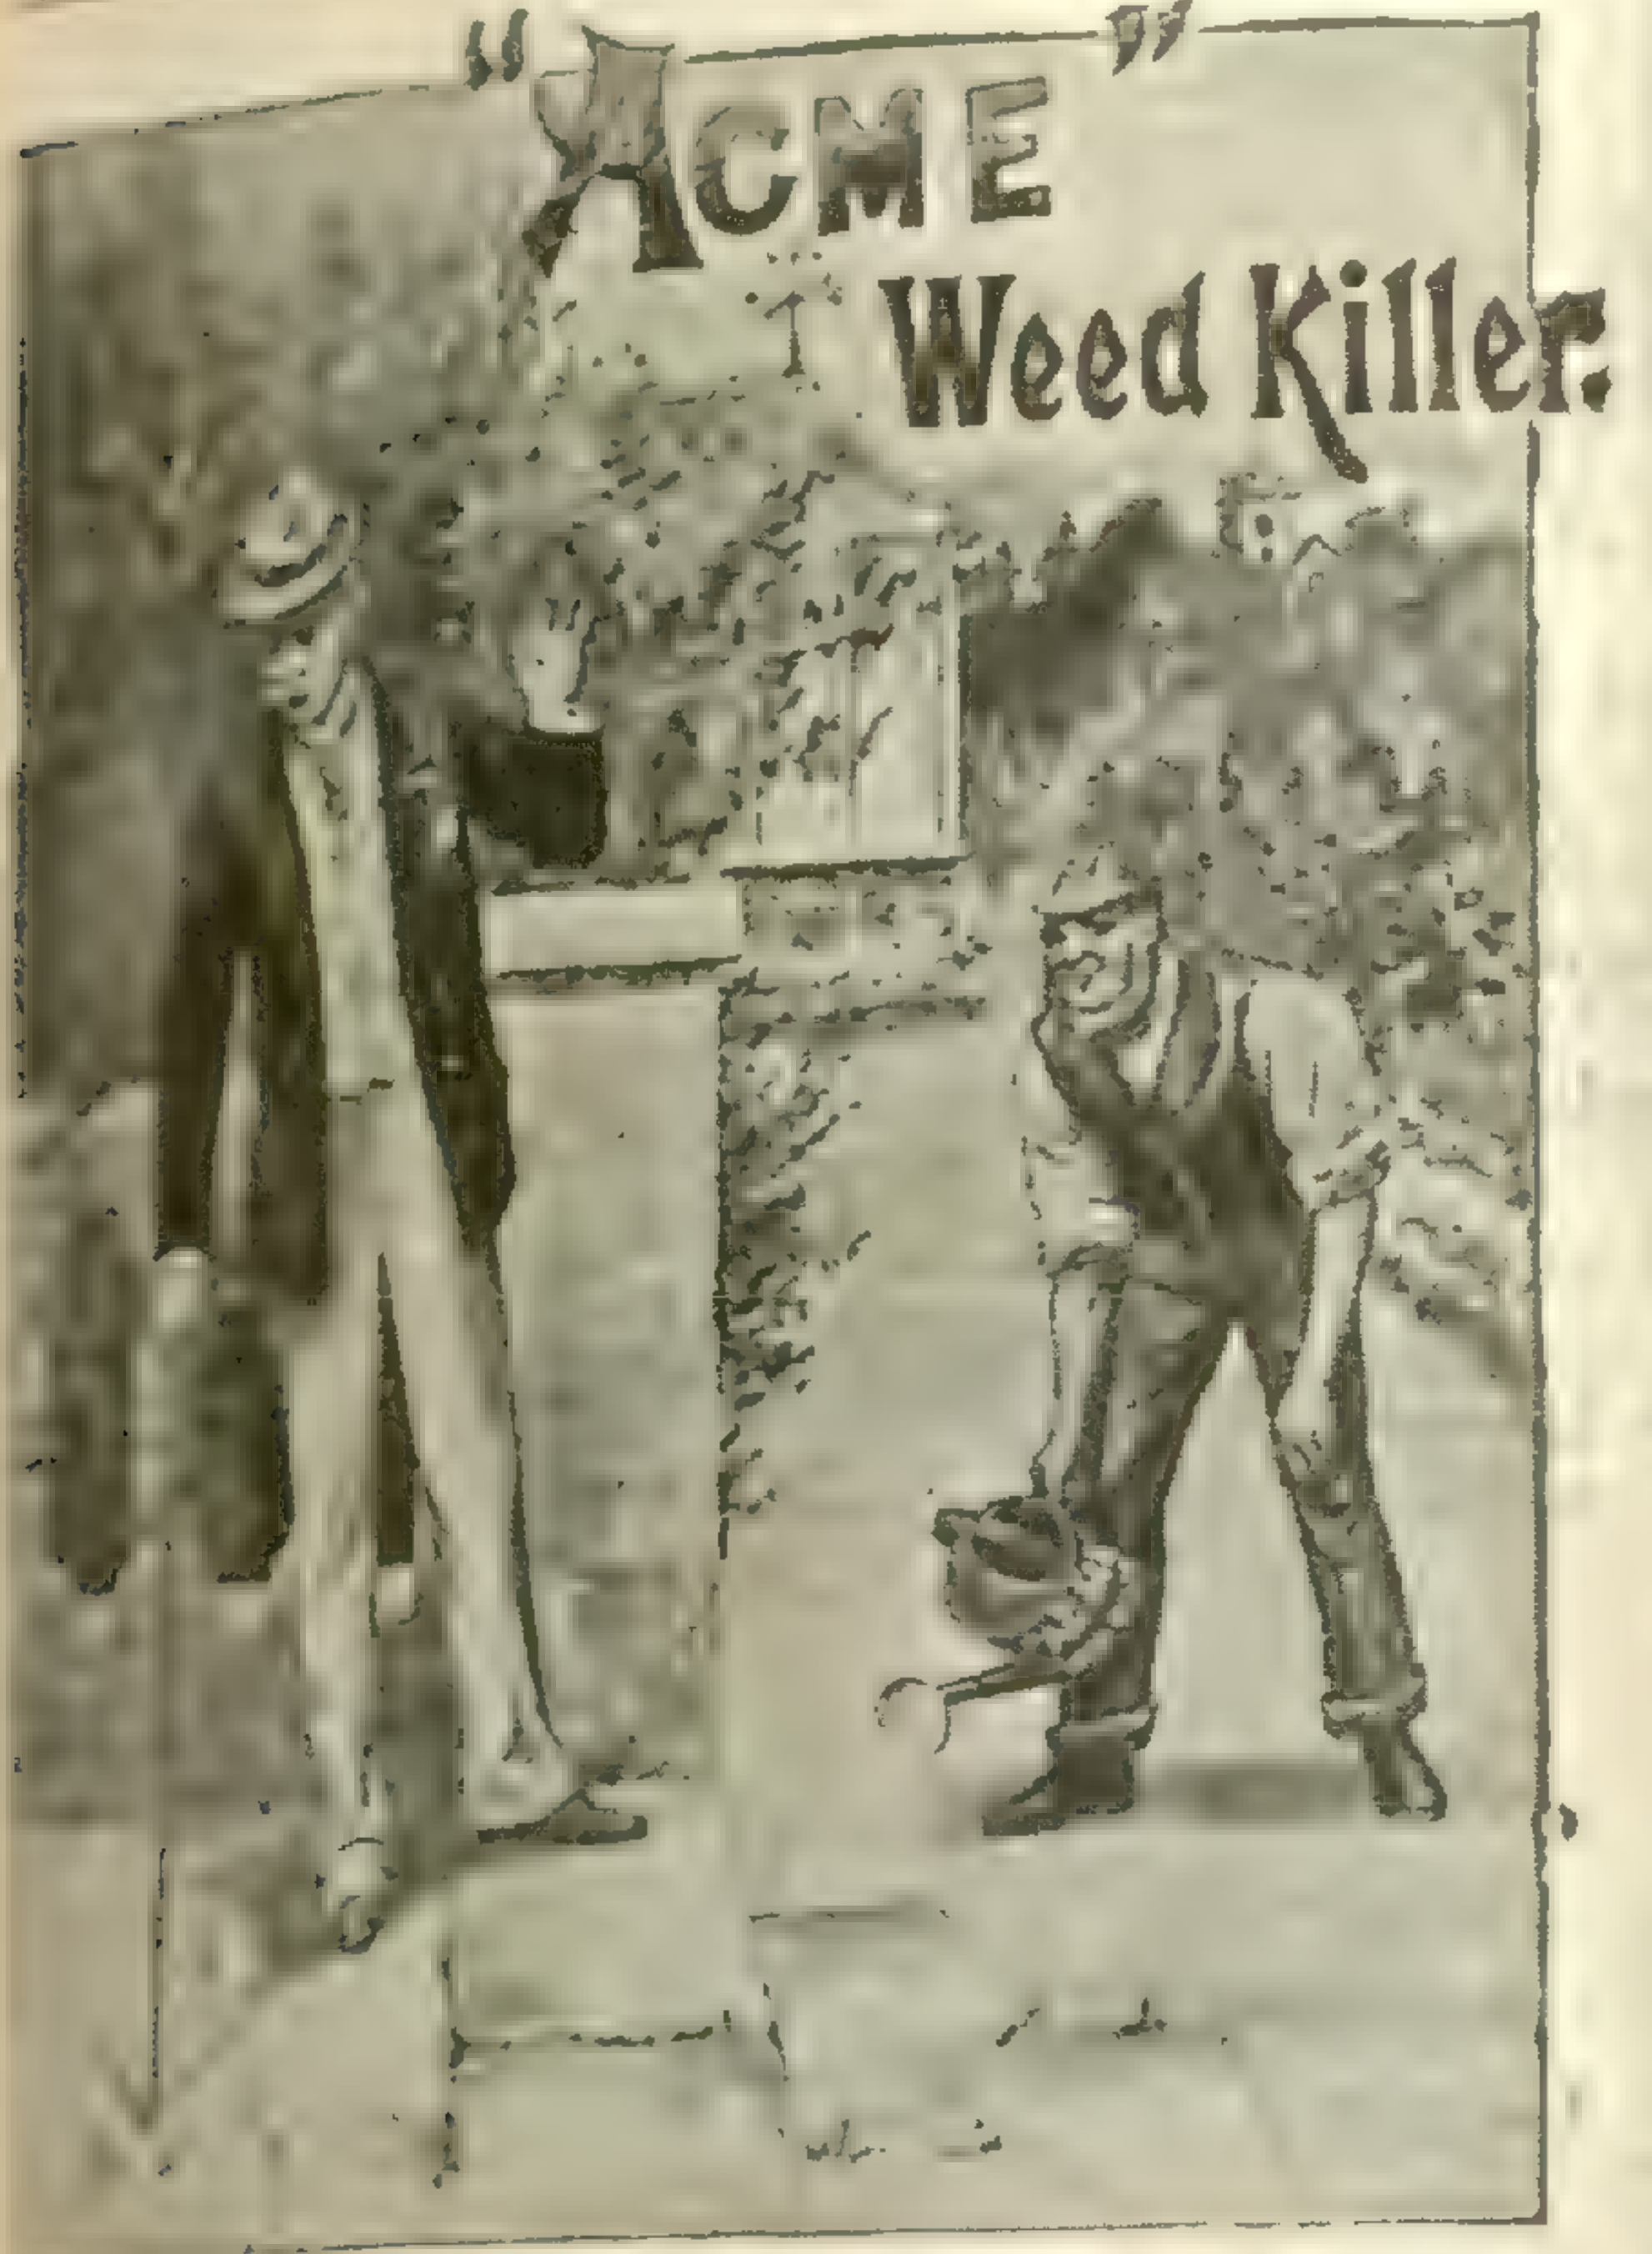
EVERY HOUSE may shortly be supplied with electric light by a simple piece of mechanism placed over the kitchen chimney, if a new plan of Edison's for generating electricity direct from heat is successful. Thus the poorest person could have the benefit of a useful invention which is now regarded as a luxury only for the comfort of the rich. Mr. Thomas Holloway, however, has given a greater blessing to humanity than has yet been afforded by the most wonderful discoveries of science. His Pills and Ointment have succeeded in cases where the greatest authorities on medical treatment have failed. Whatever the condition of a patient may be, these medicines will effect a cure if such a thing is humanly possible.—[ADVT.]



"Weeds, weeds, everywhere. I wonder if that new gardener [illegible] anything."

"Yes, Sir, I'm just using the 'Acme' Weed Killer. The best thing in the world for killing weeds."

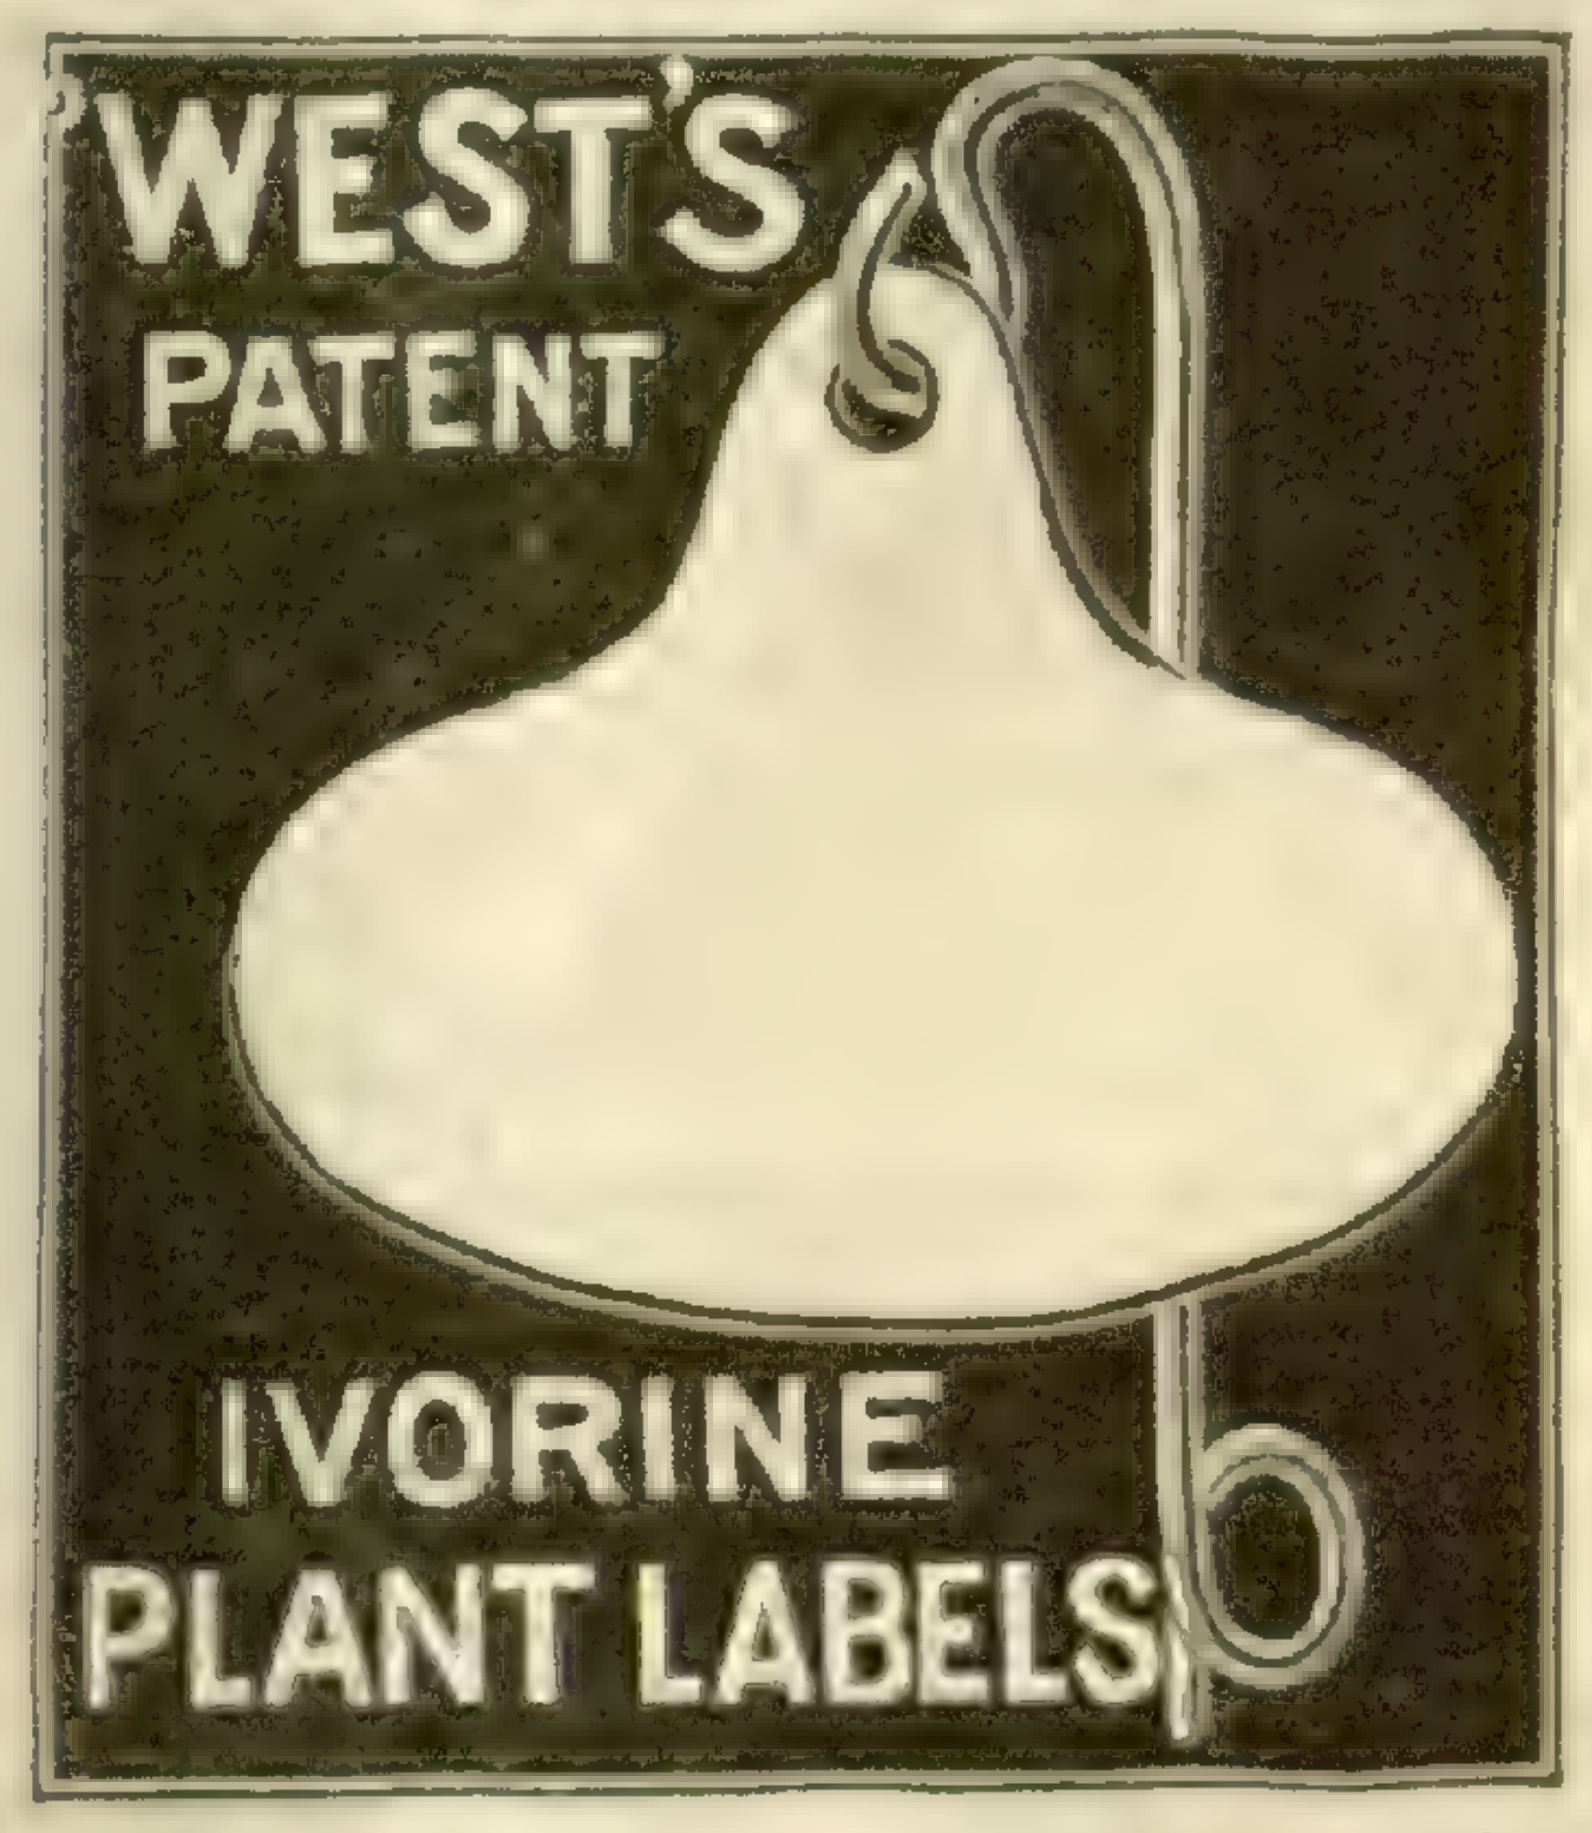
R. HALLIDAY and CO.,
ROYAL HORTICULTURAL WORKS,
MIDDLETON, MANCHESTER.



THE "IVORINE" WRITING DISC, being made of a Selluloid and Xylonite composition, is imperishable, and does not corrode or eat away, like wood and metal labels; and being ivory-white, when written upon it shows to perfection. And also, as the writing is on the Ivorine itself it is permanent, though washable, and does not become unreadable like all other labels, for hitherto all labels have been painted, as the paint gets old. It is for labelling every description of goods when used with or without the wires, and will last a century, either in a greenhouse, in a wine cellar, or out in a garden, and not only is it always ready for use, and may be written on both sides, but the name when written in pencil may be easily rubbed off, and so used as many times as desired.

Samples and Lists of the West's Patent Specialities post free. Price, **9d.** per dozen; **8s.** per gross, complete; **7s.** per gross without wires, Carriage Paid. Size a little larger than illustration, and wires 2 ins, longer from loop. (See List for other sizes). Special ink, if required, in **6d.** bottles, per post.

THE AMATEUR'S GREENHOUSE and CONSERVATORY.—*Illustrated with Engravings and Coloured Frontispiece.*—By Shirley Hibberd. A Complete Guide to the Construction, Heating, and Management of Greenhouses and Conservatories, and the Selection, Propagation, Cultivation, and Improvement of Ornamental Greenhouse and Conservatory Plants.

"This book is well adapted for amateurs. It points out, in its earlier chapters, the main considerations which affect the construction and heating of conservatories and greenhouses. In the fourth chapter the amateur is initiated in potting, composts, propagation, etc. Then follows a series of chapters in which the treatment of the different groups and families is explained, Greenhouse Herbaceous Plants leading the way, followed by the Chrysanthemum, to which a chapter is given; Soft-wooded Plants; Pelargoniums; Fuschias; Hard-wooded Plants; Ericas and Epacrises, Camellias, Azaleas, and Rhododendrons; Climbers; Oranges, etc. Hard-leaved Plants, as Agaves, Dracœnas, etc. Succulent-leaved Plants; Orchids and Pitcher Plants; Greenhouse Roses, etc. One chapter is devoted to a general selection of Greenhouse Plants; another to Summer Cucumbers and Seedling Pelargoniums; while others afford reminders of monthly work. The volume is nicely printed and elegantly bound; and, so far as we have had the opportunity of testing it, seems to be sound as to its practical recommendations."—*Gardeners' Chronicle.*

Fcap. 4to., cloth, bevelled boards, lettered in gold and colours. Price 5/-
By Shirley Hibberd.

THE IVY.—A Monograph.—*Illustrated with Coloured Plate and Wood Engravings. Small quarto, handsomely bound, cloth, gilt.* Comprising the History, Uses, Characteristics, and Affinities of the Plant, and a Descriptive List of all the Garden Ivies in Cultivation.

PRACTICAL LANDSCAPE GARDENING and ESTATE DEVELOPMENT CO

This Company undertakes to advise as to the laying out of gardens, the general improvement of landed property, and the development of building estates; to provide plans and estimates, and, for a fixed sum, to carry out all work incidental to the making of the smallest Villa garden as well as to the designing and execution of the most extended estate improvements.

It has a staff of experienced foremen, and all necessary plant.

No charge whatever is made for plans, which, however, remain the property of the Company unless the work is carried out by it.

All communications to be addressed to—

THREE INSERTIONS FOR THE PRICE OF TWO!

A MAN WANTS SITUATION in a suburban nursery; low wages would be accepted in return for extended experience in nursery.—E. ELSLEY, 10, Redman Place, High Street, Sevenoaks.

AS GARDENER (where help is given); well up in fruit trees, growing and forcing seakale, tomatoes, mushrooms, cucumbers, all kitchen garden work, pleasure ground, land stock, poultry if required; 15 years' excellent character from present place; middle age; married, one daughter.—J. SANSOM, Barcote Cottage, Faringdon, Berks.

BARR and SONS have on their Register several competent HEAD GARDENERS. They will be pleased to furnish full particulars on application.—12 and 13, King Street, Covent Garden, London.

COLONEL J. D. LEGARD will be pleased to RECOMMEND F. Horsnell as First Journeyman under a foreman; inside; eight years' experience inside and out; age 25; bothy preferred.—Apply F. HORSNELL, Welham Hall, Malton, Yorkshire.

FOREMAN (Inside, or good Second); age 25; good knowledge of forcing, early and late vines, peaches, melons, cucumbers, stove and greenhouse plants, &c. Can be highly recommended.—E. S., 18, Western Road, Kew Bridge, Brentford.

GARDENER (Head) where three or four are kept; life experience in all branches; age 40; married, two children; good references.—Address J. DENTON, Up Down Hill, Windlesham, Surrey.

GARDENER (Head, where another is kept), no objection to Good Second, where four or five are kept; 8 years in present situation as Second; 17 years' experience; single.—S. E., The Gardens, Highlands, Bolney, Sussex.

GARDENER (Head or Single-handed).—Gentleman can highly RECOMMEND his late gardener, left through breaking up establishment; life experience, inside and out; age 36; married.—W., 3, Spring Grove Gardens, East Molesey, Surrey.

GARDENER (Head Working or good Single-handed); Scotch; age 30; life experience in vines, peaches, tomatos, cucumbers, melons, stove and greenhouse plants, flower and kitchen garden; satisfactory reasons for leaving; first class references from present employer as to character and ability; total abstainer; married when suited.—C. W., 2,916, "Gardeners' Magazine" Offices, 148 and 149, Aldersgate Street, E.C.

GARDENER (Single Handed, or with help) REQUIRES SITUATION; experienced both inside and out; age 28.—B., 9, Keeley Road, Croydon.

GARDENER (good Single-handed, or with help); 7 years' experience in present situation; age 27. P. Barnett would be pleased to recommend his Under Gardener as above.—W. LUDGATE, care of J. LUDGATE, Farnham Common, near Slough.

GARDENER (good Single-handed, or with help); thoroughly experienced both Inside and Out; age 29; three years in last place.—"W. P," 48, Lewisham Road, S.E.

GARDENER (Single-handed, or otherwise); SITUATION REQUIRED by advertiser; eight years' experience in all the branches; age 24; abstainer.—Clawson Cottage, Rugby Road, Leamington Spa.

GARDENER.—Young Man, aged 26, SEEKS SITUATION; Single handed, or where help is given; well recommended by nursery manager; good references from private places previous.—Apply M. R., 23, Croft Terrace, Croft Road, North End, Portsmouth.

GARDENER (Second); age 26; 13 years' practical experience in all branches, inside and out; house and table decoration; former place as Second with the Earl Howe.—GEORGE, 3, Occupation Road, Wormley, Herts.

JOURNEYMAN or Improver in the houses; six years' experience in a large private garden, principally under glass; can be well recommended; bothy preferred; willing to pay good premium.—H. GRILLAGE, Plympton, Devon.

JOURNEYMAN (Second, in the House); age 26; good experience, inside and out; good character; abstainer.—J. COOK, 128, Archway Road, Highgate, N.

RICHARD SMITH and CO., beg to announce that they are constantly receiving application from Gardeners seeking Situations, and that they will be able to supply any Lady or Gentleman with particulars, &c.—St. John's Nurseries. Worcester.

SEED TRADE.—SITUATION WANTED in London, in September, or sooner, by an Englishman, aged 39, at present engaged as stock clerk in an American seed house; 11 years' experience in the United States; wages about 35s. per week.—Address SEEDS, 12, Eton Grove, Dacre Park, Lee, S.E.

UNDER GARDENER in pleasure ground and kitchen garden; six years with Sir Henry Bessemer; death cause of leaving.—Apply J. Y., 285, Camberwell New Road, S.E.

Situations Vacant.

Advertisements under this heading are charged 2s. 6d. for Four lines (32 words), and 6d. per line of eight words after.

WANTED, GARDENER (unmarried) to take charge of small kitchen garden, hothouses, &c.; must thoroughly understand all branches.—Address M. D., Chadstowe, Corbett Avenue, Droitwich, stating age and salary. Must have good references.

WANTED, a good GARDEN LABOURER; married preferred, no family or very small; wages 15s. per week, with cottage. Also YOUTH, about 20, to help the gardener inside and out.—Apply to HENRY BOWLES, Gardener, Southover Hall, Burwash, Sussex.

WANTED, LAD, about 18 or 19, as Assistant Gardener.—T. S., Waveney, Hainault Road, Leytonstone.

NOTICE TO ADVERTISERS.

Owing to continued increase in circulation, the "Gardeners' Magazine" now goes to press on Wednesday. No advertisement can be guaranteed insertion, or altered, unless received before Four p.m. on that day.

NOTES OF THE WEEK.

AN EXPERIMENTAL LAWN.

A WELL-KEPT lawn is one of the great charms of British gardens, and the verdant turf, soft and velvety to the tread, which results from high keeping, presents a striking contrast to that usually met with on the Continent, where the climatic conditions are not, speaking generally, favourable to the growth of the finer grasses. The chief points in the management of grass lawns have had full attention given to them in the pages of the GARDENERS' MAGAZINE, for we were the first to fully recognise the fact that the judicious application of fertilisers are not less necessary to the lawn than to the quarters of the kitchen garden. The success achieved in our endeavour to effect an improvement in the management of grass lawns has been sufficient to give us considerable satisfaction; but the thin and otherwise indifferent turf still met with is a proof admitting of no question that the influence of fertilisers upon grasses is not properly appreciated. Hitherto we have directed attention chiefly to the use of manurial agents as a means of maintaining the fertility of the soil; but our object in referring to the matter at the present time is to show the remarkable assistance fertilisers are able to give in the formation of the lawn. Five years ago a gentleman of our acquaintance became the tenant of a house that had been built upon land that had originally been used as a market garden, and had been allowed to lie idle for several years. Left to itself the land quickly had its surface covered with weeds, the grasses predominating. When the tenancy was entered upon the herbage consisted of the coarser grasses, thistles, docks, dandelions and daisies, and some weeds of minor importance. Rather more than a quarter of an acre was marked off for a lawn, and the question necessarily arose as to the best method of obtaining a good turf. We suggested, and properly so, the digging in of the weeds and laying down turf. This advice was not accepted on the ground of expense. As an alternative we recommeded deep digging and seeding with the finer grasses and trefoil; but this recommendation was not acted upon, and had we not been familiar with the immense influence exercised by phosphatic manures upon the growth of grasses we should have regarded the formation of a creditable lawn as hopeless. Happily our friend was amenable to the advice that he should spud out docks, thistles, and dandelions, and have the grass mown at intervals, first with a scythe and then with a machine; also that he should have the ground dressed with suitable artificials. He entered with considerable spirit into carrying out the experiment which we have watched with much interest, and when some mastery had been obtained over the deep rooting weeds, the spud was discarded and all the hollows were filled with fine soil to obtain a level surface. Subsequently the dandelions, the thistles, and the docks, were, in accordance with our advice, kept under by dropping a little petroleum into their centres, and this oil proved so destructive that these weeds disappeared as if by magic. Concurrently with the destruction of the tap rooted weeds the grasses spread over the surface, and with the assistance of liberal applications of bone meal and moderate dressings of sulphate of ammonia, the finer grasses, such as Cynosurus cristatus, Festuca ovina tenuifolia, F. duriuscula, F. rubra, and Poa pratensis, spread with great rapidity, and these and other grasses now form one of the most satisfactory lawns that has yet come under our notice. We do not suggest that the course here briefly described should be followed in making lawns, but we regard the experiment as of immense interest and of some importance, as a proof of the highly beneficial influence exercised by phosphatic manures upon the finer grasses and the indication it gives of their great value as aids in the maintenance of turf in the best possible condition.

HARD-WOODED PLANTS.

IT is not without a feeling of regret that we are compelled to acknowledge the fact that the hard-wooded plants, which include some of the most beautiful of the tender exotics with which our glass structures are embellished, are so little appreciated at the present time as to render it practically impossible to arouse some degree of enthusiasm in them, however successfully they may be cultivated. Within a comparatively short period, a finely flowered specimen of heath or pimelia created much interest at a public gathering, and the cultivator seldom failed to obtain a full measure of praise, but of late years the fashion has so changed that there is a difficulty in awakening an interest in them otherwise than of a very languid character. We had a conclusive proof of the indifference to hard-wooded plants grown for their flowers at the meeting of the Royal Horticultural Society on Tuesday, when plants that were quite unique as examples of high-class cultural skill, failed to obtain recognition from those responsible for making the awards to miscellaneous contributions. Messrs. Balchin and Sons, who have achieved so much success in the cultivation of these plants for decorative purposes, sent from their nurseries at Hassocks ten plants of the surprisingly beautiful Phænocoma prolifera Barnesi, which at one time was seldom absent from collections of stove and greenhouse plants exhibited during the summer months. From it having been so frequently shown in specimen form, it came to be regarded as suitable only for large specimens, but by means of the plants shown on Tuesday, Messrs. Balchin proved to demonstration that when properly grown it possesses much value for decorative purposes. The plants exhibited were grown in six-inch pots with single stems, which were clothed with healthy growths from the base, and surmounted by large heads of flowers, remarkable alike for their size and high colouring. Having regard to their vigour and profusion of flowers, the plants have had no equals. We have not seen any that could approach them, nor can we find any record in the GARDENERS' MAGAZINE of similar examples having been presented to public notice during the sixty-five years that have elapsed since it was founded. Considering these facts, it is unfortunate the group should not have received some award, when other subjects, certainly not more beautiful, but representing far less cultural skill, should have obtained distinction. We would fain hope that they were overlooked, owing to the crowded state of the Drill, and we shall be pleased to hear that this was the case, for under no other circumstances, except the unpopularity of hard-wooded plants, can we understand their failing to obtain recognition.

SHEAVES OF ROSES.

ALTHOUGH but few rose shows have as yet been held, we have received several letters referring to the methods of staging garden roses, and complaining of the excessive number of trusses used in the formation of the bunches. One of our correspondents speaks of these as "huge sheaves of roses," and proceeds to point out the disadvantages under which exhibitors with limited resources are placed under existing conditions. We are not able to agree with our correspondent in his estimate of the size of the bunches in collections of garden roses; but we are in full sympathy with his views with regard to the necessity of imposing some limit to the number of trusses staged of each variety. A reduction is necessary in the interest of good taste, as well as that of the growers of a limited number of plants, for the large crowded bunches produce anything but a pleasing and tasteful display. The varieties belonging to the category of garden roses differ so materially in the size of the individual blooms, and the number of flowers in the spray or truss that it does not appear desirable to compel the exhibitor to stage the same number of trusses of each variety. At the present time the National Rose Society stipulates, in its classes for garden roses, that not less than three trusses of each variety shall be shown; as the necessity of a minimum has been acknowledged, it may be hoped that a maximum number will be fixed at no distant date. Possibly seven would be a suitable number, but there is room for some difference upon this point, and our present object is simply to give expression to the views held by a considerable number as to the desirability of taking such steps as will prevent the staging of the large bunches which some exhibitors consider essential to success at competitive gatherings.

Gardeners' Magazine Rose Number, as we announced in our last issue, will be published on the 9th inst., and the list of contributors given in our advertisement pages is a sufficient proof that the contents will be of exceptional interest to rosarians, and, indeed, to the general body of horticulturists. In addition to the black and white illustrations, we shall present with the issue a coloured plate of the beautiful new rose Queen Mab.

The Rose Season.—The abnormally low temperature that was experienced in May and during the greater part of June has made its mark upon the roses as well as upon the stone fruits, but in a different manner. In the case of the latter the crop has been materially reduced, but with the roses the effect of the unfavourable climatic conditions has been to greatly retard the expansion of the flowers. The development of the buds has, indeed, been so slow that in gardens where roses are largely grown the blooms can only be numbered by dozens, instead of hundreds; and in the case of the commercial establishments, the lateness of the season can hardly fail to make a material difference in the returns, as the demand for cut roses for decoration is necessarily more brisk during the London season than after its close. The early exhibitions, as shown by our reports, have suffered from the comparative scarcity of blooms, and the prospects of the mid-season and late shows are giving rise to considerable speculation on the part of those who take a keen interest in the competitive aspects of rose culture. Especially is much interest evinced at the time of writing in the National Rose Society's metropolitan exhibition at the Crystal Palace on Saturday, the 22nd inst., and its prospects depend wholly upon the climatic conditions that obtain during the two or three days immediately preceding the date. It is extremely difficult to forecast them with any considerable degree of accuracy. Should the weather be sunny and warm, the exhibition has the promise of being of large extent and high quality, for the slowly-swelling buds are remarkable for their size and solidity. On the other hand, should the temperature continue low, some exhibitors from the midland and northern counties may not be able to put in an appearance, while others will be unable to enter in so many classes as they have done in previous years. While there is room for some doubt as to the extent of the Crystal Palace, there is none as to the quality of the blooms that will be staged, for both dark and light varieties have the promise of attaining a high degree of development. Roses should be exceptionally well shown during the following week, and the National Rose Society's northern exhibition on the 13th inst. should be the finest of the northern gatherings of late years.

Cultural Developments in Vegetables.—The conversion of various popular roots of to-day from an utterly useless and annual form into very valuable food roots and biennials by the simple process of selection and cultivation, which were so interestingly pointed out by the Rev. G. Henslow in his recent lecture at Chiswick, is entitled to rank amongst the most remarkable things that have occurred in connection with gardening. No one wishes to depreciate the labours of the florists of the past or present day, but hardly too much praise can be given to those patient cultivators of a past age who eventually evolved for their own and future generations of consumers such splendid roots as carrots, parsnips, beets, turnips, radishes, and others from wild plants that previously had no food value whatever. The carrot, said Mr. Henslow, was originally a mere woody-stemmed annual, now it is a world-wide grown succulent root, and of a biennial nature. Sometimes seedling plants exhibit the original by bolting off to flower the same season, but these are exceptions that prove the rule of conduct. As a biennial, the beet, which was a perennial with a hard woody stem also, now employs all its energies in the production of a massive fleshy root, and cannot produce seed the same season. But with this, as with all other similar roots, this fleshy matter is a store of food for the flower and seed producing stem, and the seed product of the biennial plant far exceeds what it could have produced as an annual. The potato was formerly a free seed-producing plant. Now its energies are devoted to the production of tubers, latent stores of buds of a starchy nature; hence we have to largely depend on these root buds for propagation and perpetuation of this important root. How full of interest is information concerning plants we always grow and yet know so little about.

American Fruit Crops.—At this season of the year there are always demands for authentic information regarding fruit prospects, in America as well as in this country. Western New York is a vast fruit garden, and the crop it produces has much to do with the market supplies. Mr. S. D. Willard, of Ontario County, N.Y., writing to an American contemporary on fruit prospects, says that the outlook for the fruit growers is not satisfactory. Currants promise a light crop except Pres. Wilder. Gooseberries are good, with a tendency to mildew. Lombard, Bradshaw, and some other plums are a failure; Reine Claude and a few other sorts promise a partial crop. As a whole, plums in that region are about one-third last season's product. Bartlett pears are scarcely more than one-third of a setting. Kieffer shows up best of any variety. Cherries are not equal to the crop of 1897, but afford a fair showing. Apples promise well, but it is yet too early to venture an opinion as to the result. The Tent caterpillar, in its ravages, exceeds anything he has ever known. They have for several weeks been engaged in destroying its nests by a systematic weekly effort, and have handled nearly 2,000 of them, while with the masses neglect has been the order of the day, and the result remains to be seen. The curl leaf has worked injury to the peach orchards beyond description, in many instances entirely defoliating the trees, with a probability of greatly reducing the crop.

New Late Peach.—The introduction of a new peach of the highest quality and ripening late in the season is an event of sufficient importance to fully justify the interest created by the remarkably fine variety submitted to the R.H.S. Fruit Committee by Messrs. T. Rivers and Son on Tuesday last. The fruits are of the largest size, pleasing in colour, and richly flavoured. The lateness of the variety is indicated by the fact that pot trees, started in the forcing house in December with Cardinal and Early Rivers nectarines, are now ripening their crop, while the fruit of the two nectarines was gathered in April and May. This handsome peach has been named Thomas Rivers, and has the promise of proving in every way worthy of the distinguished name it bears. It is described as producing good crops, and ripening perfectly in an unheated structure.

A New Hybrid Tea Rose.—The new hybrid tea rose exhibited by Messrs. Paul and Son at Westminster on Tuesday, under the name of Una, is one of the most interesting additions that has yet been made to the group. Mr. George Paul informs us that it was raised from a cross effected between one of the tea roses and the Dog Rose (Rosa canina), the latter being the seed-bearing parent; we did not learn the name of the variety used as the pollen-bearing parent, but from a careful examination of the specimens exhibited we are inclined to the opinion that it was Gloire de Dijon. The variety is of vigorous habit, some of the growths having obtained a length of twenty-five feet, and the flowers are semi-double, about four inches in diameter, and of a rich cream colour with delicate buff tint. Una is deserving of attention for its beauty, and is of much interest in indicating the possibilities of rose hybridisation.

Sicily Fruit Trade.—Fruits form the most important of the foreign export trade in Sicily, which is now in a very depressed condition. The unsatisfactory state of the fruit trade may, in the opinion of the British Vice-Consul at Messina, be attributed principally to three causes, which are likely from their very nature to continue to operate unfavourably in checking the fruit exportation of Sicily unless removed or neutralised by more liberal regulations, new outlets, and sounder principles of trade. They are, first, the recent excessive protective duties decreed by the Government of the United States, against the importation of lemons and oranges from abroad. Secondly, the somewhat sudden stoppage of advances on the price of the fruit on the part of foreign purchasers to Sicilian vendors, a system which, however plausible, became in practice such a fruitful source of dishonest dealing, that, taught by dearly bought experience, the repeatedly victimised British and American firms have at last resolutely declined to deal with other than well-known houses, who neither require nor expect advances. Thirdly, the extension of the orange and lemon plantations of California, Florida, Mexico, and Jamaica, not to mention those of the British colonies of Queensland and Victoria. These facts are more than sufficient to account for the decline of the Sicilian fruit market, and hence the consequent falling-off in the number and cargoes of British shipping at this port during the year 1897.

Culture of the Globe Artichoke is an important and ever-increasing industry in Catania, as farmers find that certain lands in the plain, which are well irrigated by the Limeto Canal, give better returns than if sown with wheat. Some 1,600 acres are put under such cultivation, and produce from 12,000 to to 13,000 artichokes per acre, which fetch from 25s. to 30s. per 1,000, on the spot, December 1 to the end of January. During this period the plants produce about one-fifth of their total production, and these early artichokes are shipped off to the continent of Italy and Austria, whilst the later artichokes are consumed in the island, and naturally fetch lower prices.

Rose Conference at Bath.—The conference held by the National Rose Society in conjunction with its southern exhibition at Bath, of which we gave a full report in our issue of the 25th ult., proved a decided success, and fully justified the new departure by the society. There was a good mixture of rosarians, and the admirable paper by Mr. W. F. Cooling on "Rose Pruning" created much interest. Mr. Cooling suggested that hybrid perpetuals should be pruned according to the vigour of the varieties, the strong growers to be cut back to five or six buds, and the others to the second or third bud. Garden roses, on the other hand, should have but little pruning, and, in Mr. Cooling's opinion, they were at present pruned much too severely. He suggested that, instead of their being pruned in accordance with orthodox methods, the growths should be thinned out at the close of the flowering season to allow room for the young growths to attain their full development and become well ripened. In the autumn or spring the flowering shoots should be bent or pegged down without being shortened or having more than the tops taken off, as when this was done they became wreaths of roses during the season of flowering. Mr. Pemberton expressed an opinion that the pruning of roses was imperfectly understood, and said the knife was used much too freely, more especially in the case of the hybrid teas. Mr. E. Mawley, Mr. W. J. Grant, Mr. A. H. Gray, and Mr. Landon also took part in the discussion, which proceeded briskly and was of exceptional interest.

Potatos in Scotland have been greatly benefited by the recent genial weather. The sales of early potatos in the Ayrshire district have been satisfactory for the growers, and for the most part show an advance on the prices current at the same period last year. A beginning was made about a fortnight ago in the lifting of the early crop, and last week potato digging became general in Ayrshire. The later fields give promise of a good crop, and the stem of the potato is very much stronger than last season. The tonnage of the later crops will, of course, depend on the weather of the next two months. Any growers who had the courage to keep potatos of last year's growth till this time are reaping their reward in higher prices than have been current during the season. The early potato sales were not affected by the potato "boycott," as co-operative bids were not refused. In fact, the potato "boycott" has turned out a miserable fiasco, and even the merchants in favour of the movement at first are now deserting its ranks on seeing where the principles of a "boycott" are likely to lead them.

The Value of Lime in the garden has been frequently referred to in these pages, more particularly for the purpose of sweetening soils that in consequence of the liberal application of stable and farmyard manures have become more or less sour, and for checking the development of fungi injurious to vegetation. In America liberal applications of lime to the soil have been found useful in checking the bacterial disease of the tomato, which annually inflicts heavy losses in the United States, and occasionally does considerable damage to crops grown under glass in this country. The investigations that have been made fully justify the views of those who regard calcareous matter as an essential part of the compost for indoor crops of tomatos.

English-grown Pineapples are now so sparingly represented at public exhibitions that the splendid fruits of The Queen exhibited by Mr. M. Gleeson, of the Warren House gardens, Stanmore, at the Royal Horticultural Society's meeting on Tuesday came as a pleasant surprise. Nine fruits of an average weight of five and a-half pounds were staged, and they were distinguished by their finish and perfect maturation as well as for their weight. In admiring these excellent examples it was impossible to restrain a feeling of regret that public taste had so far become perverted as to prefer Smooth Cayenne of foreign production to the richly-flavoured Queen of home growth. It is no unusual occurrence to be told that the St. Michael's pines are equal to the best grown in England; but almost invariably those who make these assertions have not tasted a home-grown Smooth Cayenne, which, by the way, is decidedly inferior to fruit of The Queen when ripened during the summer season.

Potato Sets.—A recent bulletine of the Louisiana Station gives some interesting reports from the horticultural department, regarding the growth and culture of various vegetables and fruits. With regard to potatos, it is stated that formerly only Eastern potatos were used for seed in the South, but now it is found that the southern second-crop potato is really superior as seed. One trouble in the past has been the difficulty of securing a stand with the second crop, as the dry weather in August prevented an early growth. The following plan has been found to obviate this difficulty: After the first crop of potatos has been thoroughly dried in the shade, they are taken the day before planting and placed in a tub of water, where they remain over night. Then they are cut into pieces and permitted to fall back into the water; removed directly out of this water and planted in a deep furrow, covered heavily with well pulverised earth. After planting they are carefully watched; as soon as they sprout the excess of earth is removed, either with a board or with a hoe. Handled in this way it is said that many farmers are making a great success with second-growth potatos, and not only growing their own seed for the following spring, but supplying a profitable local demand.

Messrs. Lindens' Establishment at Moortebecke was visited by His Majesty, the King of the Belgians, on Thursday, June 23, and under the guidance of Mr. Lucien Linden, he devoted nearly five hours to the inspection of the many objects of interest. His Majesty was especially interested in the large collections of cattleyas and odontoglossums, and more especially in the many fine forms that were then in bloom. In walking through the several houses, the King evinced the warm interest he takes in matters of horticulture, which forms such an important industry in Belgium, and expressed his appreciation of the admirable arrangement and perfect condition of the several departments. On leaving, his Majesty heartily congratulated M. Lucien Linden on the establishment he has created, and maintains in so efficient a manner, observing "C'est un establissement et des cultures modèles."

Application of Insecticides.—In the course of an exhaustive paper on insects injurious to plant life, Professor J. B. Smith gives much useful advice on the methods of applying the various insecticides, and directs special attention to the greater effectiveness of the latter when applied in the form of an invisible spray. With reference to this matter the author says that to understand just how contact poisons work on insects we must consider for an instant their general anatomy, and particularly their mode of breathing. Insects have no closed system of blood circulation such as we find in higher animals. There is only one long tube more or less divided into chambers and this acts as a pump, forcing the blood into the head cavity, and from there it makes its way through the body among the muscles and viscera until it finds its way back into the pump. Neither do insects have lungs, and yet they require air to purify the blood, for life is essentially the same in them as in man. Therefore a modification in structure has occured, and the air is carried in flexible tubes to all parts of the body. These tubes go everywhere where the blood goes, and they open along the sides of the body—never on the head. An insect breathes, then, along the entire length of each side, and there may be as many as twenty openings, although there are usually less. Ordinarily contact poisons act through these spiracles or breathing pores, though sometimes, on soft-bodied slugs we can use caustics. In the greenhouse, however, these caustics would be almost as dangerous to the plants as to the insects, hence the other materials which act through the spiracles must be employed. This leads naturally to another very important point that must be considered, and whose neglect accounts for many failures. Most insects have the bodies either pubescent, very polished, or powdery, or somewhat waxy on the surface, so that they shed water quite readily, and any application of a coarse spray simply rolls off without effect. So also the spiracles or breathing pores are furnished with protecting screens of hair or bristles which serve to keep out foreign material. A large drop of water or watery decoction has not the least chance of penetrating through this protection, and the application is useless as an insecticide. Use the same mixture with an atomizer, and the result will be quite different. The minute globules adhere readily to the insect, because they are not heavy enough to roll off; they penetrate between the protecting screen or under it, and enter the body with the in-breathing. Therefore, when the tobacco or any other watery mixture is to be applied, it should be put on in as fine a spray as can be secured. For cleaning indoor plants of all save scale insects, a tobacco soap-suds when applied with an atomizer is, in the opinion of Professor Smith, almost perfect. Soap-suds have an advantage over more watery mixtures, because they adhere better. The insect surface that will shed a droplet of water will retain and become covered by one of soap-suds—hence a tobacco soap is better than a tobacco tea, though neither is equal to a tobacco smoke or tobacco vapour.

The Queen's Diamond Jubilee Cup for Roses.—Last year Her Majesty the Queen presented a handsome challenge cup to the Windsor Rose Society, in whose affairs she takes much personal interest, to be offered for competition in the class considered most suitable by the executive. In view of its intrinsic value, and the exalted position of the donor, the committee offered the cup as the premier award in the class for forty-eight blooms, and imposed the condition that it should be won twice before becoming the property of the exhibitor. At the society's exhibition in 1897, the competition for the challenge cup was very severe, as becomes its importance, and in the result, Mr. B. R. Cant, of Colchester, was the winner, staging a magnificent collection. At the exhibition for the current year, held on June 25, there was again a brisk contest, and Mr. B. R. Cant was again the winner, and is therefore now able to assign the cup a permanent position amongst his many other rose trophies. The blooms staged were distinguished by their large size, extreme freshness, and high finish, and the varieties of which the collection consisted were A. K. Williams, Susanna M. Rodocanachi, Medea, Annie Laxton, Ulrich Brunner, Madame Cusin, Duchesse de Vallombrosa, Violette Bauyer, Madame Hoste, Duke of Edinburgh, Anna Olivier, Jean Ducher, General Jacqueminot, Catherine Mermet, Cleopatra, Gustave Piganeau, Ethel Brownlow, Golden Gate, Helen Keller, Maréchal Niel, Marie van Houtte, Jean Soupert, Princess of Wales, The Bride, La France, Souvenir d'Elise Vardon, Niphetos, Le Havre, Souvenir de S. A. Prince, White Lady, Madame Delville, Souvenir d'un Ami, Caroline Testout, Madame Gabriel Luizet, Duchess of Albany, Magna Charta, Kaiserin Augusta Victoria, Marguerite Boudet, Lady Mary Fitzwilliam, Marie Baumann, Mrs. W. J. Grant, Marquise de Castellane, Viscountess Folkestone, Mrs. John Laing, Dupuy Jamain, Mrs. Sharman Crawford, Marquise Litta, and Prince Arthur. We give herewith an illustration of the handsome cup, and congratulate Mr. Cant on his success in winning it.

Vanilla Culture in Seychelles has undergone considerable extension of late years, and the growers are obtaining good prices for the pods. Mr. H Cockham Stewart, the Administrator, states in his annual report that the vanilla crop of last year was the largest that has ever been grown in Seychelles—63,000 lb. This large output of vanilla has given a fresh impetus to its cultivation and a very large quantity has been planted during the past year. When the country is opened up by means of roads, as will shortly be the case, many acres of vanilla land will no doubt be taken up which at present are uncultivated, owing to the difficulty of transport. In one district alone, the Mare aux Cochons, there are about five thousand acres of virgin soil well suited to vanilla. The cultivation of vanilla only dates back to about twenty years ago, and is only now beginning to be thoroughly understood. The Mexican system of allowing the vines to grow under trees nearly wild is almost universally adopted at present, and is described as a decided improvement on the old system of training the vine on artificial supports. Most of the land in Seychelles is in the hands of private owners, and it is difficult to estimate its cost. It has been stated that landowners are reluctant to part with their land, but Mr. Stewart does not apprehend much difficulty on this score provided that purchasers are prepared to pay ready money. There is some land belonging to the Government well adapted for vanilla cultivation which can be leased for periods varying from nine to twenty-one years. Seychelles is unfortunately almost a *terra incognita*, and the Administrator is of the opinion that if the scores of young Englishmen who leave the mother country year after year for other lands knew of it, they would give the preference to an English colony which offers advantages not to be met with elsewhere for the investment of small capital, say £1,000.

Florida Pineapples.—The crop of pineapples in Florida, although below the average, is better than was at one time expected, and is estimated at between 150,000 and 160,000 crates. The fruits are of good quality, and the prices have increased sufficiently to compensate for the deficiency in numbers. The fruits are smaller from the Florida Keys, is smaller and not so richly flavoured as that from the Indian River districts, and the market for the latter is being materially inspired by the shippers marking their Keys fruit Indian River.

Flora of Simla.—Since his retirement from active service, Colonel Sir Henry Collett has devoted much of his time to preparing at Kew a Flora of Simla and the adjacent district. Simla itself is situated at an elevation of about 7,000 feet, and the area included gives a range of altitudes from 3,000 feet in the valleys to 10,000 feet, the summit of Huttoo, hence the vegetation is highly diversified. Including ferns and a few other vascular cryptogams, the total number of species is estimated at about 1,500. The work, which is well advanced, is to be illustrated by 200 figures in the text, all uniformly half natural size, reduced from drawings, by Miss M. Smith, of natural size. Sir Henry has, we learn from the *Kew Bulletin*, presented the first portion of the original drawings to Kew.

Esparto Grass to the extent of 8,416 tons was exported from Carthagena in 1897. This is the grass so largely used for making high-class paper, and it is pleasing to note that the whole export came to Great Britain. The 1897 shipments were 1,245 tons in excess of those of 1896. Aguilas exported 21,950 tons of esparto to Great Britain, but the 1897 crop was 10,000 tons below that of 1896, owing to the lack of rain throughout the growing season.

ROYAL HORTICULTURAL SOCIETY.

THERE was a splendid show at the Drill Hall on Tuesday and if one has any regret with regard to it it is that amateur exhibitors were so few. Nearly the whole of the exhibits were from nurserymen, and some were very large. Carnations, pæonies, hardy flowers generally, ferns, roses, and orchids were the chief subjects. Fruit was well shown though not extensively, and the pineapples were exceptionally good.

ORCHID COMMITTEE.

There was a goodly display of orchids, but novelties were not so numerous as usual. Messrs. Hugh Low and Co., Bush Hill Park, Enfield, had a lovely display of cattleyas, mostly beautiful forms of C. Mossiæ and including several exquisite white segmented varieties. Among these were staged good plants of Cypripedium Curtisi, Epidendrum prismatocarpum, Oncidium crispum, O. macranthum, and Lælia grandis tenebrosa. This firm also showed two fine new cypripediums, C. I'Ansoni and C. Mrs. Reginald Young, described elsewhere.

Messrs. B. S. Williams and Son, Holloway, staged a fine lot of orchids, showing excellent forms of Cattleya Mossiæ, and numerous Lælio-cattleyas, including L.-c. Canhamiana, L.-c. Edouard Andre, the latter a hybrid between L. purpurata and C. Mossiæ, a bold purple-lipped orchid of great beauty, Cochlicda Noetzliana, Thunia Marshalliana triloba, Aerides expansum, and odontoglossums were all good: Cattleya Breanteana, rich purple, was an attraction. A small group from Messrs. Stanley-Mobbs, and Ashton, Southgate, contained many interesting orchids, such as Mormodes unicolour, Oncidium Lanceanum, Odontoglossum crispum, Dendrobium Bensoniæ, Lælia tenebrosa, and a good form of Cattleya Mendeli.

The contribution of Messrs. J. Veitch and Sons, Chelsea, was extensive, well-arranged, and contained many beautiful orchids. Especially fine were Lælio-cattleya eximia, L.-c. endora alba, L.-c. Hippolyta, L.-c. Canhamiana alba, Disa Kewensis, the brilliant Epiphronitis Veitchi, a beautiful dark-lipped Lælia purpurata, forms of Cattleya Mossiæ, Dendrobium Dalhouseanum, D. Dearei, and Vanda cristata superba, with many others of note, not forgetting the hybrid Odontoglossum excellens, and Phalænopsis Ludde-violacea.

Mr. W. H. White, grower to Sir Trevor Lawrence, Bart., brought the wonderful creamy and crimson Stanhopea Rodigasiana, a remarkable species; Odontoglossum excellens Sanderæ, a beautiful orchid; Cattleya gigas and Habenaria rhodocheila. Mr. W. H. Young, grower to Sir F. Wigan, East Sheen, sent an exceptionally handsome form of Lælio-cattleya Canhamiana, named Joyce Wigan. Mr. A. Wright, gardener to T. McMeekin, Esq., Falkland Park, Norwood, sent a fine flowering plant of the Falkland Park var of Cypripedium Rothschildeanum. Mr. W. Pope, gardener to J. P. White, Esq., The Willows, Twyford, sent a specimen of Cattleya guttata Leopoldi, a splendid full spike of purple and red-green flowers. Mr. J. Hudson, gardener to L. de Rothschild, Esq., Gunnersbury House, Acton, sent Mormodes unicolor.

FLORAL COMMITTEE.

Liliums in considerable variety were shown by Messrs. R. Wallace and Co., Colchester; the firm staging L. bellruum in quantity, L. auratum L. umbellatum, L. Henryi, L, Dalhansoni, L. Hansoni, L zovitzianum, etc. There were shown quite naturally in baskets and pans, Calochorti, brodiæas, iris of sorts including I. Monieri, one of the pesudo-ocorus group, a fine yellow and a new Japanese pæony, a single form named P. albiflora streala, and apparently of little worth in its present condition. A charming new gladiolus of the Colvillei type was shown by Messrs. Sutton and Sons, Reading. It is named Queen of the Roses, and is of a pleasing and lovely shade of pinkish-rose; the flowers are large and the spikes robust and branched; the strongest grower of its group. The Reading firm also showed a collection of well grown petunias, all exquisitely frilled and fringed double varieties, representing a wide range of colour; many of the freely flowered specimens were but five months old from seed sowing.

Messrs. Kelway and Sons, Langport, Somerset, contributed a magnificent group of their specialities—pæonies, delphiniums, and gaillardias; the creamy-white delphinium, Beauty of Langport, was an attraction, but not nearly so effective as the rich violet Imperial Majesty, and the lighter blue King of the Delphiniums; Oceana is a grand deep violet double flowered delphinium. The gaillardias were superb, and notable varieties were Rose of Torridge, gold; Advance, scarlet, gold edged; Cleopatra, with tubular golden ray florets; Fleur de Lis, a fine combination of crimson-scarlet and gold; Primrose Dame, a descriptively named form. Aquilegias and campanulas also came from Langport. A handsome and effective group of plants, prettily arranged by Mr. E. Beckett, gardener to Lord Aldenham, Aldenham House, Elstree, was ever the centre of admiring visitors. Large arecas towered above stately liliums—L. speciosum and L. Harrisi—tuberoses, crotons brilliantly coloured, dracænas in many graceful varieties, Asparagus plumosus, kalosanthes, gloxinias and odontoglossums, arranged with dwarf ferns as a carpeting, and isolepis as an edging.

Mr. H. B. May, Edmonton, had a first-rate group of maidenhair ferns, the display including not less than ninety species and varieties of adiantum; notable examples that have originated at Edmonton were A. fasciculatum, A. cuneatum grandis, A. elegantissima, A. elegans cristata (a charming plant), A Regina, A. cognatum, an elongated A. scutum, A. plumosum, one of the very best for general use, and A. Hemsleyanum, one of the most graceful of maidenhair ferns and the best of the A. fragrantissimum seedlings. Hardy trees and shrubs from Messrs. J. Veitch and Sons included the lovely Styrax japonica, Robinia hispida, Indigofera decora alba, Hedysarum multijugum, Magnolia Watsoni, and the pretty Philadelphus coronarius erecta. Messrs. Barr and Son, Covent Garden, staged sheaves of fine delphiniums, irises in great variety, various liliums, poppies, pæonies in abundance, Heuchera sanguinea, pinks, veronicas, &c., and a fine form of Inula glandulosa. Messrs. G. Jackman and Son, Woking, showed delphiniums in variety, sweet peas, Eryrigium alpinum, pinks in variety, various lychnis, tritomas, liliums, campanulas, &c.; we noted several large bunches of the deep crimson single pæony Eclat. Campanula mirabilis, with palest blue flowers, is a meritorious hardy plant shown by the Messrs. Jackman.

A very bright and fragrant display of roses was arranged by Messrs. William Paul and Son, Waltham Cross, who had standard specimens of Medea, Enchantress, and other roses, also neat pot plants of Caroline Testout, Belle Siebright, &c The baskets of blooms were very fine, especially the displays of Victor Verdier, Gloire Lyonnaise, Grace Darling, W. A. Richardson, Blanche Double de Courbet, La Fraicheur, Safrano, Madame P. Pernet, Camoens, Enchantress, Empress Alexandra of Russia, Antoine Rivoire, White Lady, Queen Mab, Violette Bouyer, &c.—a glorious display of beautiful roses. Ten remarkably well grown plants of Phænocoma prolifera Barnesi served to show how grandly Messrs. Balchin and Sons, Hassocks, Hove, and Brighton, can manage these and any other plant they take in hand; the heads of the plants were a mass of rich, rosy flowers.

A brilliant bank of begonias came from Messrs. H. Cannell and Sons' Home for Flowers at Swanley, Kent; none but single varieties were staged on this occasion, and all were remarkable for their robust habit, sturdy flowers, and stout stems; the blooms were of great size and substance, especially those of Mrs. Herbert Frazer, salmon; Lady Lonsdale, old gold; The Lady, white; Mrs. Budley Leigh, rose; Brilliant, scarlet; Miss A. Stewart, soft yellow; and King of Begonias, bright orange scarlet. Messrs. Paul and Son, Cheshunt, put up a splendid bank of pæonies, showing all the best varieties, both single and double, in large bunches. Some roses, too, were shown by the Cheshunt firm, including Royal Scarlet, a brilliant single rose; and Rev. Allan Cheales, a fine rose-coloured rose of much sweetness.

A grand lot of pæonies came from Messrs. J. Veitch and Sons, Chelsea, who occupied over half the length of one table with these handsome flowers; Potsi superba, crimson; Maria Kelway, blush; Emile Lemoine, white; Rubens, deep red; and Mons. Deschamps, rose, were notably fine varieties. From the same firm came an extensive display of well-grown campanulas, representing the garden form known as C. medium calycanthemum. There were a fine variety of colours in this group, varying from white to rose and deep blue. A box of the javanico-jasminiflorum rhododendrons was most effective, and contained trusses of Maiden's Blush, Brilliant, Amabilis, President, Princess Frederica, Luteo-roseum, Indian Chief, and other beautiful forms. In competition for the Sherwood Cup, Messrs. J. Veitch and Sons had a large collection of annuals and biennials, staging campanulas. wallflowers, gypsophylla, schizanthus, sweet sultan, sweet peas, rhodanthes, linarias, antirrhinums, &c. They were the only competitors on this date. Sweet peas were largely shown by Mr. F. G Foster, Brockhampton Nursery, Havant, Hants. The bunches were very good for thus early in the season, and the colours were characteristic. Little Dorrit, Cardinal, Meteor, Lady Nina Balfour, Royal Rose, Salopian, Lady Grizel Hamilton, Mrs. Eckford, Mars, and Chancellor were among the best and newest varieties on view. The collection was a good one.

Mr. W. Howe, gardener to Sir H. Tate, Park Hill, Streatham, sent an inflorescence of Chamærops Fortunei, produced out of doors at Park Hill; it was an interesting male inflorescence, with yellowish flowers. Mr. Reid, Beckenham Hill Nurseries, showed small specimens of a number of hardy trees with coloured foliage. Mr. B. R. Davis, Yeovil, showed a splendid lot of tuberous begonias. Both double and single varieties were remarkable for the wonderful size and substance of the blooms; Orion, Miss L. Gott, Mrs. Herbert Fowler, Venus, R. B. Parsons, a lovely rose-pink; Florence Nightingale, white; Thunderer, red; and Miss Stothert, pale yellow, were all magnificent double varieties. Messrs. H. Cannell and Son, Swanley, presented three finely-coloured and large specimens of Lavatera arborea variegata.

Mr. W. Norman, gardener to the Marquis of Salisbury, Hatfield, put up a fine display of Malmaison carnations, small plants, but beautifully grown, and carrying an abundance of rose-pink blooms, large, full, and deliciously fragrant. A splendid bank of carnations was shown by Mr. C. Blick, gardener to Martin Smith, Esq., Hayes, Beckenham. This group contained a superb lot of Malmaison seedlings of fine form and colour. Mrs. Torrens, pink; Lord Welby, red; Lady Guniston, pink and scarlet; Calypso, white; Mrs. de Salgè, scarlet; and Margot, salmon-red were especially fine. A grand yellow carnation was Cecilia, large and full. Many of the varieties gained awards of merit, and are fully described elsewhere. A handsome group of carnations, a small edition of their Temple Show group, was put up by Messrs. W. Cutbush and Sons, Highgate. The principal display was of small specimens of Malmaison carnations, backed by bamboos, but these were relieved by mounds of other kinds, such as Prime Minister, scarlet; Duchess of Fife, blush; The Gift, scarlet; and The Churchwarden, deep scarlet. This was a very fine group. Messrs J. Peed and Sons, Norwood, showed a brilliant lot of carnations, the centre of the group being composed of the deep crimson-scarlet form, named A. H. Measures, this being surrounded by the fine deep rose-coloured variety named Rosamond; a pretty display of freely-flowered plants.

FRUIT AND VEGETABLE COMMITTEE.

The principal exhibit before this committee was that of nine magnificent Queen pines shown by Mr. Gleeson, gardener to A. von Andre, Esq., the Warren House, Stanmore. These fruits were finely finished, and averaged over five and a-half pounds each, consequently these were the heaviest set of this variety ever shown before this committee. It is a pity that these are the last pines Mr. Gleeson is likely to grow at Stanmore, as their cultivation is being discontinued at that establishment. Mr. J. Hudson, gardener to Leopold de Rothschild, Gunnersbury House, Acton, sent a remarkably good collection of tomatos, showing baskets of Sutton's Dessert, Golden Nuggett, Peachblow, Golden Jubilee, Abundance, &c.; Mr. Hudson also sent some extremely large fruit of Bigarreau de Schreken and Early Rivers cherries; these were picked from the open wall and not from pot trees.

Messrs. T. Rivers and Son, Sawbridgeworth, submitted a magnificent new peach named Thomas Rivers; it is a late variety of great size, and a beautiful colour; fruits were gathered from pot trees that were started in a forcing house on December 20, 1897; Cardinal and Early Rivers nectarines started at the same time were gathered in April and May. Cherry Guigne d'Annonay is a new early cherry, earlier than Early Rivers; it has dark, almost black, fruit, and was shown by Messrs. J. Veitch and Sons. Mr. G. Wythes, gardener to Earl Percy, Syon House, Brentford, showed some enormous fruits of Royal Sovereign strawberry, produced on plants grown as annuals. Mr. J. R. Rolfe, Stanford-le-Hope, Essex, sent a splendid lot of tomatos, the variety being named Rolfe's Challenge, a fine smooth tomato of rich colour.

MEDALS AWARDED.

Silver-gilt Knightian to Mr. Gleeson, gardener to A von André, Esq., Stanmore, for pineapples.

Silver-gilt Flora to Mr. Beckett, gardener to Lord Aldenham, Elstree, for group.

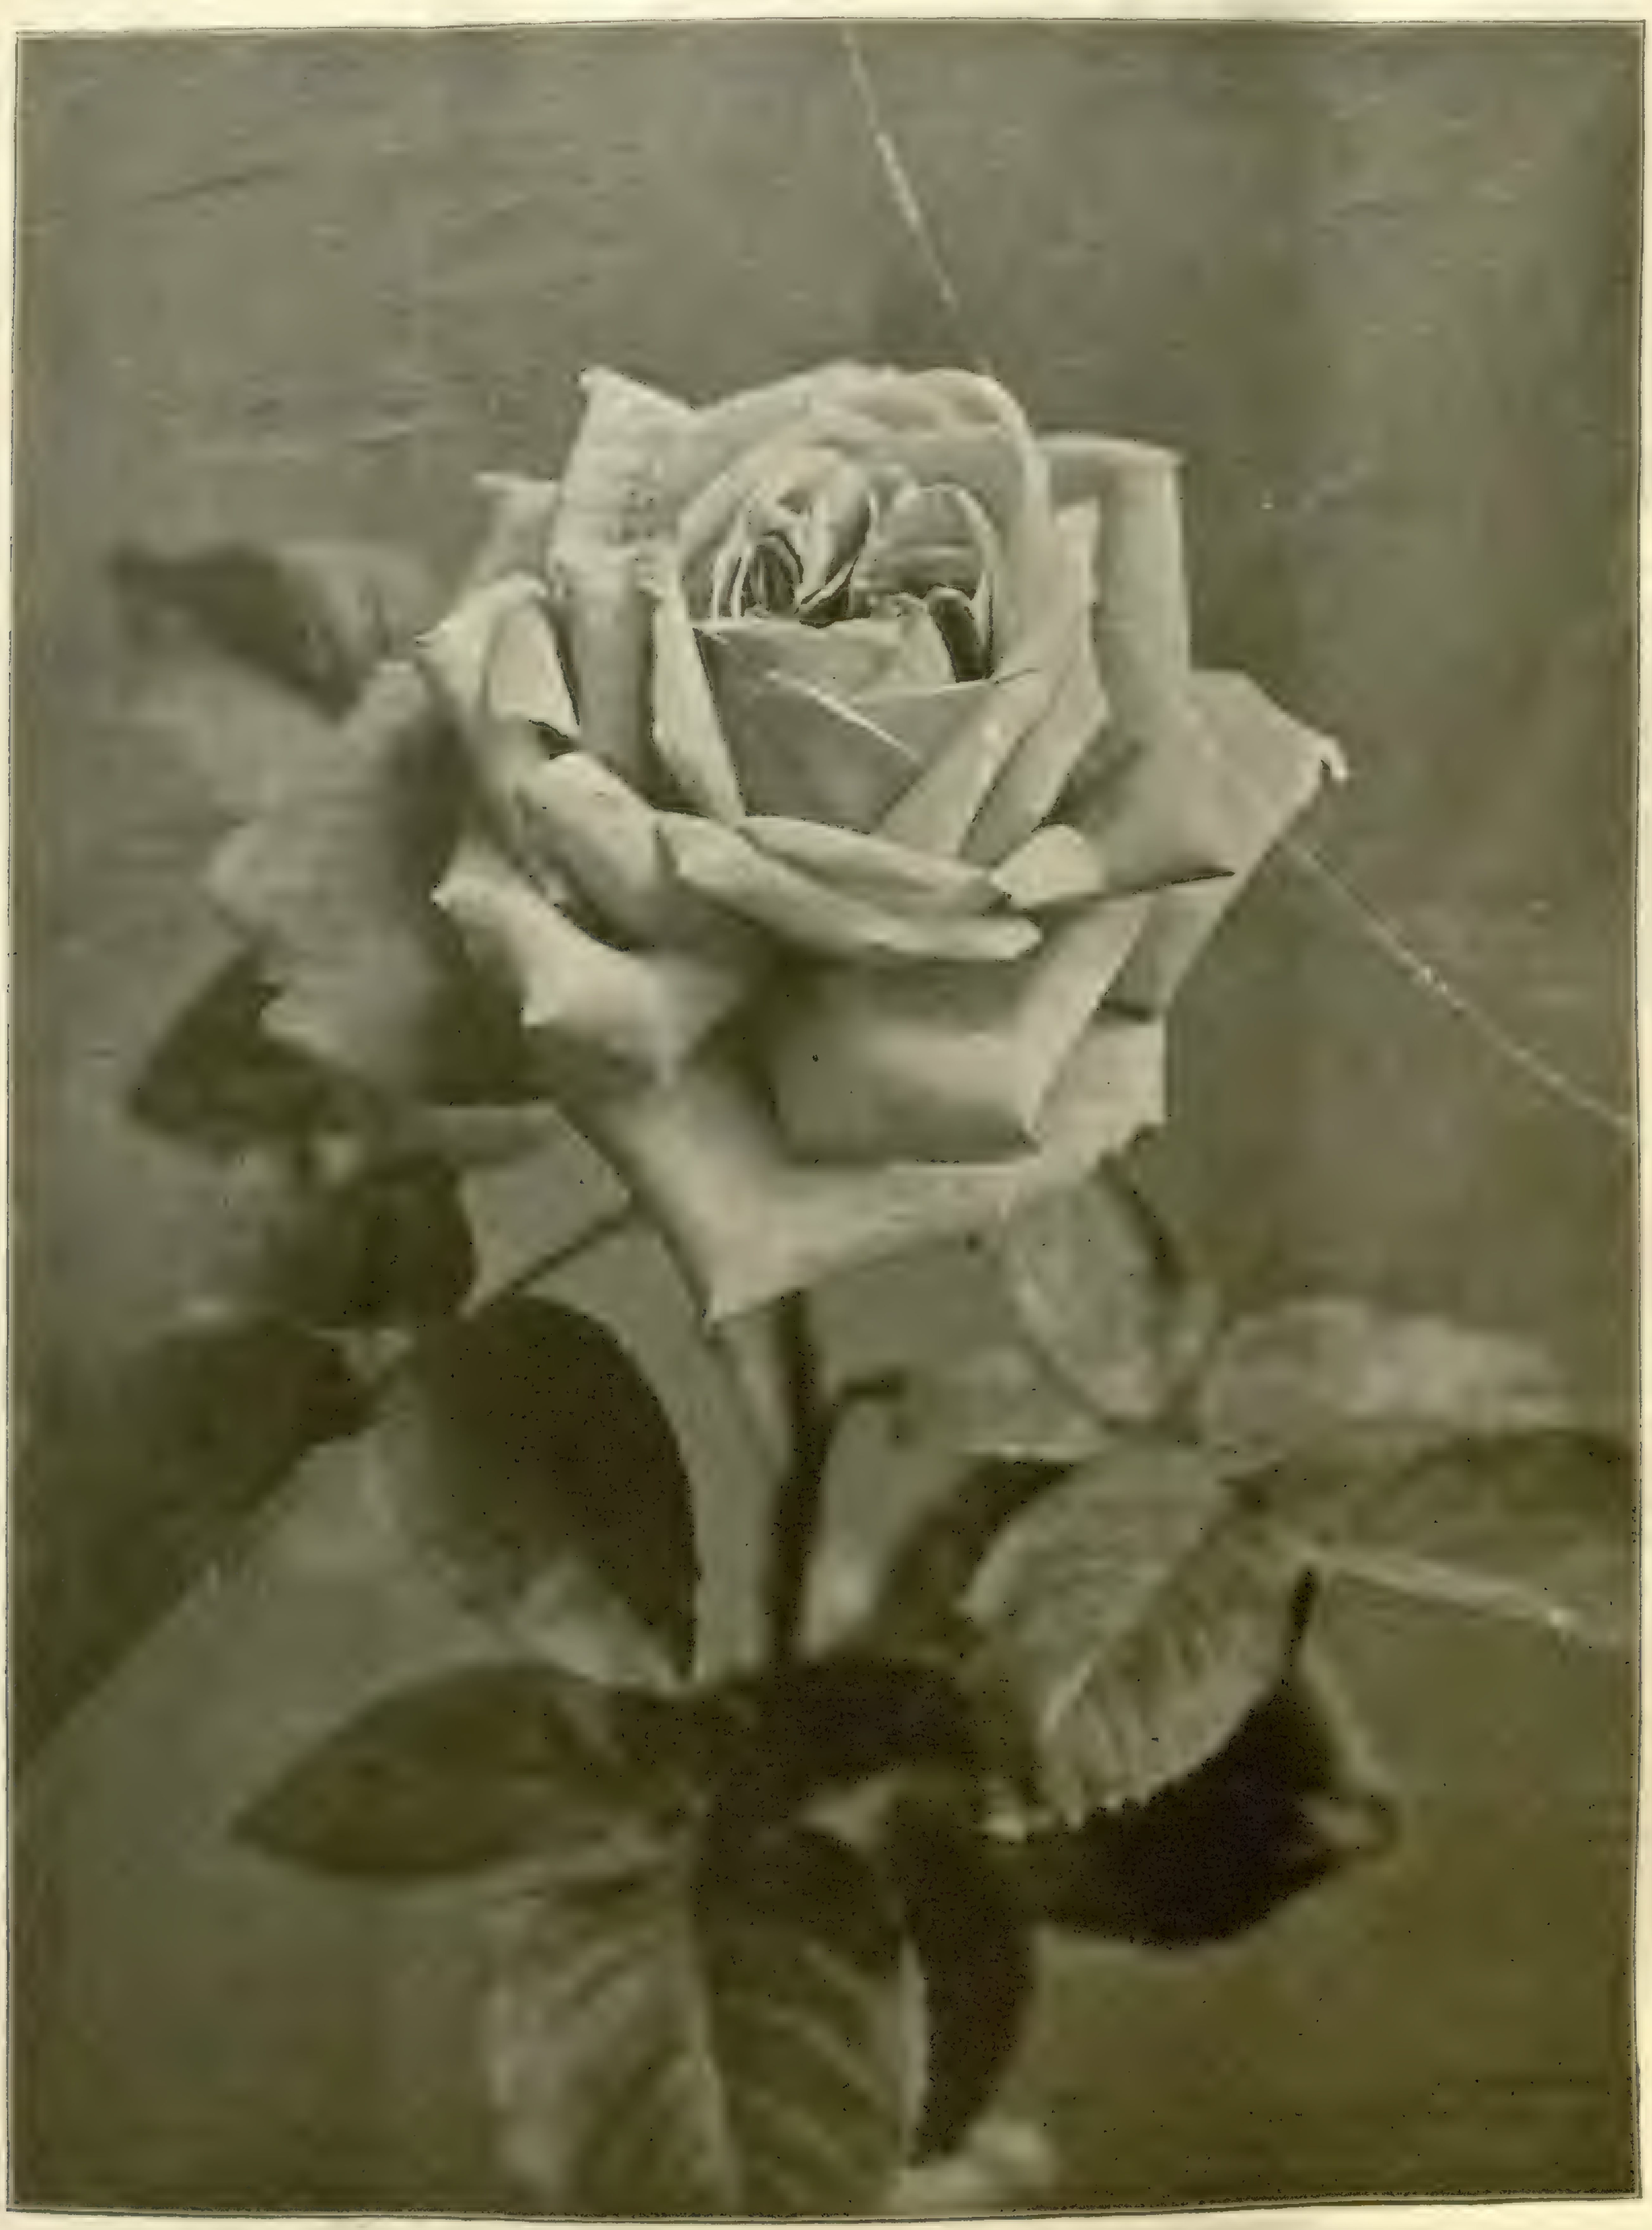
Silver-gilt Banksian to Mr. Hudson, gardener to L. de Rothschild, Esq., Gunnersbury, for cherries and tomatos; Mr. H. B. May, for ferns; and to Mr. C. Blick, gardener to Martin R. Smith, Esq., for carnations.

Silver Flora to Messrs. J. Veitch and Sons, for orchids; to Messrs. H. Low and Co., for orchids; Messrs. Kelway and Son, for pæonies, &c.; Messrs. W. Cutbush and Son, for carnations; Messrs. J. Veitch and Sons, for Canterbury bells; and to Mr. Norman, gardener to the Marquis of Salisbury, for carnations.

Silver Banksian to Messrs. B. S. Williams and Son, for orchids; Messrs. Stanley-Mobbs and Ashton, for orchids; Mr. B. R. Davies, for begonias; Messrs. R. Wallace and Co., for liliums and irises; Messrs. J. Peed and Sons, for carnations; Messrs. Paul and Son, Cheshunt, for pæonies, &c.; Messrs. Barr and Sons, Covent Garden, for hardy flowers; Mr. J. Hudson, gardener to L de Rothschild, Esq , Gunnersbury House, for water-lilies; and to Messrs. W. Paul and Son, Waltham Cross, for roses.

NEW ROSE—R. B. CATER.

At the time of his death, the late Mr. Henry Bennett left a considerable number of unbloomed seedling roses which represented his latest efforts in cross fertilisation, and contained several varieties of exceptional merit. A portion of the stock was purchased by Messrs. George Cooling and Sons, of Bath, and it is evident they were specially fortunate, for they have already been able to select three varieties for distribution which are generally recognised by rosarians as valuable acquisitions in their several lines of colour. They all belong to the hybrid perpetuals, and the varieties previously introduced are known respectively as Laurence Allen and Bladud, and both have been figured in the GARDENERS' MAGAZINE. Through the courtesy of Messrs. Cooling we are now able to present an excellent portrait of the third of the series which is now being distributed, and has the promise of proving not less valuable than are the other two varieties mentioned. This has been dedicated to Mr. R. B. Cater, a distinguished amateur rosarian of Bath, and it has already obtained a considerable share of attention. The flowers are of large size, globular, and of superb form, and the colour is rich magenta carmine. The variety is undoubtedly one of the finest dark hybrid perpetuals introduced of late years, especially for exhibition, and the Messrs. Cooling may be heartily congratulated on their being able to introduce so valuable a novelty.



H.P. ROSE.—R. B. CATER.

NOTES FROM IRELAND.

AMONG the principal hardy flowering shrubs this season Choisya ternata has flowered splendidly, in fact better than I have seen it for years. Cytisus scoparius Andreanus was charming with its mass of bicoloured flowers. Double cherries flowered well, as also have yellow and white broom, lilac, scarlet rhododendrons, laburnums, and hawthorns. A new acquaintance among deciduous flowering shrubs I have made this year is Amygdalus nana Georgica, a beautiful double white daisy-like flower. The shrub is very free flowering throughout the month of May. Cytisus ratesbonensis is another free flowering shrub in season at the same time. This is somewhat after the style of Andreanus, but paler in colour. Dodecatheon Jeffreyanum is doing exceedingly well here, producing splendid heads of red flowers on strong stalks, fully twenty inches high. I saw one of the prettiest sights a short time since that I have seen for a long time, viz., a shrubbery completely covered with a ground work of woodruff (*Asperula odorata*) in full bloom; it was like a bed of snow. Whether it will injure the shrubs or not remains to be seen; but both woodruff and plants were in the midst of health. Among other subjects worthy of notice may be mentioned Asphodelus albus and A. luteus. Another very pretty feature noticed in the same garden as the woodruff was an edging of thrift (*Armeria maritima*); this was a mass of lilac flower, about six inches high. The walk under notice was a very sunny one, and was formerly, I believe, a gravel pit; in any case it appeared to be the very place for the thrift. Lily of the valley flowered very indifferently with me this year. A charming yellow primula which grows here to a height of eighteen inches is P. luteola. Roses on walls are flowering splendidly; all the monthly or China roses are a mass of flower in beds; a few tea varieties are expanding in the open garden, while the hybrid perpetuals promise a good return in due course. Masses of Mrs. Sinkins pink are charming now, filling the air with their delicious perfume. Double rockets, iris in variety, single and double pæonies, day lilies, St. Bernard's and St. Bruno's lilies are making up the bulk of hardy herbaceous subjects yet in flower. Rhododendrons are flowering remarkably well this year. The strawberry crop will be a very heavy one. Apples, too, will be a first-rate crop, judging from present appearances. Raspberries are promising well. Cherries, I regret to add, have dropped practically all their fruit. Potatos have recovered from the damage incurred by the frost experienced during the middle of May, and are looking very well now. Peas and broad beans are producing excellent crops. The splendid weather we are now getting after the heavy rains suits all crops admirably. A terrific thunderstorm, lasting the whole day, passed over this locality on the 12th inst., accompanied by a deluge of rain. Agricultural prospects are exceptionally promising; the hay crop is an enormously heavy one, and is being well saved now during the fine weather. Wheat and oats look remarkably well. Mangolds came up weakly, but since the advent of warmer weather they have made good progress. Swedes, carrots, and parsnips are doing first-rate, and grass is everywhere very abundant.

Cretanstown Gardens. R. WELLER.

SETTING MUSCATS.

SOME idea prevails that Muscats must be very carefully handled during the blooming period, and that they must be brushed over with a camel's-hair pencil, fan or rabbit's tail, the latter being about the best for the purpose where its use is necessary. That young vines set better than old ones, is, I believe, taken for granted. This may or may not be correct, but in the free setting of Muscats none of these artificial devices are of material use if the roots of the vine are not healthy and active, nor is it so necessary to have the temperature of the house so hot and dry as is sometimes recommended, but I believe in not having the border really wet till after setting. At this time, they should have the first good soaking with tepid liquid manure, as this will at once start them with that vigour so necessary in Muscat growing—if the vines are healthy. I find a good and, perhaps, the best way to set them is to gently spray them with soft water from a syringe just before closing time, say, at two p.m. With this carefully done they set like Black Hamburgh. This spraying process may be done several times with distinct advantage, inasmuch as it clears away all rubbish and berries which do not set, and are so troublesome to the thinner. When these grapes fail to set well—and afterwards those left sometimes shank—it is a sure sign something is wrong with the roots or border—or both—and when the vine has lost that robust constitution it had better be rooted out and a new start made.

Vines last much longer on some soils than others. I know a large place, not many miles away, which was at one time noted for famous Muscats—they have not one on the place now, either young or old. Upon cold, badly-drained soils grape vines will not last in full vigour as they will on dry, well-drained soil, and all attempts to arrest them in their backward movement oftentimes prove futile. Of course, in their native countries, where they thrive and grow so well outside, they are chiefly planted upon sunny slopes, which are naturally well drained; in fact, it is well known that in several notable cases of old vines here at home the roots have rambled far away from the cultivator's control, and when they do this roots always always travel a long way in search of suitable food. Take any tree, plant, climber, or otherwise, when it has got beyond the limits of the border or flower how rampant they will grow, with much more freedom than when confined, and yet if the plant was given its freedom in the first place it would be ruined possibly.

Grape growing has of late years made rapid strides in this country, and bids to completely outdo all imports. The imported grapes will not bear comparison with our own home-grown produce, either in size or quality. Grape growing has become an important industry unknown to many gardeners, though many are fast becoming to learn the fact that they must produce grapes cheaper. Some of our wealthy proprietors are already alive to the fact that they can buy cheaper than they can produce; so gardeners must look alive that the market growers do not oust him from his position. On the other hand, the grower for market has large, roomy houses, and spares no expense in providing suitable manures for growing a heavy crop, and do not have to strain the vines by keeping the crop about on the vines as in the case of private growers; neither are the vines expected to last for generations. Grapes that cost 20s. per pound twenty years ago can now be bought at 2s. 6d. What a difference! But is it not so with all commodities of the present time?

Compton Bassett. W. A. COOK.

A Blue Geranium.—The public generally have become so imbued with the belief that the well-known variety of pelargoniums are all geraniums that it is very difficult to disabuse their minds of this notion. It does seem as if the appellation geranium would stick for all time. But there seems largely to be ignorance of what proper geraniums are, and although many may know the pretty Robertianum of the hedges to be a crane's-bill, they do not recognise it as a geranium. What, then, will they say on seeing the above heading. Certainly some will remark, and I know there are readers of the GARDENERS' MAGAZINE who are not professionals, that if there be yet no blue dahlia, or rose, or chrysanthemum, at least we have a blue geranium. That, however, is not a blue pelargonium, which seems to be as far off as the rose or dahlia. I have been led to these reflections when recalling the marvellous mass of colour, a deep rich blue, which I saw a day or two since at Messrs. Cannell and Sons' Eynsford seed farm. Here was a huge mass of some ten rods in area literally a solid body of blue flowers, a veritable spectacle, indeed. This big lot of beautiful, hardy plants, Geranium platypetalum, is not grown to produce seed, nor specially for stock, although that is abundant. The leafage in the autumn becomes very varied in colouration and exceedingly beautiful. This fact attracted the attention of an enterprising dealer, who now purchases the whole of the foliage as it ripens off and sends it to market. Apart from that very interesting feature, however, the plant is, indeed, a superb decorative one. I am sure of this, that could it be widely seen as I saw it the other day, it would be in universal request.—A. D.

FRUIT PRODUCTION.

THE question of flower-bearing in its relation to fruit production, which has often engaged the attention of fruit growers, was again raised by "A. D." (page 398). Of the fact stated that the most profuse blossoming periods is often followed by very moderate crops of fruit practical cultivators are generally agreed. In endeavouring to account for it not a few fruit growers seem to have anticipated Darwin's general theory of the struggle for existence. Granted that only a limited amount of protoplasum, sap, or growing force is available on each fruit tree or bush for conversion into fruit, and that these trees or bushes have each ten times or a hundred times the exact proportion is of little moment. If more flowers are presented than it can feed or satisfy, the excess must be starved, or withered, or blighted off. If, as we see, whether or not we have snap frosts or blighting winds or not, there are too many mouths in the feeding ground, and the weakest fall or go empty away. Nor is this all or the worst in the scramble and rush for food, the whole of the fruit may be starved off.

More mouths than food, hence the advocates of bloom bud and open blossoms thinning to fill with greater plenty the mouths left, and save the embryo fruits from sheer starvation. This theory thus stated seems sound enough, but somehow in practice the thinning of flower buds and blossoms has never become popular. Unless the cultivator's selection of fruit buds or blossom left for growing into mature fruits were identical with Nature's the bud and blossom-thinned trees would have fewer fruits than the unthinned. The cultivators need to know Nature's selections and Nature's favourites before he thins off freely, or otherwise, his redundant bloom buds or blossoms. Besides, modern science and practice has shed much new light on the nature and functions of bloom buds and flowers. During their early stages they are not depleting, but filling agencies of probably equal, perhaps more, subtle and potent force than the green leaves. Now, fruit buds or blossoms are by no means hungry animals, jostling and crushing each other for the first and deepest dip into the trough of vital life and being; but rather the powerful auxiliaries of roots and leaves, light and air, heat and moisture, and other stimulating forces that are constantly adding to and enriching the food supplies of our fruits and fruit trees. These coloured blossom buds and blossom perform through all their earlier stages the feeding and other functions of green leaves. Hence, the more of them the more food, and *vice versâ*, unless, indeed, it be contended, that the mere act of expansion of too many blooms may so strain the strength and waste the vital power of the trees as to cause the whole, or most of the flowers, to drop off. But so far as at present known, the mere expansion or development of buds into full-sized open blossom, puts no greater strain on fruit trees than the unfolding of their myriads of usual buds and leaves. And it would be as reasonable to thin leaves as blossom as a certain means of husbanding the vital energies of fruit trees.

As to the strength and vital force expended in these prodigal developments of fruit buds, this is mainly the gift of the previous season, rather than a drain on the resources of 1898 that the vital force needed to expand fruit buds. We have no proof that more is needed to develope these up to the stage of setting, than would be necessary to develope green leaves and yet we find that the buds or blooms, viz., the coloured leaves fall, while the green ones do not, though the foundation of the colour was well and truly laid by the autumnal sunshine of 1897, and could hardly exhaust the vital force or protoplasm of our fruit trees in the early months of the present year.

Of course I am well aware that not a few attribute the failure of profuse blossoming to ensure full crops of fruit, to previous starvation or overcropping. They do not believe in buds or blooms however numerous, starving or crushing each other off, until few or no fruits are left. But on the other hand almost all practical growers are forced to believe through bitter experience that an excessive crop the year before results in a scant or no crop the following season, and at times for two or three years in succession after the crushing crop. At times this scene of total sterility takes the form of a lack of bloom; at others there is an excess of bloom, too weak or imperfect to set or swell into perfect fruit. It is this last phase of partial or complete barrenness that puzzles cultivators the most. We can quite understand how trees over-fruited for one or more years should call a halt and demand a rest to recruit their health, or save or extend their lives. But why the trees should clothe themselves with sheets of flowers to be merely shed or cast to the earth seems inexplicable. Much of the shedding of fruit flowers originates, however, in overcropping or under-feeding. Fruit trees and bushes are endowed with the power of resenting either or both through the shedding of their fruit buds. To Nature the life and health of plants is of more moment than many crops of fruit, and hence their power of recruiting vital force by a spell of sterility. In these modern days of hurry and rush, the thinning of fruit buds and blossoms is too troublesome and uncertain to be generally practised and the fact established, which it is not, that over thinnings would check the plants in their more thorough proceedings in the same direction.

But the thinning of fruits in their earlier stages, that is at any time between their setting, stoning and swelling, to reasonable proportions is the size and strength of fruit trees and bushes, is the surest road to the reaping of annual crops of fruit of the highest quality. As to commercial value one perfect fruit is worth from three to six small, while the smalls may drain the tree of as much vital force as the fine or perfect fruit.

Fortunately, too, for the pockets and powers of cultivators, fruit trees and bushes suffer far more for the want of water than the lack of food. Drought at the roots shrivels off its thousands of blooms and embryo fruits to the trees starved off for lack of sufficient or suitable food in the soil. Water is food as well as drink to our fruits. Neither can they absorb and assimilate the other foods provided without the aid of its solvent properties and qualities.

D. T. FISH.

Fettes Row, Edinburgh.

FORGET-ME-NOTS.

The Forget-me-nots, or Myosotis, form a genus of either annual, biennial, or perennial plants, consisting of about fifty species, all of which are perfectly hardy in this country, and, with few exceptions, being rather showy and easily managed, are well worth growing, while owing to their adaptability several kinds can be bought in any flower market in quantity, either as plants or cut flowers. Some of the rarer alpine species, although of less easy culture, are, owing to their great beauty, never missing in any of the collections of rock plants. The annual and biennial kinds are increased by seeds, which are either sown as soon as ripe in the open on their respective beds, or in boxes or frames, and the seedlings planted out when the plants are sufficiently strong to bear removal. The perennial kinds are increased by cuttings and seeds, and with good varieties the increase by cuttings is the more preferable method, especially if one wishes to keep a certain large and free-flowering form, these being not always improved by seeding.

Myosotis alpestris, with its hairy, dark green oblong-lanceolate leaves, grows about six to nine inches high. It has sky-blue flowers, with a tiny yellowish eye, and these are usually disposed in terminal cymes. Flowering occurs during the spring and early summer, and some varieties have deep blue and others white flowers. It is a very variable species, from the mountains of Europe and Asia. M. rupicola is often given as synonym with M. alpestris, but it is certainly very distinct, differing in its dwarf habit, the plant being scarcely three inches high, and of very slow and compact growth; its flowers are large and sky-blue. It is a native of Scotland, but very local, and is best treated as a rock plant only. It flowers freely during the spring and early summer, and is a strict perennial.

M. lithospermifolia approaches M. rupicola, but is of slightly taller growth, and its leaves are longer and larger; it makes a beautiful rock and border plant, flowering in May and June. A native of the alps of Switzerland. M. palustris has spathulate, deep green leaves, and stems that are usually creeping, and but seldom over a foot high. Its flowers are bright blue, in long cymes, and produced through the spring and summer. Although a common British plant, being found in ditches and near rivers or lakes, it is well worth cultivating. A handful of flowers cut and placed in bowls in sand and water will keep fresh for weeks. The form M. p. semperflorens has been produced by cultivation, and there is also a very fine Continental garden form called grandiflora; this is a beautiful plant, the flowers being very large, and the stems attaining a height of one and half to two feet. It is certainly the best for cutting purposes. M. sylvatica, closely allied to M. palustris, has oblong-lanceolate leaves, and flowers in long racemes; the latter are deep blue, with yellow throat. Flowering occurs in the early spring, and the species is much used for bedding out and pot culture. There are several forms, and all are best treated as biennials.

M. azorica is a very erect-growing species, with stout stems half to one foot high, and large flowers disposed in close racemes; deep indigo blue. It flowers during the summer. The leaves are somewhat oblong or spathulate, hairy, and deep green. A native of the Azores. Excepting in the southern or western part of England, this species is not always hardy, and is best kept in pots and frames during the winter, and planted out in the spring. The form Imperatrice Elisabeth is less tall and compact, with graceful branching habit and deep blue flowers. This is summer flowering. M. dissitiflora has almost erect stems about a foot high; flowers sky blue. It is a very showy and useful perennial, well adapted for bedding and pot culture. M. dissitiflora grandiflora is a garden form with large flowers. This very popular market plant does not do well near large towns. M. dissitiflora elegantissima is a compact growing form with white margined leaves. M. Rehsteineri (M. cæspititia) has a creeping stem, and forms a dense carpet. For damp positions this charming plant cannot be surpassed by any other. In a private garden in Lower Austria I saw it used with great effect to cover a damp bank in a half shady position. When it was in full bloom I could not remember having seen anything more lovely.

M. cæspitosa is biennial, and a very local plant in the meadows of Lower Austria and Switzerland. The bright blue flowers are produced during the summer. M. nana (*Eritrichium nanum*) has a deep-growing woody root; leaves lanceolate-oblong, with short silky hairs, usually imbricated and forming a rosette. Flowers produced in terminal racemes, bright blue, produced during the summer. High Alpine of the Alps of Austria and Switzerland. This is a lovely, much-coveted plant, but, unfortunately, difficult to manage. In my early rambles on the Alps I often came across large groups of it, and seeing these plants growing, as they do, scarcely half-an-inch high, with their beautiful flowers, I used to take considerable trouble to remove them without much injury to the long, woody root, but even then I rarely had the pleasure of seeing them thrive in our garden. In a pure atmosphere and hilly country, such as Scotland, I have no doubt, with a little care, this plant might succeed, but never as a town plant. M. Traversi is of creeping habit, and has lanceolate-oblong leaves, hairy and scabrous, with a brownish shine; flowers yellow, produced freely in summer.

Nearly all myosotis prefer a fairly moist position in a good loamy soil. M. palustrus and allied kinds do best in bogs and shallow water.

G. Reuthe.

Almeria Fruits.—Besides the cultivation of grapes for market, Almeria is capable of growing many other kinds of fruits, such as bananas, custard apples, and Japan medlars; these are at present only grown in sufficient quantity for local consumption, and Vice-Consul Lindsay regrets that more attention is not paid to them. In 1897 the shipment of Almeria oranges was good, though there was a falling off by 7,000 cases in the export of almonds. Pomegranates and [illegible], however, were more largely produced, and cherries appeared for the first time as an article of exportation.

VEGETABLES FOR EXHIBITION.

Spinach.

Few green vegetables are more easy to obtain or more in request during the whole year than spinach (*Spinacia oleracea*), and in many establishments it is expected almost daily. The great secret in keeping up a constant supply is frequent sowings, and, except in November and December, it may be sown every month in the year. Any rich, well-tilled ground will produce good spinach. The first sowing should be made on a south border early in January, or as soon as the weather will allow, and small quantities of seed should be sown every fortnight till the end of October, in rows about fourteen inches apart. Spinach is frequently spoilt by overcrowding, as it soon becomes drawn and weak, and during the summer months quickly bolts to flower, so that, to produce the best results, it should be thinned to four inches apart. After the first two or three sowings on a warm border, single rows between the peas and runner beans is a capital place to produce it, as during the hot, sunny weather the shade from these crops is just what is required. This is my usual practice, and I can recommend its adoption. It is more difficult to produce good spinach during July and August than any other time in the year, and during June, and up to the middle of July, the seed is best sown on a north border, or some cool, shady part of the garden. The next two sowings should be made on an east border. For the winter supply a good breadth should be sown about the middle of August, and again at the end of the same month. Another may be made about the second week in September in an open position of the garden, after which three more small sowings should be made on a south border, making the last the end of October. The weather has so much influence on the growth of spinach that I have never found it safe to trust to one or two sowings. During the winter of 1897—98 our last sowing, made quite at the end of October, proved to be our best plantation during April and May. Very little attention is required after the crop has been thinned, except to run the Dutch hoe between the rows occasionally.

For exhibition purposes spinach is of little value and should only be included in a collection of vegetables of a stated number, as a last resource, but in a miscellaneous arrangement it might very well appear. The leaves should be large, of a good substance and dark green in colour, and should be arranged standing the ends of the stalks in a shallow vessel of water, as it so quickly flags, and this takes off that fresh appearance so essential in spinach. There are now several distinct varieties, many of these being a distinct improvement on the older. I have never seen any advantage in growing the prickly, or so-called winter spinach, as the round seeded kinds are equally hardy and of better quality. One of the best kinds that has lately come under my notice, is The Carter, a fine variety, distinct and of excellent quality. Victoria Round is also very fine, remaining for a much longer period than the older varieties before running to seed, and Sutton's Longstanding Round is also first-rate.

New Zealand Spinach.

New Zealand spinach (*Tetragonia expansa*) is quite distinct from the ordinary kind of spinach, both in growth and flavour, and during the summer months it often proves of much value. The plant enjoys a light porous soil and a sunny position, and requires abundance of water in dry weather. It is distinctly a summer vegetable and is of no use after the first frost. It may either be raised in heat under glass and planted out, or sown in the open the last week in April. It is a fast growing plant and should be sown in rows three feet apart, thinning the seedlings to two feet six inches. When well grown it is an attractive looking vegetable in the kitchen garden. During July, August and September, it should be included in a mixed collection of vegetables on the exhibition table.

Perpetual Spinach.

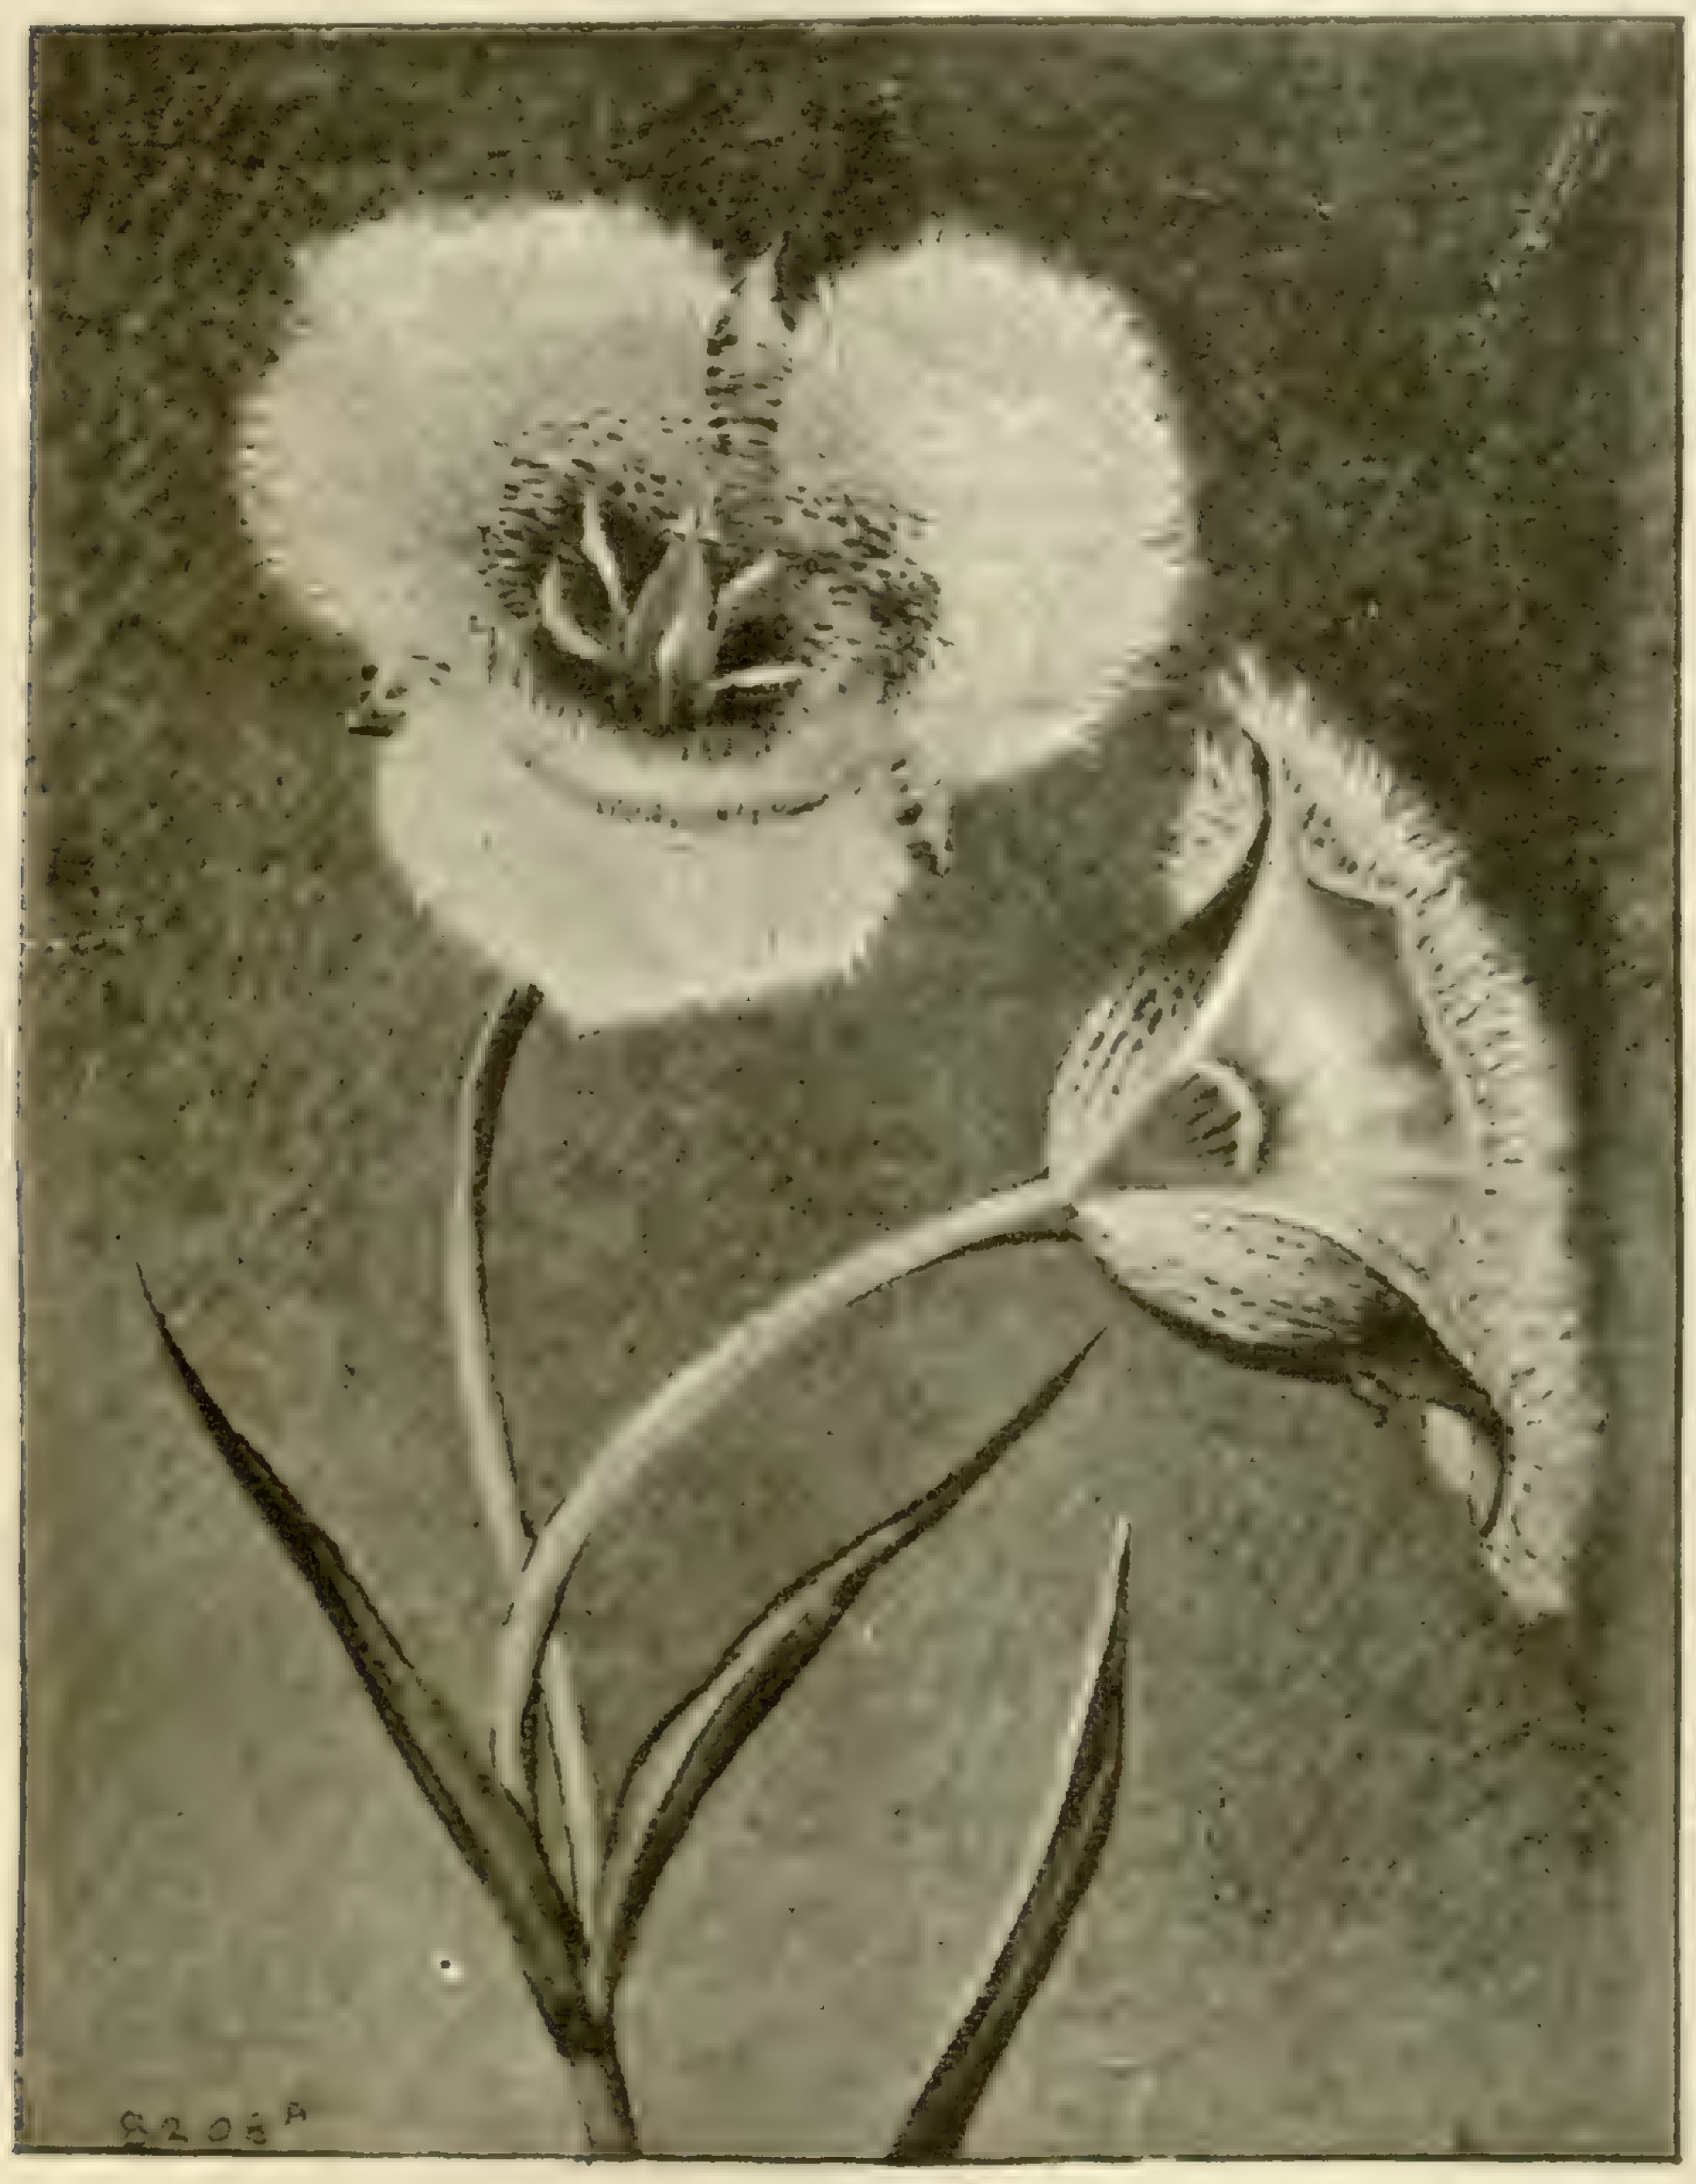
I can never understand why the Perpetual or Spinach Beet (*Beta cicla*) is called spinach at all, as it is distinctly a beet, except that of course the leaves are cooked the same way as spinach. In my opinion it forms but a poor substitute and is scarcely worthy of cultivation, but it requires little trouble to produce it. Two or three sowings should be made during spring and summer (the first in April and the last in August) on good ground at a distance of fifteen inches between the rows. Thin to nine inches between the plants, and make frequent hoeings to encourage a free growth, and keep the crop clean. This is all that is required, and for use, the leaves should be picked quite young.

Aldenham House Gardens, Elstree. Edwin Beckett.

Gloxinias at Swanley.—On my return from a recent lecture at the Swanley Horticultural College, I looked in upon that estimable florist, Mr. H. Cannell, whom regretfully we too seldom meet now at the Drill Hall. But no amount of inappreciation cools the enthusiastic ardour of this veteran and enterprising florist, who will, if not in person at least in produce, be always to the front. Few men have done more for horticulture, and especially amongst flowers, than he has. Of course, he has myriads of beautiful things to show to visitors, but to refer to one only, a house full of gloxinias, of such exceeding beauty that even an old stager such as I am, was surprised and intensely pleased. Here were numerous varieties in large blocks, and it is instructive to note the fine effects obtained from these brilliant flowers in such case. The variety that of all others most took my attention was Petunia, colour lavender-blue. a very striking and lovely colour that cannot be too highly prized. Her Majesty is still the finest white, and Beauty, intense blood crimson, is the richest dark, and wonderfully effective. Very fine and beautiful is Prince of Wales, flowers large, and of rich red colour. Amaryllis has a white throat and clearly defined lip, margin of same with a red ground. Mrs. Avery is similar, but has no margin of white. Amiable is a delicate soft pink, and exceedingly pleasing. Of blue shades, Mrs. M. Allen is a deep rich cobalt, with pure white margin; Maud has deep red spots on a pink ground; and Miss Tudor, a very fine flower, has red spots on a white ground. Of course there are vast numbers of seedlings all very fine, but any varieties propagated and in bulk show up with exceeding brilliance and remarkable effect.—A. D.

CALOCHORTUS PURDEYI.

SOME showier species and varieties of Calochorti than the one figured in the present issue have been introduced to cultivators by Messrs. R. Wallace and Co., Colchester, but none of them are more interesting than Calochortus Purdeyi. It is a strong-growing species, and one that all lovers of dainty hardy flowers should add to their collections; it grows about ten inches or a foot in height, and the growth is furnished with bright green and burnished foliage, linear and varying in size, the lower leaves being much larger than the upper ones. The stem is branched, and carries from six to twelve flowers that do not all expand at once, but continue the display over two or three weeks. The blooms are somewhat over two inches across when fully expanded, white, and covered on the inner surface of the segment with a profusion of silky hairs, these being a quarter of an inch in length. The hairs are white, except at the base of the flower, where they are claret-purple; there is also a large crescent-shaped claret-purple blotch at the base of each of the broad petals. Calochortus Purdeyi is a wonderful little plant, free in flowering, and extremely useful for association with the more brilliant-hued C. clavatus, C. Kennedyi, C. Plummeræ, the varieties of C. venustus, or the magnificent group of natural hybrids known as the Eldorado strain. All these are wondrously beautiful, not difficult to grow, and they are among the very best of flowers for table decoration.



CALOCHORTUS PURDEYI.

Fruit Prospects in Wilts.—I have made a thorough examination of orchard and all outdoor crops of fruit, and find upon the whole that we shall have a good supply, but not an extraordinary crop, as the amount of bloom indicated A very horrible drawback to the growth of the trees is the black and green aphis; I never remember seeing the apple trees so much attacked as the present season. The varieties which look the best are Kerry Pippin, Red Astrachan, Keswick Codlin, Wellington, Redstreak, Besspool, King Apple, Blenheim Pippin, Orange (Cox's) Pippin, Ribston, Cornish Gilliflower, Lord Derby, Hawthornden, Winter Hillier. These varieties look promising, and have set and are swelling a good average crop. Medlars are also promising well. Pears have not set so well as might have been expected, those on west and south-west walls being the best. Marie Louise have set and swelling away on a south well; also good crops are noted on such varieties as Louise Bonne, Cattilac, Pitmaston Duchess, Beurre Duel, Doyenne du Comice, Doyenne de Ete, Beurrè Hardy, B. Superfin, Winter Nelis, Glou Morceau, Ne Plus Meuris, Duchesse de Angoulême. Cherries are a grand crop, and the early varieties ripening well; late varieties look promising, and have set heavy crops. Gooseberries are a heavy crop and promise well. Raspberries are likewise better than for some years past. Strawberries are excellent; on that variety Grove End Scarlet was such a wealth of blossom that it called forth very special admiration, the bed was like a snow-covered plot. All other varieties have set well. Currants, both red, black, and white, are abundant, and if we can manage to keep in check the insect ravages we may rest assured we shall have some fine crops. Peaches, nectarines, and apricots have set well and look promising. Plums are the worst we have this season; these are exceedingly poor, though they produced a wealth of blossom.—W. A. COOK, *Compton Bassett, Wilts.*

TALL BEARDED IRISES.

NO more handsome, effective, and generally useful flowers have been flowering in our gardens during the past few weeks than the various forms of Tall Bearded Irises, which make up the large group popularly known as German Irises. The beauty of these fine hardy perennials is by no means over, and provided the weather is not too brilliant or dry, we may expect the later flowers to develop, and the later varieties to continue the display for another fortnight or so. As town plants these irises are scarcely to be surpassed, as may be readily judged by the success of the common blue flag iris that is ever popular, and where it will flower, practically all other varieties of this group will succeed, whether they be I. amœna, I. aphylla, I. neglecta, I. pallida, I. variegata, or I. squalens varieties. In the smokiest districts it would naturally be advisable to refrain from planting the palest and most delicate hued varieties extensively. A moist and good soil suits these irises best, but they are among the most adaptable plants, and do well almost anywhere and in every season; indeed, we have seen them flourishing quite close to large gas-works, and in the neighbourhood of many factories. A period of drought seems only to shorten the duration and size of the blooms, while they revel in a moist season; about the only weather that injuriously affects these beautiful flowers—for it does not affect the plants—is a driving wind accompanied by bright sunshine; this quickly spoils these and also most other flowers.

Visitors to nurseries and exhibitions will yet have opportunities of seeing for themselves which of these irises are most to their taste, and making notes of the same for autumn or spring planting—autumn if possible. A rigid selection of the best Tall Bearded Irises was given in the GARDENERS' MAGAZINE of June 13, 1896, p. 389, with descriptions made from plants growing in the R.H.S. collection at Chiswick. This collection is still very fine, probably the finest in the country, and if the first flush of beauty is now passed, there are still plenty of flowers to be seen, for the blooms open successively both on the plants and when the spikes are cut and placed in water in big vases. As an indication of the beauty of form and marking seen in these irises, the accompanying illustration of three distinct forms will serve in some measure, though sets of three, equally distinct, could be multiplied very many times. Those represented are Dr. Bernice, a tall, bold form, with ample rich coppery-bronze standards, shaded brown; soft crimson falls and dark golden crests; this is the central variety in the illustration. The variety on the left is that most lovely vigorous and lasting of irises, Walner, or Walneri as it is sometimes named; it has large blooms with broad graceful falls of a beautiful purplish lilac hue, and standards of a fine bluish lavender tint; tints sulphur coloured. The remaining variety is Victorine; this has white standards heavily marked with deep purple-blue; falls rather narrower than in the other forms, these are of an intense violet-purple shade towards the apex, shaded with crimson-purple, and veined at the base with white. These three varieties were especially photographed at Chiswick, from the R.H.S. collection, for the present illustration.

C. K.

PEACHES IN THE OPEN.

I WAS arrested by some startling remarks by Mr. Cook in a recent issue of the GARDENERS' MAGAZINE, as to covering peach blossoms. If he goes in for moderation he will carry the majority of growers with him. Though it is by no means clear why a single net two feet in front of the trees should prove a more safe or potent protection for peach or other blossom than a thin screen of boughs, of fronds of common bracken, or best of all, perhaps, asparagus tops, cut and dried before they are dead ripe. But Mr. Cook tells us that during the first week of May he cleared away all the fish nets which were hanging in front of the peach trees, and gave his trees a good washing with tepid water and carbolic soap, in the ratio of thirty gallons of water to two ounces of soap, to six trees. The following day the trees were washed again with thirty gallons more water, to which a quart of X L All Insecticide was added. These operations are to be continued at frequent intervals until the trees are completely cleared of aphis.

The point I specially note here is the earliness of the uncovering, though the use of lukewarm washings so early in the season might also be objected to. But uncovering in the first week of May is really like tempting the proverbial capriciousness of May weather to freeze the newly-exposed and tender fruit through their hearts. "Neer cast a clout till May be out." Never was given better advice for security than this during very ungenial May. Surely, then, this sudden uncovering in the first week of May, or the frequent insecticide washes afterwards, [illegible] have placed the newly bared trees at a striking disadvantage in holding their crops in health in the struggle with our erratic climate. But Mr. Cook does not seem to see it in that light, and hence, as he looks [illegible] on his anti-protection crusade, he sees the growing shoots affording far more protection to his peaches than his disunited nets did, which were two feet away, while the buds and shootlets hugged the trees close, [illegible] To which calls out, "This budding must be done as soon as possible." I will briefly answer, these leaves and shootlets, if clean and healthy, can do no harm to the trees for a while, but may, and often do, save peaches and nectarines or other fruits from late snaps of frost in May. Neither should disbudding resolve itself into a single act; but be a patient process performed tentatively, a few buds or shoots at a time.

On other points, such as the posting of young shoots, making selection of varieties, &c., I agree with Mr. Cook. But as not a few have lost their peach crops, or had these greatly crippled, either through non-protection or the premature withdrawal of protective material through this cold, harsh May, I felt compelled to object to Mr. Cook's [illegible] these points.

TALL BEARDED IRISES.

Walner. Dr. Bernice. Victorine.

WORK FOR THE WEEK.

WARM ORCHIDS.

LÆLIA PURPURATA and its varieties will have mostly finished flowering, and if repotting is necessary the present time is the best in which to do the work. If the compost is reasonably fresh and the drainage in good order, and the plants within reasonable bounds, they are far better left undisturbed until another season. A little fresh sphagnum and small pieces of peat may be placed in the holes to provide a neat appearance, and assist the young roots. Otherwise the plants must be thoroughly washed out, and every particle of the old material dispensed with. The new pots must be three parts filled with crocks, and of a size just large enough to allow for the rhizome to extend for a few years. Large pots which many amateurs use are very objectionable in various ways. They are unsightly, and the compost soon becomes sour, ultimately inducing a fungoid attack upon the tender roots. The compost used must be the best fibrous peat with all the fine dust shaken from it, and picked sphagnum, fixing several pieces of charcoal here and there. A shady place is required after potting, and a slight syringing occasionally all over, but water must be given sparingly until the new roots obtain a fair hold of the fresh material. The warm end of the cattleya house will be found the most suitable place for them. If in a bad state of health caused by old age, or by allowing the plants to flower too freely, year by year, it is advisable to treat them as imported plants, that is, supposing the varieties are worth the time and trouble, as it takes years to grow them into a flowering state again; if only common varieties, then burn them, as fresh stock can be purchased very cheaply, and will be of far more interest. Another orchid, which is of comparatively recent introduction, is Lælia tenebrosa, and it is one well worth cultivating, because of the charming colour of its flowers; its use as a parent will doubtless result in some of the best hybrids, both in colour and constitution. There is no mistake about it being a good seed bearer, and the seeds appear to germinate from this parent more successfully than from any other lælia. This lælia may be grown successfully along with L. purpurata, and the same treatment will suffice.

Some of the dendrobiums of the heterocarpum section, and the hybrids produced therefrom, will in many cases be finishing up their first bulb; if early flowering is desired they must be removed gradually to cooler quarters, and also given less water, in order to well ripen them for their flowering season; if not desired early, and a second growth is preferable, the specimens may stay in their quarters with all the dendrobiums that are growing, and where the syringe is freely used and abundant supplies of water given. More damping will be required now about the stages of the various houses than formerly, and pests must be kept down by fumigation.—THOS. STAFFORD, *Tyntesfield Gardens.*

CONSERVATORY AND GREENHOUSE.

FOR many weeks to come foliage plants of different kinds will play an important part in furnishing both the beds and side stages of the conservatory; indeed, in one respect we trust as much to these as flowering plants to keep up a varied display for overlooking the flower garden as most conservatories do where there will now be a blaze of colour. It is a pleasing change to look upon a well-grown batch of palms, ferns in variety, caladiums, coleus, and numerous other things which are admired for their foliage alone. Flowers there should be at all times, but pleasing features may be obtained by dotting these thinly between ferns and dwarf palms. What certainly looks out of place in the conservatory at this season—and they are still used in many gardens—is the common zonal pelargoniums, calceolarias, and lobelias; they make a display, certainly, but it cannot be called a pleasing one when such quantities are to be found growing profusely out of doors at the same time. A pretty group is formed by making a base of ferns and other dwarf plants and then dotting in a few plants of gloxinias, begonias, liliums, kalosanthes, or the summer-flowering heaths. An arrangement of this kind when lightly set up is much more striking than double the quantity of flowering plants crowded together, at the same time reflecting more credit to the grower and incurring much less labour on his part. Liliums as a rule grow and flower freely, but I have known whole batches prove useless owing to the flower buds turning yellow and dying off while in quite a young state. This may be the result of a sudden change of temperature by bringing the plants from a close, humid atmosphere and standing them in a dry, exposed position. Greenfly, too, if allowed to become established in the tips of the shoots either destroy the buds or cause the blooms to come deformed, while allowing the plants to become dry at the roots just as the buds are forming proves a serious error which no after treatment that season can rectify. These plants may be made to give a long display of bloom by gently forcing the most forward lot and retarding others. We have them now in several positions, but all the plants are treated generously as regards surface dressings and applications of liquid manure, while they simply revel in copious syringing after a hot day. This not only keeps the foliage clean, but also of a deep rich colour which shows off the flowers to the best advantage.

Kalosanthes, or crassulas, are now in full beauty and are useful for lasting in rooms, either as pot plants or in a cut state. Where large quantities of flowers have to be sent to the town residence, these are simply invaluable, as they travel so well, last a long time in good condition, while the colour and scent is most pleasing. We increase the stock each year, and yet never find we grow too many. They are easily grown and are certain bloomers if the proper attention is afforded the year previous to their flowering. The plants as they go out of bloom should be stood outside in a sunny position where the growths can be thoroughly matured, even lying the pots on their sides during a spell of dull wet weather to gain the object desired, but the roots should never suffer for the want of water, or the lower leaves fall, causing the plants to have a naked appearance the following season. Well ripened shoots may be taken in August, about six inches in length, free the lower part of the foliage and dibble about five cuttings in 48 size pots filled with rich loam and sharp sand. Plunge the pots in ashes in a cold frame. Keep the lights rather close and shaded for a time until the roots form, when the pots may be stood on a shelf in the greenhouse for the winter. It is a pity we see so few heaths grown now as compared with twenty years ago, especially the hard-wooded section. Where a small house could be devoted to these and these plants receive the right attention it would prove not the least interesting feature in the garden. The soft-wooded winter flowering sections still remains popular as they are so useful for decoration. Plants that were cut back after flowering and subsequently potted will now be the better in shallow pits or frames, standing the pots on a cool, moist base, gradually exposing the plants until in a few weeks the lights may be dispensed with for a time. Epacrises require much the same treatment, but established plants required to bloom early may now be stood in the open, and they commence to set their flower buds at once. The best acacias that are grown in pots for winter flowering, including the useful A. armata, may, where the plants have made a fair amount of growth, be also stood in the open, but before exposing such plants to the full force of the sun arrange them on the north side of a wall or hedge to harden them somewhat, for if this precaution is not taken the leaves are often injured and the plants disfigured.—R. PARKER, *Goodwood Gardens.*

THE FLOWER GARDEN.

A GENERAL clear up after bedding is necessary, and any work that had to be perforce set aside while this was going on should be attended to without delay. Box edgings, if not yet clipped, should be cut forthwith. Where a mulching has not been applied to flower beds, a stirring of the surface soil with a small hoe will assist in promoting a free growth, and also keep down small weeds. Remove any dead or decaying leaves and flowers. Peg down verbenas, laying out the shoots to cover the allotted space as much as possible. Calceolarias will the better withstand drought if mulched with some old mushroom-bed manure; part of the early flowers should be removed, and an occasional soaking of water be given in dry weather. Dahlias should also be mulched, and a neat stake be placed to each plant, to which the main shoot should be tied as soon as needing support. The young plants in newly-made violet beds are now fairly established, the former dull weather and showers having assisted in this development. A frequent hoeing or hand-weeding has been necessary, and with the advent of hot weather a thin mulch of leaf-mould or old mushroom-bed manure will assist in retaining moisture and encourage a free growth in the plants. This will also check the spread of red spider, which is liable to infest the foliage in dry weather. A syringing with Gishurst Compound or similar insecticide should be given if red spider is present, but with a mulching applied and kept in fairly moist condition this is seldom necessary. Climbers on walls, arches, &c., will need constant attention in tying and training the young growths. Clematis of the Jackmanni type should have the shoots tied or nailed up as often as necessary to prevent their breaking down or becoming an entangled mass. Plants of the early-flowering Clematis montana have mostly passed the flowering stage, and all the pruning that may be necessary should be done now before the new growths that produce the next year's flowers are made. Old neglected plants that have become a dense thicket of growths should be pruned in severely to the old wood, which will break freely, especially if water be applied to the roots and overhead in dry weather. Wistarias, climbing roses, loniceras, and other climbers making free growth should have the shoots tied or secured as required.

The propagation of spring bedding plants to be used for replanting the beds in the autumn for next season's display, by seeds, division, or cuttings as the case may be, should be carried on from the present time as opportunity offers. Pansy and viola seeds may be sown, choosing a shady border for the seed bed, if possible. Several useful subjects may also be easily raised in this way, such as myosotis in variety, Silene pendula, S. p. compacta, and wallflowers in several colours. Cuttings may be inserted of pansies and violas, Alyssum saxatile, aubrietias, Arabis albida, and varieties of double wallflowers, where propagation in this way is desired. These may be readily struck if inserted in moderately light soil, surfaced with a little sand, and covered with handlights or frames. A cool position should be chosen, one near the shade of a north wall or fence being the most suitable, as less shading is here necessary, and roots are formed sooner, especially if the weather be hot and dry. Old plants of violas and pansies laid in temporarily from the flower beds should be lifted and pulled in pieces, and the small young growths with bits of roots attached be selected and planted about six inches apart each way in suitable quarters, such as a north or west border. Press the plants in firmly and give a good watering as often as necessary. Double daisies, forget-me-nots, and aubrietias may be treated in the same way, all to be kept well supplied with water until partially re-established. Seeds of biennials, as Humea elegans, for use in the flower garden next year, should now be sown. Sow in a pan or box of light soil, and place in a cold frame, keeping it close and shaded until the seedlings appear. Canterbury bells in variety may be sown on the open border, and eventually transferred to flowering quarters. The handsome hybrid perennial aquilegias may be raised from seeds which if not already sown should be raised in boxes similarly to the humeas, and pricked off singly in the open border as soon as large enough to handle. Among these columbines are many beautiful combinations of colour, the flowers are light and elegant, and with the glaucous green foliage are very useful for cutting. In the rose garden considerable trouble has been experienced in keeping the attacks of green fly in check, dressing with quassia mixture, and washing with clear water being still necessary. Flowers are in a generally backward state. Standard and half-standard briars reserved for budding should have surplus growths removed, leaving two of the strongest and best placed for budding.—C. HERRIN, *Dropmore Gardens.*

HARDY FRUITS.

I HAVE rarely seen the trees so badly infested with blight as they are this season, and the fruit grower will need to be on the alert to prevent the pests destroying the crops, which are none too plentiful in many gardens. The apple and pear crops which promised so grandly are poor indeed, except in the case of a few varieties, such as the codlins or very early apples; but there are other [illegible] cases, and I would advise thinning the fruits of keeping varieties if the trees are bush or pyramid, and especially if young trees, as a medium crop of fine fruit is far more useful than a heavy one of small fruits. We are busy hand-picking our cordon apple trees, as the moth has badly infested the foliage and fruits, and it is well to remove infested fruits and leafage. Plum trees we have been obliged to cleanse, employing a strong insecticide to kill the pest. In our district the plum crop is a very spare one, no matter what position. The wall trees will need timely attention to stopping, laying in new wood wherever possible, as I find unless a goodly portion of new wood is made yearly, and a certain amount of old worn out spurs removed at the winter pruning, the crop is poor. It is full early to advise summer pruning, but much may be done to equalise growth over the trees by pinching and tacking in shoots where there is room. On the other hand, cordon trees are much best pinched frequently, to avoid a too free use of the knife. Peach and nectarine trees will need more attention with warm weather, and the trees are none too clean; both mildew and red spider are present, and some trees of Royal George were so badly attacked by mildew, that dry sulphur was useless, and we were obliged to use a solution to check this pest. With a better growth red spider will soon disappear, especially if the trees are syringed freely at sunset. We find it a good plan to use an insecticide once a week. The trees will be benefited by removal of all wood not fruiting or not needed for extension. Many peach trees on wall are much too thick at the top and thin at the base; [illegible] avoided by giving more room at the upper portion. The final thinning of [illegible] fruits should now take place, as there is no further fear of dropping. The [illegible] varieties are much later than usual this season, especially the Alexandra [illegible] Rivers' Early nectarine. To promote early ripening thinning of wood should not be delayed. We find it advantageous to lay in new wood early in the [illegible] I strongly advocate extension with peaches and nectarines, for it is surprising how well young trees thrive where the knife is used sparingly; let the [illegible] extend, as there will be less canker. It is surprising what large space a peach tree will cover if given ample space to develop.

Bush fruits, such as currants, will soon be approaching the ripening period, and will need netting to preserve them; and it is a great gain to the cultivator when the nets are placed sufficiently high to allow gathering without lifting them; of course, permanent wire protection is a long way the best, and probably quite as cheap in the end. Previous to netting it is advisable to cut back the new main growths to within four or five leaves from the base in the case of red and white currants; many object to this summer pruning, but I consider it does much good by assisting in ripening the fruit, removing insect pests, and rendering the fruit much easier to gather. Of course, black currants need more young wood, and these are best left; but in their case useless spray wood may be removed and more light admitted to the fruit. Cordon gooseberries are often grown on walls; these must be spurred back closer, only leaving three or four eyes; at the same time, it is necessary to train extensions to the wall, and, if necessary, thin the fruit on trees much crowded, especially those needed for late dessert, the thinnings being used at once. Cordon trees trained to stakes in open quarters will need similar attention in the way of pruning, and both these and wall trees will well repay for a good mulch of manure, as they suffer badly from drought and become infested with red spider. Raspberries will greatly benefit by mulching, and on our light soil we find cow manure excellent, and this is equally good for the other bush fruits noted. The later varieties will now need protection, and moisture also on light soils on gravel, as in our own case the plants have already shown the need of such, in spite of the heavy rain-fall early last month; but it should be borne in mind there is a great demand on the roots with the fruits swelling fast. When giving moisture, it is much best to give a thorough soaking than driblets occasionally; liquid manure may be employed if it can be given without touching the fruits, but it should be diluted. Give liquid manure to fruit trees of all kinds; bush or pyramid trees will take copious supplies, and, given a mulch, the soil will retain the moisture. Trees in orchards, with rank grass over the roots, are difficult to feed, but here much may be done with liquid manure, and I find it a good plan to remove the coarse grass near the stems in a two-ft. circle; give a mulch of manure, followed by liquid manure. Newly-grafted trees should be examined, and relieved of the binding material if the unions are complete; but should any doubt exist, it will be best to give support by ties and damp moss for a short time.—G. Wythes, *Syon Gardens*.

JAPANESE DWARFED TREES.

On May 26 and 27 there was a remarkable sale of these curious Japanese productions in New York City. Some five hundred were sold, and realized about 10,000 dols. (= £2,083).

This is the first sale of these curious nananized trees in this city. The north-east of Japan is famous for these arboreal curios, where for centuries it has been the proper thing for private people to have a few of these trees growing around and about their dwellings, forming miniature patches of exquisite landscape. True examples of such were seen at the World's Fair in 1893, in the horticultural building, and since that time there has been an increased desire for introducing these subjects into this country. Several Japanese agencies have opened up and others that were in existence before have launched out considerably, and big efforts on all hands are being made to popularise the trade. Doubtless, this exhibition and sale will give an enormous impetus to the business, but we are informed by Mr. B. Suzuki that the supply of these peculiarly trained conifers, except larch, is very limited, perhaps not more than 2,000 plants all told can now be found in the native home districts, but of the larix, maples, and the curiously trained Davallia bullata, there is an ample supply.

Returning to the sale question, the subjects that composed the bulk, and which commanded the biggest figures, were Thuya obtusa, Podocarpus macrophyllus, Sciadopitys verticillata, Buxus japonica variegata, Larix leptolepis, Rhapis humilis, and trained maples; one of these last, named Acer palmatum, realised 117.50 dols. (= £24 9s. 7d.), and the tree was not forty inches in height.

How the Trees are Dwarfed.

The pines may be considered the most important of all these trees in Japan, and great care is taken of their cultivation and preservation. The most popular ones are Pinus densiflora, Pinus sparsiflora and Pinus Thunbergi. They are generally grown from seed, and great care is taken to select the choicest qualities. In the spring of the second year, when the seedlings are about eight inches in height, they are staked with bamboo canes and tied with rice straw, the plants being bent in different desirable shapes. The next fall they are transplanted to a richer soil and well fertilised. In the following spring the plants are restaked and twisted and tied in fanciful forms. This mode of treatment is given until the seventh year, when the trees will have assumed fairly large proportions, the branches being trained in graceful forms, and the foliage like small clouds of dense green. The plants are now taken up and potted in pots one and one-half feet in diameter, and are kept well watered. Every succeeding year great care must be taken of new shoots, which must be kept pinched back. After another three years of this treatment, the trees are virtually dwarfed, there being no visible growth thereafter.

Grafted Trees.

Dwarfed Thuyas are effected by means of grafting. Let a Thuya seedling grow in the soil for three years, or until it becomes about five feet in length; then, in the middle of spring, cut off all branches, leaving the trunk and top branch; take a one-quarter inch chisel and hammer it into the thickest portion of the trunk, hollow out a one-inch deep hole to every two or three-inch space, so that the trunk can be bent more easily in the desired direction; rice straw is twisted round the trunk, which is bent in many curious forms and fanciful shapes. In spring-time of the second year of this treatment the plants are potted in rich soil; in another two years, when the plants have assumed permanent forms, Thuya obtusa is then grafted on the orientalis (pendula) stem.

The process of grafting is as follows: In early spring two-inch shoots of Thuya obtusa are cut with a slant and inserted one inch or so apart on the trunk of Thuya orientalis. The graft is bound round with rice straw which remains till the union is perfected. The plants to be grafted have already been provided with a frame made of bamboo poles and over these are thrown mats to shade from bright sun; these are removed each night. This makes the method much more simple than some Japanese and others have led us to believe.—*American Gardening*.

The Best Guide to the garden for the whole year is the "Gardening Year Book," containing practical articles on the cultivation of Flowers, Fruit, Vegetables, &c. Price 1s. "Gardeners' Magazine" Office, 4, Ave Maria Lane, London.—[Advt.]

INFLUENCE OF TEMPERATURE ON CROPS.

Of all the influences brought to bear on vegetable life by the atmosphere, that of temperature is, Mr. Mawley states in his paper on Weather Influences on Garden and Farm Crops the most powerful and far-reaching. Not only are plants affected by changes of temperature above ground, but its influence upon their roots is in most cases even more clearly to be traced. The fact is, each kind of plant and each function of its growth has its own particular requirements, as regards day and night temperatures, during its growing period; so that if these temperatures be exceeded or fallen short of, it does not thrive as well—too great warmth over-stimulating its growth, and too little checking it. Of course, the wider the departure from these special temperatures, the more will its growth be injuriously affected. Then, again, a certain degree of warmth must be maintained for a sufficient length of time to allow of any plant coming to maturity. For instance, maize can be grown as a fodder crop in this country, but it seldom, if ever, perfects its seed, owing to the shortness of our summers. If we trace the distribution of indigenous species of this and other countries, we shall find that each advances as far, and only as far, into higher latitudes or into elevated regions as it finds the amount of heat required to complete its growth and ripen its seed. From this we learn how important it is that the cultivation of those farm crops alone, which from experience have been found best adapted to our soil and climate, should be attempted. Of course, in gardens where extra care and attention can be given to each kind of plant, this caution may be to a great extent neglected. As a rule, a seasonable amount of heat is best suited in this country to a majority of our farm and garden products. That is to say, a gradual rise in temperature from the middle of January to the middle of July, and as steady a decline until the coldest period is again reached, would best meet their requirements. But, unfortunately, we can seldom count upon such favourable conditions being maintained for more than a few weeks at a time, the general tendency being at any season towards too great or too little warmth. Most of our field crops, with the exception of clovers and grasses, are annuals; whereas most of the plants grown in the garden excepting the kitchen garden are perennials, which require rest at some period of the year, and this, with few exceptions, they obtain during the winter months. Knowing as we do, how the atmosphere receives its warmth, not only from the direct influence of the sun, but from the heat it obtains from the ground, it will be readily understood how greatly the surface soil, particularly uncropped soil, becomes heated above that of the air. It is, however, not only the surface soil which becomes heated, for the warmth thus obtained descends to a considerable depth in the ground. So that the subsoil in this way becomes a storehouse of heat for plants to draw upon during the comparatively sunless period of the year; while it likewise serves by its lower temperature to keep their roots from becoming unduly stimulated during the summer months.

At one foot deep a clay soil—taking the year as a whole—is rather colder than the air, a sandy soil decidedly warmer, while a chalk soil is generally about the same temperature as the air. At four feet deep the ground is in all three cases cooler than the air during the period when most plants are in active growth (April—August), and warmer during the remaining seven months. These differences are greatest with a chalk soil; less with a clay soil; and least with a sandy soil. In fact, the soil last named is at four feet deep but little cooler than the air throughout a great part of the five warm months above mentioned, although decidedly warmer during the rest of the year. The greater the depth below the surface the more slowly are the changes above ground felt. For instance, taking one foot deep as representing the soil and four feet deep the subsoil, the former, like the air, is warmest in July; whereas at the depth of four feet deep the warmest month is August. Again, Mr. Symons has shown that at one foot deep the ground is coldest, as a rule, not during the night, but at nine a.m., and warmest, not at mid-day, but at nine p.m.; whereas at four feet deep the changes take place so gradually that there is no appreciable difference at any hour. It was found by Dr. Buchan, when discussing the temperatures of light and heavy soils, "that light soils are subject to a greater degree of frost near the surface than strong clay soils, but the frosts do not penetrate so far down into light soils as into strong clay soils, the explanation being that light loose soils are worse conductors of heat than strong clayey compact soils."

Investigations on the Continent appear to have shown that the rate of progress made by any crop is governed in a great measure by the duration or rather accumulation of temperature above or below the point at which active growth begins and is maintained. This critical point varies with different plants, but the Meteorological Office in its publications has adoped forty-two degrees as a sufficiently close approximation for most farm crops in these latitudes, and employs the method devised by Sir R. Strachey, F.R.S., by means of which the variations from this base are determined. Following the nomenclature adopted in the case of "foot-pound," General Strachey introduced the term "day-degree," by which is signified the continuance throughout twenty-four hours of an excess or defect of 1 degree from this base temperature of 42 degrees. The calculations are made as follows: Suppose the minimum temperature of the air on any day to be 50 degrees, the maximum 70 degrees, the mean 60 degrees. Since the temperature never fell so low as 42 degrees it is clear that it must have been effective as regards growth throughout the entire day; and since the mean for the twenty-four hours is 60 degrees it is also obvious that, if the base temperature of 42 degrees be deducted from that value, the difference plus 18 degrees will represent the accumulated amount of this effective temperature. On the other hand, had the readings throughout the day been below the base temperature the difference between the mean and forty-two degrees would show a defect of so many day degrees. In cases in which the temperature varies on both sides of the base the accumulated value is obtained by using a small factor. A table placed at Mr. Mawley's disposal by Sir Henry Gilbert, F.R.S., and reproduced in his paper, gives a very good idea as to how far such accumulated temperatures may be relied upon to furnish approximately correct results in this country. Those given in the lower part of the table are derived from the mean of the Meteorological Office estimates of daily excess at all the stations in England East and in the midland counties. In the first column the calculations date as in the *Weekly Weather Reports* from January 1; in the second from February 1; in the third from March 1; in the fourth from April 1; in the fifth from the period when the crop appears above ground; and in the sixth from the same period, but omitting those days which are too cold to allow of any progress being made. It will be noticed that, however calculated, the difference between the least and the greatest amount of accumulated heat required at Rothamsted in any year to complete the growth of wheat and ripen the grain was in all cases about 300 degrees, or about one-sixth of the total mean value for the eighteen years. This appears to Mr. Mawley a very large range indeed, and shows that such calculations can only be regarded as rough approximations, at all events as far as the leading cereal crop in this country is concerned.

NOTES OF OBSERVATION.

Parsnips.—Although Mr. Henslow recently stated that the Student parsnip, put into commerce some forty years ago, was raised by Professor Buckman, then of Cirencester Agricultural College, by constant and patient selection from the wild parsnip, I had always understood that it originated by crossing the wild parsnip with a garden variety. Without doubt, when first put into commerce it had special food excellence, in being whiter and of more solid or marrowy texture, than was the Hollow Crown or Jersey varieties. I am not sure that such distinction now exists. One Student may have developed the ordinary characteristics of others, whilst the others may have, by dint of selection, approached nearer to the excellence the Student originally borrowed. To secure fine roots it is hard to excel a good stock of the Hollow Crown; but the new Tender and True, which Messrs. Sutton and Sons have put into commerce, is better and whiter, and, if less large, is a more solid fleshed variety, and is becoming popular. A true stock of the Student, whilst having rather long, tapering roots, should have quite high or rounded shoulders, differing in this respect materially from the Hollow Crown. The coarse stocks known as Maltese and Jersey are not best fitted for garden culture. Elcombe's Improved, a stock that has long had high reputation, is but a good selection of the Hollow Crown. As with other roots so with parsnips, very much can be done to keep stocks up to a high degree of excellence by constantly selecting for seed production the most perfect roots for this purpose, not the largest; but those of medium size, solid, white, handsome, well shouldered, and not too long, make the best stock. Our seedsmen merit all possible credit for what they have done to improve vegetables in this way.—A. D.

Bougainvillea Cypheri.—This new form is likely to become one of the most popular of the bougainvilleas, as, though B. glabra is a favourite, the newer B. Cypheri is equally floriferous, and of a much brighter colour. I recently had an opportunity of seeing a large quantity of the new plant at Messrs. Cypher's nursery, Cheltenham, and was so much pleased with the splendid bracts that I consider it cannot be too generally known. In the colour of its bracts it is intermediate between B. glabra and B. speciosa; but it blooms more freely than the latter, and the bracts are of a brighter colour, and the foliage less spiny, not unlike B. glabra in the latter respect. It is invaluable for room decoration, as some bracts cut and placed in water remained in good condition for several days, without loss of colour or dropping. I note that it received a first-class certificate at the York Gala, and it is certainly worthy of award, as I never saw a plant with more bloom for the size, as small examples bloom freely, like the older B. glabra; it needs much the same treatment as the latter, and, given attention, will bloom a long time.—G. WYTHES.

The Royal Horticultural Society's Examination.—Now that the lists of successful candidates in the three classes of this annual examination has been published, I should like to publicly suggest that for the benefit of the Fellows of the Royal Horticultural Society, who may naturally wish to know whether the money expended over these examinations is beneficially applied or not, that the Council authorise the publication in an early number of the journal of the society of the papers sent in by the two leading candidates in each of the classes. As may be seen from the questions published that some, probably one half, are of a botanical or physiological nature, and somewhat outside of practical horticulture. In what are called "practice" questions the one relating to landscape gardening as an art is somewhat absurd in such an examination, as no one could give anything like an adequate reply, even if a practical one, in less than a long essay. With respect to the rest no fault can be found, as they all need in their answers undoubted practical knowledge. What I would like to learn is something of the nature of the replies given in the respective divisions, principles and practice, and in which section most weight of marks is given. Of course, the candidates well coached up in practice and theory make the biggest show, and that naturally leads to the inference that a higher number of marks was given to answers in that division than to those in the division of practice. Possibly such an assumption is wrong. If so, nothing would so much tend to disabuse persons of that assumption as the publication of the papers referred to with the number of marks given to each answer. I should have imagined that the council would have hastened to do what is suggested earlier. However, it is not too late to act upon it this year.—A. D.

Grape Growing.—Growers will, in the majority of cases, have good cause to remember the month of May and the early part of June for cold nights and want of sun, and damp atmosphere, each and all were against them. The only apparent gain has been in using the spare time in grape thinning which would in ordinary times have been occupied in waterings, &c. About once a week was the only time we could water, and, as a rule, before one house could be done the promise of a fine day had gone. Night firing has been a heavy item, more particularly as, owing to the Welsh strike, the usual supply of coal could not be obtained. In several cases mildew, both on foliage and berries set in, consequently painting the pipes with sulphur mixed with boiled linseed oil, was the order, followed by sharp firing for the night. With the extra night firing vine growth has been very rapid, and the weekly stoppings have been scarcely enough. June 7 was the first day of bright sunshine, but there is now a promise of continuous bright weather. Growers have much to contend with, for the conditions which prevent and cure mildew are likely to attract red-spider.—STEPHEN CASTLE, F.R.H.S, *Bottesford Vineries, Notts.*

Primula Sieboldi.—I have often thought when I have seen the large flat pan exhibits of the diverse varieties of this beautiful primrose, occasionally staged in London and elsewhere, that such methods of exhibiting them was calculated to detract materially from their popularity as greenhouse flowers. Clumps in six-inch pots, neatly grown and blooming well, very easy to obtain, dotted about amongst other plants in a house are really very charming, and many of the varied colours are highly meritorious. The best are the whites, roses, and reds, whether smooth-edged or lacinated. The reds, especially outdoors on rockwork, and where sheltered from cutting winds, make lovely objects. These primulas have had to give way to the sickly wild obconica, chiefly because it is so very easy to grow. My plan to secure good pot clumps was to stand those which had bloomed outdoors in a shady place, or in a frame facing north for the summer, keeping up strong leaf growth as long as possible. Then when the foliage had died away in the autumn, turning the clumps out of the pots, pulling the crowns apart, selecting the strongest, and putting them in the proportion of about nine into other six-inch pots, using, of course, fresh soil, and placing the smaller crowns rather more thickly into the pots. The former would bloom finely the following spring, the latter would grow into strong crowns, any bloom showing being picked out. In that way a fine show could always be obtained. If thus early potted clumps were placed in very gentle heat near the glass they would bloom quite early, others coming on in a cold frame making an admirable succession. So grown there is no element of flatness or monotony—quite the reverse.—A. D.

EXHIBITIONS AND MEETINGS.

ROYAL OXFORDSHIRE HORTICULTURAL SOCIETY, June 21.

THE midsummer exhibition of this society was held in the gardens of W[illegible] College, which has been placed at the service of the committee by the warden and fellows. Favourable weather prevailed during the afternoon and evening, and the attendance of visitors proved fully 50 per cent. more than last year. During the whole period of the society's existence its June shows have formed one of the events of the Commemoration Week, the attendance of visitors being always encouraging. In the past two or three seasons, however, since the eights week has occurred in May, the attendance has not corresponded with the increased expenses and [illegible] prizes offered with a view to make the shows attractive. Oxford gardens, with their lawns of velvet, are admirably adapted for flower shows, and [illegible] Wadham rank high as possessing a large number of specimen ornamental and timber trees. In the college portion are some remarkably fine cedars, c[illegible] beech (one of whose heaviest limbs is held in position by a natural union), [illegible] green oak, lindens, &c.; while in the warden's private garden (where the [illegible] are fixed) there are several evergreen oaks, a noble tulip tree, a Judas tree, English oak, beeches, weeping ash, a number of crimson thorns, guelder rose, deutzias, weigelas, and a fine pyramidal bush of cockspur thorn, now in full flower. N[illegible] the main walk are placed a trio of giant agaves, and the whole place reflects much credit on the gardener, Mr. Fortescue, who has charge of the ancient orchard, whose apple, pear, and walnut trees are of undeterminable age.

With reference to the show, it may be stated at the outset that very high quality prevailed, although the entries were not quite equal to an average, the [illegible] weeks of cold north-easterly winds and sharp night frosts having deterred the development of all out-door subjects.

OPEN CLASSES.—The schedule of prizes included classes open to all England, and in that, for an artistically arranged group of plants covering two hundred and twenty feet superficial, produced by two competitors, the first prize was awarded to Mr. James Cypher, Cheltenham, who harmoniously arranged a large number of choice subjects, including Bermuda lilies, richly coloured crotons, ixoras, small palms, ferns, and delicately veined, marbled and pencilled caladiums, mixed with orchids including cattleyas, cypripediums, thunias, vandas, oncidiums, dendrobiums, odontoglossums, and epidendrums, etc.; graceful bamboos. Hi[illegible] primroses, and other dwarf plants. The second prize was awarded to Mr. W. Vause, Leamington, whose design, though wonderfully effective and well arranged, was a trifle less elegant than the premier group. The central points formed a series of square headed arches resting on five pillars clothed in cork bark, the central column supporting a large specimen palm, the outer pillars being surmounted by neat feathery cocos; around and among these were distributed small examples of pandanus, coleus, crotons, caladiums, ferns, cannas, carnations, Acalypha musiaca, cattleyas, mixed with fuchsias, Humea elegans, Asparagus plumosus, all the pots were enshrouded in bark, and in every cranny and crevice bits of trailing and flowering plants depended; each specimen plant forming a moss-covered mound. The class for groups of tuberous begonias, included two very fine banks of scarlet, pink, white, salmon, crimson, and yellow forms of this popular flower, the ninety-six feet space allotted to each being a mass of colour intersected by adiantums and tiny palms, Mr. Johnson, Garsington Nurseries, taking the first. Mr. W. T. Mattock, Blenheim Nursery, Headington, second, his group being of excellent quality of bloom.

The class for a group of orchids covering seventy-two feet superficial was entirely in the hands of Mr. Cypher, who had lovely examples of Angulo[illegible] Clowesi, Brassia verrucosa, Cattleya citrina, C. labiata, C. lobata, C. Mendeli, C. Mossiæ, and C. Warneri; Cypripediums barbatum, C. nigrum, Elliottianum, C. hirsutissimum, C. Lawrenceanum, and C. Rothschildianum; Dendrobium Bensoniæ and B. Dalliousieanum, Epidendrums prismatocarpum and E. vitellinum majus, Lælia purpurata, Masdevallia Harryana, Odontoglossum [illegible], O. citrosmum, O. cordatum, O. Halli, O. hystrix, O. luteo-[illegible], [illegible] maculatum, and O. Pescatorei; Oncidium sphacelatum, T[illegible] Marshalli; Vanda suavis and V. tricolor; a most lovely collection, [illegible] first prize was awarded.

There were five exhibitors in the class for a display of roses, and Mr. W[illegible], gardener to the Duke of Marlborough, Blenheim Palace, securing the [illegible] award with a very tastily displayed arrangement of blooms covering seventy-two feet superficial; Mr. G. Prince second, and Mr. Walker, Thame, third. Mr. J. Mattock lost his chance of winning with a nice lot owing to having [illegible] palms and ferns as a background.

Tables decorated and laid as for dinner formed a good feature; [illegible] and Mr. W. T. Mattock secured the premier award with a very showy arrangement, the centrepiece being a pretty cocos embedded in a mound of blooms of Cattleya Mossiæ, slender spikes of Oncidium flexuosum, quaking and other grasses, the small goblets at the angles being filled with sprays of Odontoglossum citrosmum, white tea roses, and grasses. The second prize table, by Mrs. H. W. Morris, Thame, was a very airy arrangement of white, yellow, scarlet, and orange Iceland poppies, ferns, and grasses; the third prize, from Mr. W. Vause, Leamington, was somewhat too heavy.

MEMBERS' CLASSES.—There was only one group of plants for effect on space of one hundered and twenty feet, Mr. Johnson taking the card for a very excellent pyramid of healthy flowering and foliage plants, the centre of the design being a nice kentia. The show, decorative, and zonal pelargoniums, with the single and double blooms, were all very dwarf grown and freely bloomed, Mr. Walker [illegible]ing the premier in the three classes. Fuchsias were but few; Mr. Mattock [illegible] for six tallish pyramids; Mr. Joseph Bates, sen., second with smaller plants; but the three shown by Miss Greswell, Woodstock Road, Oxford, in the amateur division, were certainly the best bloomed specimens. Exotic ferns from Mr. John[illegible]son comprised specimens of large and fresh examples, Nephrolepis exaltata, Asplenium nidus avis being especially good; equally excellent were the [illegible] specimens of British ferns exhibited by Mr. W. F. Cross, C[illegible], Oxford. The single specimen classes contained a number of ch[illegible] premier stove plant from Mr. Mattock (Anthurium Scherzerianum) [illegible] developed spathes of brilliant cardinal scarlet; the second card bei[illegible] nice fresh example of Balfour's clerodendron; while for the third pri[illegible] nobile secured the card. For a greenhouse specimen the first card [illegible] Cymbidium Lowi from New Hincksey Rectory garden; Mr. J[illegible] second, with a well-flowered example of Statice profusa; a [illegible] fuchsia being awarded third. The premier foliaged specimen was C[illegible] Rothschild, exhibited by Mr. A. Ball, gardener to Mrs. H[illegible] Oxford. There were two very nice groups of six orchids, Mr. J[illegible] W. D. B. Curry, New Hincksey Vicarage, Oxford, dividing the [illegible] entrance to the tent were two large groups of carnations, [illegible] from the Blenheim Gardens, the blooms of the Mal[illegible] able for their size and depth of colour; the second prize set from Mr. Johnson comprising a larger number of varieties, but somewhat smaller flowers. The prizes in this class were given by Mr. Aubrey Harcourt, president of the society. In the amateurs' section, beyond the fuchsias above referred to, we noted a fine specimen of the New Zealand Flax (Phormium tenax), exhibited by Mr. W. F. Cross.

Among the cut flowers the bouquets appeared to arrest attention. That from Blenheim Gardens composed of roses well deserved the post of honour; Mr. Walker, Thyme, taking the second prize. In this class the Duke of Marlborough's gardener (Mr. Whillans) staged a beautiful posy of Princess Beatrice. Ladies' sprays were likewise very choice specimens of the florist's art, and a wonderful show of colour was produced by the collection of iris, pyrethrums, and the many herbaceous perennials. A few stands of pansies were presented of fair quality for the district, but the roses seemed to prove centres of attraction. Mr. Prince was awarded premier for twenty-four varieties and for eighteen tea-scented forms, the principal varieties being The Bride, white; Souvenir d'un Ami, pale rose; Souvenir d'Elise Vardon, creamy white edged rose; Madame C. Kuster, bright lemon yellow; Cleopatra, very pale pink edged rose; Comtesse Nadaillac, pale flesh coppery rose; Madame E. Lambert, flesh pink, shading white; Madame Hoste, pale yellow; Maman Cochet, soft rosy salmon; Maréchal Niel, golden yellow; Souvenir de S. A. Prince, a lovely white form; Innocente Pirola, pure white, fawn shaded; Ernest Metz, soft carmine; and Hon. Edith Gifford, white tinted salmon pink; each bloom of full size end fresh.

FRUIT constituted a small feature, but was on the whole very good. The grapes were Foster's Seedling, and Black Hamburgh; the melons were Hero of Lockinge; the strawberries were Royal Sovereign; the peaches were Bellegarde, Royal George, and Grosse Mignonne; the cherries May Duke; and the nectarines Milton and Lord Napier.

VEGETABLES, owing to the season, were only half an average number, although the cauliflowers, carrots, potatos, tomatos, and cucumbers left but little to desire, high quality ruling, especially in the classes provided by Messrs. Sutton and Sons, and Messrs. Webb and Sons. Mr. T. Lockie, Diddington Hall Gardens, secured Messrs. Sutton's premier; and Mr. C. Brook, gardener to Dr. Batt, The Hill, Witney, was awarded first prize in Messrs. Webbs' class, who offered prizes for nine and six dishes respectively. Mr. Lockie was also first for cucumbers with Royal Windsor, and for tomatos with Perfection. Amateurs and cottagers were well to the front, their products being altogether good; peas and beans were the exception on this occasion.

Among the extra productions exhibited may be mentioned a floral harp of white blooms from the Banbury Nurseries. Mr. Deverill, Banbury, also put up a long run of cut flowers. Mr. Montague Wootten staged a very fine double begonia, large spherical bloom of white, edged rose, and received a first-class certificate—a well-merited honour.

CROYDON, June 29.

THE Croydon Horticultural Society held its thirty-first summer show on the above date in the grounds of Brickwood House, Addiscombe Road, by kind permission of Percy T. Reid, Esq. It was a fairly good show though we have seen better at Croydon. The roses in the amateur classes were very poor as a whole, but fairly good for the men in the trade and open classes. The competition throughout was by no means keen. The arrangements were good, as usual in the hands of Mr. A. C. [illegible]y.

GROUPS AND PLANTS.

There were three large groups arranged on a space not exceeding eighteen feet by fourteen feet, and here the first prize was awarded to Mr. J. Harris, gardener to P. Crowley Esq., Waddon House, Croydon; this was a good exhibit and contained a bright lot of cattleyas, odontoglossums, masdevallias, gloxinias, caladiums, cannas, &c., tastefully disposed amid ferns, palms, crotons, caladiums, &c.; the white lilium were most effective. Mr. C. Lane, gardener to C. H. Coles, Esq., [illegible]wood, Upper Caterham, came second; one or two early chrysanthemums were rather novel in this group. Mr. J. W. Hicks, gardener to D. Lord Esq., [illegible] Cresent, Sydenham Hill, third. Mr. Harris gained a first prize for half a dozen dracænas with specimens of Gladstoni, Vivicans, Majestica, Regalis, [illegible], and Amabilis, all well grown and coloured. Mr. J. W. Hicks was first for half a dozen caladiums, and Mr. G. West, gardener to T. F. Lynch, Esq., South Norwood, second. Mr. J. Harris scored for a specimen ornamental foliage plant with a handsome example of Cycas reaoluta. For a specimen flowering plant Mr. C. Lane was first with Bougainvillea glabra and Mr. Harris second with Rhyncospermum jasminoides. Mr. G. Prebble, gardener to M. Hodgson, Esq., Shirley, staged the best half-dozen coleus in close competition, with Mr. T. F. Lynch, second. Zonal pelargoniums were bright and free flowered though not very large plants; Mr. C. Lane scored for six single varieties and also for six ivy leaved varieties. Mr. C. Perrett, gardener to Mrs. Fuller, Duppas Hall, showed the best six fuchsias, strongly grown specimens.

Mr. J. Harris, gardener to P. Crowley, Esq., was awarded a first prize for six exotic ferns, the large specimens being Davallia polyantha, D. Mooreana, D. fijiensis, D. fijiensis elegans, Adiantum fragrantissinum, and A. gracillimum. For a small group the prizes in order were awarded to Mr. A. Dyer, gardener to T. Peacock, Esq., Chichester Road, Croydon; and Mr. G. Earles, gardener to J. Glaishert, Esq., Heathfield Road, Croydon. Mr. W. Sparshott, gardener to Mrs. Hall, Stanton House, Park Hill Rise, was easily first for nine tuberous begonias with handsome and well-grown plants; Mr. C. Perrett, second. For nine ferns in six inch pots Mr. J. Harris scored with well-grown adiantums, pteris, gymnogrammas, and nephiolepsis. Gloxinias were very good, Mr. W. Sparshott leading with dwarf and freely-flowered specimens; Mr. G. Lewry, second; and Mr. T. [illegible], Brickwood House Gardens, third.

Table plants were best shown by Mr. Eales. Mr. J. Slater, gardener to F. [illegible], Esq., H[illegible]dale, Park Hill, Croydon, had the best table group, but such [illegible] as here understood are by no means useful or attractive. Mr. W. Gladwell, gardener to S. Smith, Esq., Werndee Hall, South Norwood, staged the best table of gloxinias arranged with foliage plants; Mr. A. Dyer, gardener to T. Peacock, Esq., Croydon, second.

CUT FLOWERS.

Mr C. J. Salter, gardener to T. B. Haywood, Esq., Woodhatch, Reigate, was the only exhibitor of twenty-four bunches of stove and greenhouse flowers with a splendid collection of cypripediums, cattleyas, odontoglossums, gloxinias, phalænopsis, masdevallias, gloxinias, &c. Table decoration were light and pretty, [illegible] exceptional excellence; Mrs. A. C. Robinson, Wallington, coming first; [illegible] Mrs. Ralph Thrale, Coombe Road, Croydon, second.

ROSES.

The amateurs' challenge cup, valued at twenty-five guineas, was secured by Mr. A. Slaughter, Jarvis Villa, Steyning, who was the only exhibitor of thirty-six [illegible]. The specimens were not very good, but the best varieties were Mrs. Sharman Crawford, Dr. Andre, Marie Cointet, Eugene Furst, Violette Bouyer, A. K. Williams, Captain Christy, Dupuy Jamain, General Jacquiminot, Anna Olivier, and S. M. Rodocanachi. Mr. Slaughter also gained the first prize for twenty-four roses, Charles Lefebvre, General Jacquiminot, Fisher Holmes, Anna Olivier, Mrs. Sharman Crawford, and Marie Van Houtte were the best examples. The first prize for twelve roses of one variety was won by Mr. E. M. Bethune, Denne Park, Horsham, who showed very fair examples of A. K. Williams. Mr. P. G. Burnand, Hill Grange, Reigate, won first prize for a dozen roses distinct with moderately good specimens of Duke of Edinburgh, La France, Gustave Piganeau, Catherine Mermet, Pride of Waltham, A. K. Williams, Roseriste Jacobs, Dupuy Jamain, Horace Vernet, General Jacquiminot, La France No. 2, and Prince Camille de Rehan; Mr. Bethune came second; and Mr. E. Mawley, Rosebank, Berkhamstead, third, with a set that contained eleven tea-scented roses. Mr. Bethune scored for a dozen tea or noisette roses with neat blooms of Comtesse de Nadaillac, Marie Van Houtte, Souvenir d'un Ami, Niphetos, Madame de Tartas, Madame Hippolyte Jamain, Hon. E. Gifford, Anna Olivier, Medea, Catherine Mermet, Madame Bravy, and Perle des Jardens; Mr. E. Mawley, second. In a class for four trebles open only to growers of less than two thousand plants, Mr. P. G. Burnand led the way with nice flowers of Caroline Testout, Gustave Regis, Comtesse de Nadaillac, and A. K. Williams; Mr. E. Mawley second with Marie Hoste, Souvenir de la Malmaison, La France, and The Bride; Mr. Bethune second. The first prize was apparently withheld in the class for nine roses, but Mr. D. W. Freshwater, Reigate, and Mr. F. W. Amsden, Croydon, gained second and third respectively. Mr. Freshfield was also awarded a second prize for nine tea or noisette roses, and Mr. Amsden a third, the section being for growers of less than a thousand plants. Among growers of less than five hundred rose plants, Mr. W. D. Freshfield, The Wilderness, Reigate, gained first place for six blooms with fair specimens of Grace Darling, Magna Charta, Kaiserin, Augusta Victoria, Violet Bowyer, Gustave Regis, and Jeannie Dickson; Mr. Keppel S. Gifford Edenson, Sutton, second. Mr. Freshfield scored for six tea or noisette roses with Maréchal Niel, Marie Van Houtte, Rubens, Anna Olivier, Bouquet d'Or, and Niphetos.

The local challenge cup for the best twelve roses, distinct, brought three competitors, but Mr. A. C. Gifford, Cornwalls, South Norwood, had no difficulty in winning with good specimens of Gustave Piganeau, Alphonse Soupert, Charles Lefebvre, Caroline Testout, E. Y. Teas, Madame Gabriel Luizet, Captain Christy, Prince Camille de Rohan, A. K. Williams, Dr. Andry, Jeannie Dickson, and Grace Darling; Mr. M. Hodgson, Shirley Cottage, Shirley, second; and Mr. Amsden third. Messrs. Hodgson, A. C. Gifford, and F. Amsden were awarded prizes in the order of their names for half a dozen blooms in a local class. Mr. Hodgson had the best six tea or noisette roses, and Mr. Amsden came second.

In the open section Messrs. F. Cant and Co., Colchester, beat Messrs. Prior and Son, Colchester, for forty-eight roses, with a very even set of blooms, the varieties being: Back row—Dupuy Jamain, Princess Beatrice, Duke of Wellington, Cleopatra, Duke of Bedford, Jeannie Dickson, Helen Keller, Caroline Testout, A. K. Williams, Mrs. Frank Cant, Camille Bermardin, Madame G. Luizet, Victor Hugo, Marchioness of Dufferin, Marquise Litta, and Mrs. W. J. Grant; middle row—Marchioness of Downshire, Duke of Albany, Ethel Brownlow, Captain Hayward, Marguerite de St. Amand, Medea, Devoniensis, Crown Prince, Mrs. S. Crawford, Auguste Rigotard, Ernest Metz, Beauty of Waltham, Rubens, Alfred Colomb, Prince of Wales, and Francois Michelon; front row—Niphetos, La France, Abel Carriere, Comtesse de Nadaillac, Dr. Andry, Catherine Mermet, Reynolds Hole, Souvenir d'un Ami, Prince Arthur, Maréchal Niel, Duke of Teck, Jules Finger, Madame Cusin, Maman Cochet, Dr. Sewell, and Suzanne Marie Rodocanachi. For twenty-four roses distinct, three blooms of each, there were but two competitors, Messrs. Frank Cant and Co., Braiswick Nurseries, Colchester, came first with good flowers of Mrs. W. J. Grant, Duke of Wellington, Viscountess Folkestone, Duke of Connaught, Beauty of Waltham, Marchioness of Downshire, Clara Watson, Prince Arthur, Maurice Bernardin, Lady Mary Fitzwilliam, Crown Prince, Rubens, Fisher Holmes, Maréchal Niel, Souvenir d'un Ami, Cleopatra, Captain Hayward, Mrs. Sharman Crawford, General Jacquiminot, Souvenir d'Elise Vardon, Dr. Andry, La France, Mrs. Frank Cant, and Duke of Teck; Messrs D. Prior and Son, Colchester, second.

Mr. J. R. Box, Croydon, won the leading award for twenty-four roses distinct, with a fair set that consisted of Magna Charta, Margaret Dickson, Horace Vernet, Spenser, Senateur Vaisse, Lady Mary Fitzwilliam, Duke of Edinburgh, Maman Cochet, Mr. Sharman Crawford, Villaret de Joyense, Souvenir d'un Ami, Fisher Holmes, Kaiserin Augusta Victoria, Comtesse de Ludy, Violet Bouyer, General Jacquiminot, Souvenir de Dr. Gaimain, Elie Morel, Beauty of Waltham, Blairi No. 2, Miss Ethel Brownlow, Dr. Sewell, Madame Gabriel Luizet, and Abel Carriere; Mr. A. G. Green, Great Horkesley, Colchester, second; and Mr. T. Butcher, Shirley, third. Messrs. D. Prior and Son, won the first prize for two dozen tea and noisette roses with pretty box that contained Caroline Testout, Madame Cusin, Ernest Metz, Souvenir de S. A. Prince, Inncente Pirola, Devonienses, Souvenir d'Elise Vardon, Marie Van Houtte, Hon. E. Gifford, Souvenir d'un Ami, Madame Hoste, Cleopatra, Maman Cochet, The Bride, Amazone, Madame Bravy, Rubens, and Anna Olivier; Messrs. F. Cant and Co., second. For a dozen roses of one variety, Messrs. D. Prior and Son won with fine flowers of Mrs. W. J. Grant. The best dozen blooms of any one tea or noisette rose came from Mr. A. G. Green, Colchester, and were a good set of Souvenir d'Elise Vardon; Messrs. D. Prior and Son, second, with Souvenir de S. A. Prince.

FRUIT AND VEGETABLES.

For strawberries, Mr. C. Blurton, gardener to H. Cosmo Bonsor, Esq., M.P., Kingswood Warren, was first with a good dish of Royal Sovereign; Mr. G. Prebble second, and Mr. O. Jeal third with the same variety. Mr. O. Jeal, gardener to Miss Waterall, Waddon Lodge, Croydon, had the best pair of cucumbers; Mr. G. Eales, gardener to J. Glaisher, Esq., Croydon, second. Mr. D. Osman, Ottershaw Park, was the first for a melon.

Mr. J. Friend, The Rooks Nest, Godstone, showed the best three bunches of white grapes, showing Foster's Seedling; Mr. W. Lintott, Marden Park, second; and Mr. Bethune third. For black grapes Mr. C. Blurton was easily first with nicely finished Black Hamburgh; Mr. Osman second, and Mr. J. Friend third.

Mr. J. Johnson, gardener to Mrs. Crawley, Bramley Hill, Croydon, had the best collection of vegetables, showning good tomatos, cabbages, peas, onions, and turnips. For a collection of six varieties only Mr. C. Perrett scored with a good exhibit. Mr. C. Lewry was also a successful exhibitor of vegetables.

TRADE EXHIBITS.

Hardy flowers in quantity were shown by Messrs. Barr and Son, Covent Garden, their group including a collection of pæonies and the new and beautiful Philadelphus Lemoinei. A group of well-grown double and single begonias was exhibited by Messrs. J. Laing and Sons; the varieties were most effective, especially the pink Lady Giffen. Messrs. H. Cannell and Sons, Swanley, made an effective display of tuberous begonias, staging the handsome group of first-rate double sorts in lovely colours. Hardy cut flowers were well and extensively shown by Messrs. J. Cheal and Sons, Crawley; the Spanish irises and the violas were especially attractive, and the latter afforded a most agreeable fragrance. Tuberous begonias from Mr. H. J. Jones, Ryecroft Nursery, Lewisham, consisted of stocky, free-flowered, and young plants of both single and double varieties representing a first-rate strain; there were some very distinct bicolor forms, having pink inner segments and scarlet outer ones, others with large white centre and scarlet border; the pink varieties, both single and double, were especially good. Mr. J. R. Box, West Wickham, showed well-developed hardy flowers, and a splendid group of begonias, tastefully arranged around a centre of tall and graceful palms and dracænas. Mr. T. Butcher sent floral decorations, and Mr. G. Cooper staged specimen pelargoniums.

RICHMOND, June 29.

THIS successful suburban society held its twenty-fourth annual show in the spacious grounds of the old Deer Park at Richmond. It was a first-rate show, and being in a fashionable centre the tradesman were well represented, and their exhibits assisted largely to make the display so fine. Roses were good, much better than at Croydon.

ROSES.

The class for forty-eight trebles at Richmond is possibly the only one of its kind in the country; there were several competitors, and Mr. B. R. Cant, Colchester, secured the fine silver cup offered as first prize by Mr. and Mrs. A. Chancellor, the Mayor and Mayoress of Richmond. His varieties were Ulrich Brunner, Mrs. Sharman Crawford, Gustave Piganeau, Cleopatra, Clara Watson, A. K. Williams, Madame de Watteville, Dupuy Jamain, Henrich Schultheis, Kaiserin Augusta Victoria, Victor Hugo, Duchesse de Vallambrosa, Madame Gabriel Luizet, Duke of Edinburgh, Annie Laxton, White Lady, Mrs. W. J. Grant, Souvenir de S. A. Prince, Niphetos, Madame Cusin, Captain Hayward, Anna Olivier, Prince Arthur, Lady Mary Fitzwilliam, Dr. Andry, Antoine Renoire, Comte Reàmband, Souvenir d'Elise Vardon, The Bride, Marie Verdier, Suzanne Marie Rodoconachi, Souvenir d'un Ami, Duke of Wellington, Rubens, Marie Baumann, Margaret Dickson, Crown Prince, Maréchal Niel, Violette Bouyer, La France, General Jacquiminot, Marie Van Houtte, La Fraicheur, Caroline Testout, Souvenir de la Malmaison, Helen Keller, Mrs. J. Laing, Marquise Litta; Messrs. F. Cant and Co. a close second, and Messrs. D. Prior and Son third. The best twenty-four roses, distinct, three blooms of each, were staged by Messrs. D. Prior and Son, Colchester, who won with charming blooms of Marie Van Houtte, Prince Camille de Rohan, Marchioness of Devonshire, Fisher Holmes, Caroline Testout, Tom Wood, Prince Arthur, Rubens, A. K. Williams, Souvenir d'un Ami, Marchioness of Dufferin, Dupuy Jamain, Duke of Edinburgh, Mrs. W. J. Grant, Souvenir d'Elise Vardon, Mrs. S. Crawford, Violette Bouyer, Helen Keller, Lady Mary Fitzwilliam, La France, Mrs. J. Laing, Souvenir de S. A. Prince, and Ulrich Brunner, all good flowers; Messrs. F. Cant and Co. second. In an amateurs' class for a dozen blooms the winner of the first prize was Mr. W. Romanes, Old Windsor, who showed very fair specimens of Captain Hayward, Madame Lambard, Hon. E. Gifford, Maman Cochet, The Bride, and Charles Lefebvre; Mr. P. Kitchen second, and Mr. West third.

Mr. R. E. West, Reigate, was first in a special class for a dozen tea and noisette roses, with a pretty set; Mr. J. B. Marsh, Claygate, second. Mr. West was also first in a special class for twenty-four roses, showing fine flowers of Madame Gabriel Luizet and Baroness Rothschild. The best twelve tea roses of one variety were lovely blooms of Rubens, staged by Messrs. F. Cant and Co., Colchester; Messrs. D. Prior and Son, Colchester, second, with Souvenir de S. A. Prince. The best twelve blooms of a H.P. rose were brilliant examples of Duke of Edinburgh, shown by Mr. B. Cant, Colchester; Messrs. F. Cant and Co., second, with Mrs. W. J. Grant; and Mrs. Messrs. Paul and Son, Cheshunt, third, with Rev. Allan Cheales. Mr. Charles Turner, Royal Nurseries, Slough, was a good first for a dozen treble trusses, showing very fresh flowers of Gustave Piganeau, Caroline Testout, Duke of Teck, Mrs. S. Crawford, Souvenir de P. Carnot, Duke of Edinburgh, La France, Duke of Wellington, Marie Baumann, Mrs. J. Laing, Marchioness of Downshire, and Ulrich Brunner; Messrs. D. Prior and Son, second, and Messrs. F. Cant and Co., third. In the local amateur classes for roses, first prizes were scarce, but seconds were awarded to Mr. W. Jones, gardener to J. Wigan, Esq., Mortlake, in two classes.

GROUPS AND PLANTS.

A charming group of Malmaison carnations won for Mr. Farr, gardener to A. Pears, Esq., the first prize in its class; the young plants shown were well grown, and carried fine full blooms, deliciously fragrant. Mr. C. Want, gardener to Sir F. Wigan, Bart., J.P., Close Lawn, East Sheen, won the chief honours for a group of flowers arranged for effect, putting up a pretty display, in which odontoglossums, Gladiolus The Bride, crotons, and gypsophylla figured freely. Mr. G. Watts, gardener to H. Little, Esq., Baronshalt, Twickenham, won first place for half-a-dozen specimens of zonal pelargoniums, showing very fine examples of J. Miller, S. Birkin, and several seedlings. The first-prize group of tuberous begonias was staged in a half-circle by Mr. Johnson, gardener to D. H. Scott, Esq., Old Palace, Richmond; the blooms were of fair size and very bright, Mr. C. Turner, Slough, gained first prizes for six show pelargoniums, and for the same number of fancy forms, showing lovely specimens, all one mass of flowers. Mr. J. Wiggins, gardener to W. Stacy, Esq., West Drayton, was second for show pelargoniums, with well-grown specimens. The chief honours for six exotic ferns were won by Mr. Farr, gardener to A. Pears, Esq., Isleworth, who staged Asplenium bulbiferum, Dicksonia antarctica, Davallia fijiensis, Phlebodium aureum, Nephrolepis exaltata, and Davallia bullata. Mr. Gibson, gardener to A. H. Watts, Esq., Devonhurst, Chiswick. The best half-dozen specimen foliage plants were sent by Mr. Vause, Leamington, who showed Croton Andreanum, C. Warreni, Phœnix dactylifera, Kentia Belmoreana, K. Fosteriana, anti Latania borbonica. Mr. Vause was the only exhibitor of large specimen stove and greenhouse flowering plants, and the set of six that secured him the chief prize were were freely-flowered examples of Bougainvillia glabra Sanderiana, Statice profusa, Aphelexis macrantha rosea, Stephanotis floribunda, Dipladenia boliviensis, and Erica ventricosa grandiflora.

Mr. H. E. Fordham, the Nurseries, Twickenham, arranged a charming group planof ts on a space not exceeding one hundred square feet. It was a full semicircular arrangement of crotons, cattleyas, carnations, and gloxinias, set in a bed of maidenhair fern, over these were arranged graceful panicles of gypsophylla, and this had a most charming effect; a few graceful palms, tuberoses, and liliums rose amid and above the other subjects, and the whole produced an exceedingly pleasing effect; Mr. M. Vause, Leamington, second; Mr. J. Russell, third. The first prize for six orchids was won by Mr. A. Howard, gardener to H. Little, Esq., Baronshalt, Twickenham, who staged fine examples of Cattleya Warneri (with fourteen flowers), C. gigas, C. Mendeli, C. Mossiæ, Lælia tenebrosa grandis, and Cypripedium Veitchi; Mr. W. H. Young, orchid grower to Sir F. Wigan, Bart., Clare Lawn, East Sheen, came second with Lælia tenebrosa, Cattleya Mendeli, Cypripedium Rothschildeanum, Cattleya Mossiæ, C. Warneri, and Ærides Fieldingi. Mr. R. Johnson led in the class for a dozen tuberous begonias, and Mr. A. Meaton, gardener to J. B. Hilditch, Esq., Asgill House, Richmond, scored for half a dozen coleus, with finely coloured specimens. Mr. Ellis, Hounslow, had the finest nine gloxinias, a good set; while Messrs. J. Allsop and C. Want took first and second prizes respectively for caladiums. Mr. Allsop, gardener to W. Cunard, Esq., Orleans House, Twickenham, had the best half dozen palms, Mr. Farr coming second; Mr. Farr scored, however, for a single specimen foliage plant with Asparagus plumosus, and for a palm with Cocs plumosus.

Messrs. Barr and Son, Covent Garden, staged the best two dozen bunches of hardy flowers, setting up good masses of Inula glandulosa, Iris orientalis maxima, Eryngium alpinum, Potentilla Rollisoni, Linaria macedonica, Erigeron glabellus, delphiniums, Spanish iris, English iris, pæonies, poppies, Phlomis Russelliana, Heuchera sanguinea, Cypripedium spectabilis, &c.; Messrs. Paul and Son second; and Messrs. A. W. Young and Co. third.

VEGETABLES AND FRUIT.

In the class for a collection of vegetables, provided by Messrs. Sutton and Sons, Reading, Mr. C. J. Waite won first prize with fine Supreme potatos, Early Gem carrots, Perfection tomatos, Sutton's Magnum Bonum cauliflowers, White Leviathan onion, and Duke of Albany peas, all grand produce; Mr. J. Gibson, gardener to A. H. Watts, Esq., Demonhurst, Chiswick, second; and Mr. Foulkes, gardener to C. E. Strachan, Goddesden Place, Hemel Hempstead, third. Mr. C. J. Waite was also first for a collection of nine dishes of vegetables, a popular class provided by Messrs. J. Carter and Co., Holborn; his Early Morn peas and Mont Blanc cauliflowers were first-rate; Mr. J. Gibson second; and Mr. A. Bastile, gardener to the Rev. O. Powell, Weybridge, third. In the society's class for twelve dishes of vegetables the first prize was won by Mr. C. J. Waite with a fine group of produce; Mr. Bastile second; and Mr. J. Gibson third. Mr. J. Osman, Ottershaw Park, Chertsey, had the best collection of fruit, showing Buckland Sweetwater and Black Hamburgh grapes, Hero of Lockinge melon, Brown Turkey figs, Royal George nectarines, and Violette Hâtive peaches; Mr. Ellis, Hounslow, second. Mr. Blake, Clandon Park Gardens, Guildford, was first for black grapes with Madresfield Court. Mr. Osman first for white grapes with Buckland Sweetwater. In other fruit classes Mr. Meaton gained firsts for black and for white grapes; Mr. J. Gibson was first for two dishes of strawberries, with President and Royal Sovereign in fine condition; Mr. Farr scored for a single dish of strawberries, with good fruits of President; Mr. Bolton led for peaches with Stirling Castle, and Mr. Allsop for nectarines with Early Rivers; and Messrs. Sallows and Ellis scored respectively with cucumbers and tomatos.

MISCELLANEOUS EXHIBITS.

One of the finest of trade displays came from Mr. J. Russell, Richmond, who showed a tasteful group of well-grown and finely-coloured hardy plants of value, by reason of their bright or variegated foliage; cornus, Japanese maples, enonymus, ivies, golden oaks, &c., were most pleasingly associated. Messrs. F. Sander and Co. staged new plants in abundance. Mr. W. Thomson, Sheen Nurseries, Richmond, put up large groups of Hydrangea paniculata, spiræas, and bamboos. A bright group of orchids came from Messrs. B. S. Williams and Son, Holloway, and contained good specimens of Cypripedium Lebandyanum, Lælia purpurata, Aerides Fieldingi, &c. Messrs. R. Wallace and Co. staged liliums, calochorti, and irises in plenty, and made a pretty display. Mr. Foster, Brockhampton Nurseries, Havant, sent a large collection of fragrant and bright sweet peas; and Messrs. A. W. Young and Co., Stevenage, showed gloxinias, a miniature rockery, filled with alpine and other small hardy plants in flower, and backed by dwarf and rare conifers. Mr. A. Perry, of Winchmore Hill, sent a grand lot of hardy flowers, his forms of Inula glandulosa being especially noteworthy. A handsome group of well grown pot roses, backed by tall bamboos and standards of the useful Hydrangea paniculata, was an effective exhibit contributed by Messrs. J. Veitch and Sons, Chelsea. Japanese maples, and also a group of stove plants, were well set up by Messrs. Fromow and Sons, Chiswick.

Messrs. T. Rivers and Sons, Sawbridgeworth, made many mouths water with their wonderfully fine peaches, nectarines, 1897 and 1898 apples, cherries, etc. The new Thomas Rivers peach was a great attraction. A most gorgeous exhibit of cannas came from Messrs. H. Cannell and Sons, Swanley, and was probably the finest this firm has ever shown; every plant was a perfect specimen with a grand spike, and each grown in a 48 sized pot. Hardy flowers were contributed by Messrs. J. Jackman and Son; Woking; roses by Mr. Spooner, Woking. Carnations were admirably shown both by Messrs. J. Peed and Son, Norwood, and Messrs. W. Cutbush and Son, Highgate, the latter sending Malmaison varieties.

Mr. H. Howard, gardener to H. Little, Esq., Twickenham, put up a beautiful lot of orchids not for competition; fine examples of odontoglossum, citrosmum, cattleya gigas, C. Mendeli, C. Mossiæ, Lælia grandis tenebrosa, Cymbidium Lowianum, and cypripediums in variety; this was a splendid amateur non-competitive display.

SHIRLEY GARDENERS' ASSOCIATION.

AT the monthy meeting of this society, held at the Parish Room, Shirley Southampton, there was a fair attendance, the President, Mr. F. G. Spranger, presiding. The lecture, "Some Asiatic Plants Noticed During Travels in Japan, China, and Ceylon," was given by Mr. W. Frank Perkins, M.R.A.C., and being most profusely illustrated by lantern views, gave an admirable idea of the gigantic proportions attained by tropical vegetation. His remarks on the tea and coffee plantations of Ceylon were especially interesting, and also his description of the methods of cultivation adopted there in reference to these crops. Much attention was also given to the palms, bananas, and spice trees, views of all being thrown on the screen with many other plants. At the close of the lecture a very hearty vote of thanks was accorded to Mr. Perkins, and gracefully acknowledged.

There was a good display of roses from Mr. W. H. Rogers, Mr. W. Knapp, Mr. J. Hallett, and Mr. G. Verdon. Mr. W. Knapp gained a certificate for twelve plants of caladiums, and Mr. B. Ladhams, F.R.H.S., one for a new seedling white pink, and he also showed a good lot of hardy herbaceous cut blooms. Mr. E. J. Wilcox prints of tropical plants.

COMING EVENTS.

BITTON AND OLDLAND HORTICULTURAL ASSOCIATION, August 20
CHELMSFORD CHRYSANTHEMUM SHOW, November 16 and 17.
HARTLEPOOL CHRYSANTHEMUM SHOW, November 15 and 16.
KENILWORTH HORTICULTURAL SOCIETY, July 14.
LOUGHBOROUGH HORTICULTURAL SOCIETY, July 20.
ROMSEY AND DISTRICT HORTICULTURAL SOCIETY, August 1.
THE DITTONS HORTICULTURAL SOCIETY, July 13.
WOKING CHRYSANTHEMUM SHOW, November 2 and 3.

New Plants, Flowers, and Fruit.

Stanhopea Rodigasianum.

A wonderful orchid with a huge flower that measures eight inches across and hangs at the end of a very long peduncle; the upper sepal is concave, creamy white, tinged with green on the inside and heavily spotted with crimson on the back; the lower sepals are of a similar colour, but on the inner surface have towards the centre an aggregation of large and intense blackish crimson spots of considerable size. The petals stand out straight, and are wholly of a creamy colour. The lip is large, and has a dark crimson base and whitish centre; the large wings and apical tip are shining and creamy, the whole of their surfaces being freely dotted with crimson. The column has a long curved base streaked with crimson, the apex being spotted with crimson on a rosy ground. The column curves over and almost meets the upturned lip. F.C.C., R.H.S., June 28. Mr. W. H. White, grower to Sir Trevor Lawrence, Bart., Burford Lodge, Dorking.

Cattleya Adela.

This is a handsome hybrid cattleya with soft purplish sepals and petals and a fine lip that has a purple apex and orange-stained throat. The bloom measures about six inches across, and the margins of the petals are so reflexed as to touch each other behind. The lip has a frilled margin and is very broad, crimson-purple, shaded with rose-purple; there are streakings of orange or gold at the throat; this is the result of crossing C. Percivaliana with C. Trianæ. A.M., R.H.S., June 28. Messrs. J. Veitch and Sons, Chelsea.

Lælio-cattleya Canhamiana var Joyce Wigan.

A beautiful variety, with handsome broad sepals and petals, that are of a soft lilac colour, tinged with rosy-purple at the margins. The lip is very large, the elongated tube being white at the base, but otherwise of a rich purple hue, tinged with crimson at the mouth of the broad labellum; the base of the throat is lined with dark gold. The margin of the lip is waved and crisped very prettily. A.M., R.H.S., June 28. Mr. W. H. Young, orchid grower to Sir F. Wigan, Clare Lawn, East Sheen.

Cypripedium I'Ansoni.

A splendid new hybrid cypripedium, with very large flowers that have long drooping petals, palest green, with numerous claret-purple spots; the margins are also slightly hairy; the sepals are aboul equal, pale shining rose, with curved lines of intense blackish-purple, the lines being composed of contiguous spots, and half the lines longer than the others. Lip very full, deep reddish-rose, with pale rose base. A fine and attractive hybrid, obtained by crossing C. Morganiæ with C. Rothschildeanum. It is named after Mr. I'Anson, orchid foreman to Messrs. H. Low and Co. F.C.C., R.H.S., June 28. Messrs. Hugh Low and Co., Bush Hill Park, Enfield.

Nasturtium Queen of Tom Thumbs.

A pretty dwarf form, compact in habit, and having rich crimson-scarlet flowers. The leading difference in this and other forms of the Tom Thumb nasturtium is having the small leaves heavily splashed and variegated with creamy white and whitish green. A.M., R.H.S., June 28. Messrs. Watkins and Simpson, Neal Street, Long Acre, W.C.

Gaillardia W. B Childs.

A handsome and bold gaillardia, with large flowers that have very broad, deep yellow ray florets, that are tinged with scarlet at the base. A fine and useful garden plant. A.M., R.H.S., June 28. Messrs. Kelway and Son, Langport.

Digitalis purpurea grandiflora.

This is a marvellously fine form of the popular foxglove, producing huge spikes of large, full flowers, varying in colour in different plants, and mostly having very pretty spots in the throat. This is rather a strain of foxgloves than any one particular plant. A.M., R.H.S., June 28. Messrs. J. Veitch and Sons, Chelsea.

Begonias.

Florence Nightingale is a fine double white tuberous begonia, broad in petal, and very substantial.

Thunderer, a beautiful soft scarlet tuberous begonia, very double, of large size, with the outer petals much notched, and the inner ones less so. A.M., R.H.S.. June 28. Mr. B. R. Davis, Yeovil, Somerset.

Malmaison Carnations.

Mrs. de Satge, a huge flower of a rich but soft rosy-scarlet hue; very fragrant.

Lord Welby, very handsome, and with broad segments; soft rosy-scarlet, more rosy than Mrs. de Satge.

Margot, a pretty and broad-petalled form of a deep red hue.

Baldwin has flowers of immense size, and of a most pleasing and deep pink shade. A.M., R.H.S., to each, June 28. Mr. C. Blick, gardener to Martin R. Smith, Esq., The Hayes, Kent.

Campanula mirabilis.

A distinct campanula, with rounded or somewhat cordate leaves that are rigid and deep shining green. The flower stem is blanched from quite at the base, and bears large broadly campanulate flowers of a very pale blue tint, almost white at the base, inside; the five lobes at the mouth of the corolla have a deeper shade of blue on either side of the central whitish band. A hardy perennial that flowers throughout the summer. F.C.C., R.H.S., June 28. Messrs. G. Jackman and Son, Woking.

Roses.

Rev. Allan Cheales.—This is a charming h.p. rose, very full and double; the colour is deep rose shaded with carmine. The petals are very broad and rounded, turning back prettily at the margin. The flowers are but slightly scented. A full-page illustration of this fine rose was given in the Gardeners' Magazine, July 8, 1897.

Una is a distinct and new rose obtained by crossing Rosa canina with a garden variety of R. indica It has a climbing or rambling habit, with neat shining foliage, and an abundance of semi-double flowers of a soft creamy colour, deeper in the centre and lighter at the apices of the segments. The fragrance is exactly that of the wild dog rose. A fine garden rose. A.M., R.H.S., to each, June 28 Messrs. Paul and Son, Cheshunt.

Iris juncea numidica.

A pretty iris of slender and elegant growth, bearing graceful flowers of a very rich golden yellow; the standards are small and droop slightly; the falls are very fine, and the base is feathered with scarlet veins. A.M., R.H.S. June 28. Messrs. R. Wallace and Co., Colchester.

Lupinus polyphyllus.

A very pretty lupin, not over tall and with a bushy habit, bearing long full spikes of flowers that are of a pretty soft yellow shade. This should prove a fine hardy plant if amenable to general cultivation. A.M., R.H.S., June 28. Messr Kelway and Son, Langport, Somerset.

Philadelphus Lemoinei.

An exceedingly graceful hybrid form of the ever-popular "Syringa." It has flowers smaller than those of P. coronaria, and leaves of less size also; the growths are slender but covered with tiny branchlets of soft creamy-white flowers that are extremely beautiful. A.M., R.H.S., June 28. Messrs. Barr and Sons, Covent Garden and Long Ditton.

Peach Thomas Rivers.

This is one of the largest of peaches, quite a new variety, and one that is likely to prove useful for late supplies. The fruits are of the largest size and of a pretty peach-fawn hue on the shaded side, with rich but soft scarlet shading and streakings on the sunny side. When started with Early Rivers and Cardinal nectarines it does not ripen until four to six weeks later. It is stated to be also a good coolhouse peach. F.C.C., R.H.S., June 28. Messrs. T. Rivers and Son, Sawbridgeworth, Herts.

Rose Show Fixtures in 1898.

July 2 (Saturday).—Crystal Palace (N.R.S.).
,, 5 (Tuesday).—Diss, Harrow, and Hereford.
,, 6 (Wednesday).—Chelmsford, Ealing, Farningham, †Hanley, Hitchin, Redhill (Reigate), and Tunbridge Wells.

August 4 (Thursday).—Bedale.

* Shows lasting three days. † Shows lasting two days.

Rosebank, Berkhamsted, Herts. Edward Mawley.

The West Patent Pottery and Machine Company (Limited) has been formed to acquire the existing patents in pottery manufacture invented by Mr. West, of Roundhay, Leeds, and for their development for practical purposes. According to the prospectus the patents to be secured were issued between 1889 and 1896, and the terms of their acquisition include all British rights, together with the land, occupying an area of some eight acres, situated at Higham Hill, Walthamstow, with sundry erections and kilns thereupon, together with a limited number of machines at present in operation. The purchase comprises the rights to manufacture and supply the machinery for working such patents and all improvements therein for the production of flower-pots, telegraphic insulators, plumbago crucibles, electrical and medical jars, and domestic ware made of plastic materials, as well as the granting of licences upon royalties and the promotion of subsidiary companies. Upon a recent visit to Walthamstow the process of manufacture was exhibited. The material used in production is first formed by a mechanical contrivance into a lump of desired size, and this is then placed in the moulding machine, when a plunger presses the clay into a mould of the required shape, and subsequently two or three revolutions of the trimming wheel suffice to remove superfluous material from the edges, and a pressure from a piercing appliance simultaneously applied, gives the perforation in the bottom of the pot. Thus it is claimed that the time occupied in producing pots by this process effects a considerable saving by comparison with the old method, while the shape is improved, and with regard to porosity, it is stated that the utensils made by these machines are sufficiently porous. The capital of the company is £100,000, of which the vendors take £55,000 in shares, and £25,000 in cash, leaving a working capital available of £20,000. The amount in shares already disposed of thus leaves only £45,000 actually available for public subscription.

Coming of Age Festivities at Stourbridge.—The coming of age of Mr. E. Stanley Webb, eldest son of Mr. Edward Webb, was celebrated on Saturday, the 25th ult., Mr. and Mrs. Webb having invited the staff of Messrs. Webb and Sons to their beautiful residence at Studley Court, Stourbridge. There were about four hundred present, including the staff from Wordsley and the hands employed at the Kinver Seed Farms, also the managers from the chemical works at Chester. Fine weather prevailed and the visitors were enabled to spend a very pleasant time. A variety of games was provided for their amusement, whilst many availed themselves of boating on the lake, a fine sheet of water four acres in extent. The house and grounds were both open, and in the early part of the proceedings, afternoon tea was served, after which the whole party was photographed on the terrace. The band of the 2nd Battalion Bedfordshire Regiment gave great pleasure by their performances. Dinner was served in a large marquee, after which Mr. W. W. Wyld, on behalf of the staff, presented Mr. Stanley Webb with an illuminated address, together with several handsome articles, including a travelling-bag, dressing-case, hunting-crop, sandwich case, &c. Mr. Wyld testified to Mr. Stanley Webb's popularity with the staff. Mr. Stanley Webb, in responding, said he could not sufficiently thank them for the kindly feeling towards him as expressed in the address, and he also acknowledged his indebtedness to them for the assistance they had given them since his connection with the business. "Success to the Firm" was proposed by Mr. J. W. Berrington, who referred to the great abilities and untiring energies of the firm—Colonel Webb and Mr. Edward Webb. They always kept the business abreast with the times. Every year saw some new development, either the extension of the warehouses at Wordsley, the acquisition and enlargement of the works at Chester, or, as it had been during the past year, the purchase of an additional estate adjoining their seed farms at Kinver; and also the erection of more plant houses at Wordsley for the growth of certain flowers and other special experiments. Colonel Webb, in replying, said, great as the business was, wonderful as the growth had been, he confidently looked forward to even greater progress in the future. Mr. T. R. Marshall proposed the health of Mr. and Mrs. Edward Webb, who were so highly esteemed in the district no less for their liberality to public institutions than for their unassuming benefactions in private life. Mr. Edward Webb responded. He said the event was one of the greatest in his life, and he hoped his son would uphold the traditions of the firm, and maintain the high position it occupied.

ANSWERS TO CORRESPONDENTS

Editorial communications should be addressed to the Editor of the GARDENERS' MAGAZINE, 148 and 149, Aldersgate Street, E.C.

The Editor will be glad to receive photographs of gardens, plants, flowers, trees, fruits, &c., for reproduction in the GARDENERS' MAGAZINE. He will also be greatly obliged by correspondents sending early intimation of interesting local events relating to horticulture. In sending newspapers containing matter to which they wish to draw attention, correspondents are requested to distinctly mark the paragraph.

Specimens of plants, flowers, and fruits for naming or opinion should be sent to the Editor of the GARDENERS' MAGAZINE, "Endsleigh," Priory Park, Kew, Surrey, and as early in the week as possible. All parcels must be sufficiently prepaid.

Cockscombs, Celosias, and Love-lies-bleeding.—A. T. J., Harrow: You are wrong in stating that cockscombs, celosias, and love-lies-bleeding all belong to the same genera. They all belong to the same natural order, viz., Amaranthaceæ. The cockscomb is Celosia cristata, and from this species the garden forms now so popular in many establishments have been developed. The plants commonly known in gardens as celosias are cultivated forms of Celosia pyramidalis. Love-lies-bleeding is Amaranthus caudatus, and the closely allied Prince's Feather is A. hypochondriacus.

Scalding of Madresfield Court Grapes.—J. C., Glastonbury: The berries sent are not affected with any disease in the general acceptance of that term, but have suffered very severely from scalding. The remedy is better ventilation. Sometimes a certain vine in a house is year by year the only one upon which grapes are scalded, and this being so, careful observation should be made, and it will be probably found that ventilation does not properly affect this vine, while the sun has considerable influence upon it. Bad glass is sometimes answerable for scalding, but insufficient or improper ventilation, sometimes caused by the construction of the ventilators, is the general cause. Scalding is due to the action of strong sunlight upon berries that are more or less covered with condensed moisture.

Loss of Branches on Pear and Apple Trees.—E. G., Deal: In the absence of any particulars as to soil, subsoil, age of trees, &c., we cannot say with certainty what is the cause of shoots and branches of both pears and apples succumbing as in the case of the specimens sent. It is highly probable that canker has set in as a result of the roots having recently entered a cold, heavy subsoil, and had their growing points killed. If the decay was less general than your letter suggests, it is, we should be inclined to consider, due to the ravages of some borer at a point lower down the branch than the shoots sent. Carefully examine the trees, and if no trace of boring can be found then canker is the cause. The remedy can be provided by bringing the roots nearer the surface, both by surface feeding now and lifting in the autumn.

Forsythias.—J. F., Cardiff: These pretty yellow-flowered shrubs are easily propagated either by layering or by cuttings. The latter should be taken about August, and inserted in light soil; they will root freely if placed under a hand-light in a pit or greenhouse, or even in a cold frame if kept close for awhile. The two commonly cultivated species are F. suspensa and F. viridissima, both early flowering, and producing yellow flowers along their graceful growths. F. suspensa has fewer flowers than F. viridissima, but these are of a rich canary yellow colour, and rather fuller than in the latter species. F. viridissima was introduced by the celebrated traveller and collector, Mr. Fortune, who sent it to Chiswick in 1845. It was at first treated as a greenhouse plant, but as soon as stock was obtained experiments were made, with the result that the species was found to be quite hardy. There is a hybrid between the two species alluded to, and it is named F. intermedia; it has the habit of F. viridissima, but the flowers more closely resemble those of F. suspensa. All three are useful plants for spring flowering, are easily cultivated, and may be grown in pots, forced slightly, and used for conservatory decoration.

Arpophyllum giganteum.—P. S. T., Sutton-on-Hull: This is a by no means commonly grown orchid, but it is nevertheless a very useful one, especially where there are large orchid houses. There are some half-dozen species of Arpophyllum, all natives of Mexico and Central America, but A. gigantea is the boldest of them all. Even when not flowering it is a handsome plant by reason of its somewhat drooping, dark green, ensiform leaves, one of which surmounts each growth. The flower spikes are usually produced during April and May; they rise from the top of the growth, are from eight inches to a foot long, bearing a large number of small but beautiful blossoms of a dark purple and rose colour. In a cool house the flowers last in perfection for about three weeks. Being a Mexican plant, it requires rather warmer treatment than is generally accorded the cool odontoglossums; the intermediate house will suit it if a position at coolest but light end is given it. Failing such a house, place the plant in the warmest corner of the cool house. The plants require potting much in the same way as cattleyas, but with rather more compost, though a large amount of drainage material must be provided. A liberal supply of water is needed during the growing season, but considerably less during the period of rest, though anything approaching the condition known as "drying off" must be avoided. This orchid loves an abundance of light, and like many other Mexican orchids, needs shade only during the brightest part of a hot day.

Names of Plants.—Under this heading we can only undertake to name species and specific varieties of plants, and not florists' flowers. Specimens should be packed in stout boxes with damp moss or leaves as packing material to ensure their reaching us in a fresh state. It is essential that flowers must accompany specimens of flowering plants, that fern fronds be fertile, and that the numbers be legible and firmly attached to the specimens. We cannot promise to name more than six specimens at one time from any one correspondent.

R. F. J., Anglesey: Anthericum Liliago, Anthericum Liliastrum has a larger flower.

G. A. R., Lincoln: 1, Nicotiana affinis minor; 2, Maurandya Barclayana.

C. F., Hereford: 1, Rosa rugosa; 2, Piptanthus nepalensis; 3, a leaf of Polygonum Chaillueana; 4, Odontoglossum Cervantesi.

P. J. G., Oxford: 1, Franco aramosa; 2, Lilium umbellatum.

OBITUARY.

PROFESSOR ANTON KERNER, RITTER VON MARILAUN, the eminent [illegible] died, we regret to record, a few days since at Vienna, in his [illegible] Professor Kerner was educated for a doctor, and served for [illegible] medical staff of the General Hospital at Vienna, but he soon [illegible] study of medicine for botany, in which he achieved so much fame. He wrote a considerable number of works on botanical subjects, but that by which [illegible] known in this country is his "Natural History of Plants," of which an [illegible] English edition was published by Messrs. Blackie and Son a few years [illegible] In 1872 Professor Kerner was made a member of the Vienna Academy [illegible] Sciences, andfour years later on received the honour of Knighthood.

MARKETS.

Covent Garden.

BOTH fruit and vegetables are now plentiful, and the supplies are good. The [illegible] is brisk, and prices moderate. New potatos, peas, strawberries, cherries, and [illegible] berries have cheapened considerably.

FRUIT.—Tasmanian apples, 10s. to 20s. per case; strawberries, 4s. to 12s. [illegible] dozen punnets, 2s. to 3s. 6d. per gallon basket; cherries, 3s. 6d. to 7s. 6d. per [illegible] sieve; English grapes, 1s. 6d. to 2s. 6d.; Jersey, 1s. to 1s. 6d. per lb.; goose[illegible] 1s. 6d. to 2s. per half-sieve; lemons, 8s. to 16s. per case; bananas, 5s. to 9[illegible] bunch; pineapples, 2s. to 4s. 6d. each; green figs, 2s. to 4s.; peaches, 3s. to [illegible] dozen; melons, 1s. to 2s. each.

FLOWERS.—Arums, 3s. to 4s.; carnations, 1s. to 3s.; eucharis, 3s. [illegible] gardenias, 1s. to 3s.; Lilium Harrisi, 3s. to 4s.; tea roses, 6d. to 1s.; [illegible] 2s. to 4s.; red roses, 1s. to 2s.; cattleyas, 6s. to 9s.; Odontoglossum crispum, [illegible] to 4s.; and tuberoses, 1s. to 1s. 6d. per dozen blooms; Adiantum cuneatum, 4s. to 8s.; marguerites, 2s. to 4s.; mignonette, 2s. to 4s.; pelargoniums (scarlet), 4s. to 6s.; stephanotis, 2s. to 3s.; lily of the valley, 6d. to 1s.; white gladiolus, 6d. to 9d.; and pelargoniums, 4d. to 6d. per dozen sprays; bouvardias, 6d. to 8d. per bunch.

WEST'S PATENT
IVORINE PLANT LABELS

THE "IVORINE" WRITING DISC, being made of a Celluloid and Xylonite composition, is imperishable, and does not corrode or eat away, like wood and metal labels; and being ivory-white, when written upon it shows to perfection. And also, as the writing is on the Ivorine itself it is permanent, though washable, and does not become unreadable like all other labels, for hitherto all labels have been painted, as the paint gets old. It is for labelling every description of goods when used with or without the wires, and will last a century, either in a greenhouse, in a wine cellar, or out in a garden, and not only is it always ready for use, and may be written on both sides, but the name when written in pencil may be easily rubbed off, and so used as many times as desired.

Samples and Lists of the West's Patent Specialities post free. Price, **9d.** per dozen; **8s.** per gross, complete; **7s.** per gross without wires, Carriage Paid. Size a little larger than illustration, and wires 2 ins. longer from loop. (See List for other sizes). Special ink, if required, in **6d.** bottles, per post.

Supplied by all Nurserymen, Florists, &c.

THE AMATEUR'S GREENHOUSE and CONSERVATORY.

—*Illustrated with Engravings and Coloured Frontispiece.*—By SHIRLEY HIBBERD. A Complete Guide to the Construction, Heating, and Management of Greenhouses and Conservatories, and the Selection, Propagation, Cultivation, and Improvement of Ornamental Greenhouse and Conservatory Plants.

"This book is well adapted for amateurs. It points out, in its earlier chapters, the main considerations which affect the construction and heating of conservatories and greenhouses. In the fourth chapter the amateur is initiated in potting, composts, propagation, etc. Then follows a series of chapters in which the treatment of the different groups and families is explained, Greenhouse Herbaceous Plants leading the way, followed by the Chrysanthemum, to which a chapter is given; Soft-wooded Plants; Pelargoniums; Fuschias; Hard-wooded Plants; Ericas and Epacrises, Camellias, Azaleas, and Rhododendrons; Climbers; Oranges, etc. Hard-leaved Plants, as Agaves, Dracœnas, etc. Succulent-leaved Plants; Orchids and Pitcher Plants; Greenhouse Roses, etc. One chapter is devoted to a general selection of Greenhouse Plants; another to Summer Cucumbers and Seedling Pelargoniums; while others afford reminders of monthly work. The volume is nicely printed and elegantly bound; and, so far as we have had the opportunity of testing it, seems to be sound as to its practical recommendations."—*Gardeners' Chronicle.*

Fcap. 4to., cloth, bevelled boards, lettered in gold and colours. Price 5/-
By SHIRLEY HIBBERD.

THE IVY.—A Monograph.

—*Illustrated with Coloured Plate and Wood Engravings. Small quarto, handsomely bound, cloth, gilt.* Comprising the History, Uses, Characteristics, and Affinities of the Plant, and a Descriptive List of all the Garden Ivies in Cultivation.

The York City and County Banking Company (Limited), and Lloyds Bank as their London Agents, are authorised to receive Subscriptions for the undermentioned Shares.

WEST'S PATENT POTTERY AND MACHINERY COMPANY (LIMITED),

Incorporated under the Companies' Acts, 1862 to 1893.

SHARE CAPITAL £100,000, divided into 100,000 Ordinary Shares of £1 each, of which 20,000 will be reserved for Working Capital; the Vendors taking £25,000 in Cash and 55,000 Shares. ISSUE of 45,000 SHARES, payable 2s. 6d. on Application, 2s. 6d. on Allotment, and the Balance by instalments of 2s. 6d. as and when required in periods of not less than two months.

DIRECTORS.

J. C. JERRARD, Ravenshoe, Denmark Hill, S.E.
S. C. PLATTS, F.C.A., 7, East Parade, Leeds, and Scarborough.
H. HAYDN YORK, Waldegrave, East Grinstead.
*H. LOWRY L. BERESFORD, 8, Arundell Street, Piccadilly, London, W.
*JOHN RICHARDSON, Shaw House, Headingley, Leeds (Director of Harding, Richardson Rhodes, and Co., Limited).

* Will Join the Board after Allotment.

BANKERS.

YORK CITY AND COUNTY BANKING COMPANY (Limited), Leeds; their Branches and their London Agents.
LLOYD'S BANK (Limited), 72, Lombard Street, London, E.C., and their Branches.

BROKERS—S. G. SHEAD, 36, Throgmorton Street, and Stock Exchange, London, E.C.
SOLICITORS—Messrs. WEBB, NICHOLS, and ALLINSON, 11, Argyll Street, W.
AUDITORS—Messrs. DAVIES, TAIT, and Co., Chartered Accountants, 46, Queen Victoria Street, E.C., and at Glasgow.
SECRETARY and OFFICES (pro tem.)—G. KING MEARES, 31 and 32, Gray's Inn Chambers, High Holborn, W.C.

PROSPECTUS.

OBJECTS OF THE COMPANY.

This Company has been formed to acquire the Patents, hereinafter referred to, and the Land, Plant, Machinery, to work such Patents and all improvements thereto, to build machines, to manufacture and deal in Flower Pots, Telegraph Insulators, Plumbago Crucibles, Jam Pots, Electric Battery Jars, Medical Jars, Basins, and all kinds of domestic ware made of any plastic material, glass, &c., to grant licenses on royalty, or to let on hire or on royalty, or to sell outright, the patent machines, and to form or promote subsidiary companies, and for the other objects set out in the Memorandum of Association.

The inventions (the British rights for which have been secured by the Company) are not simply improvemements on the machines now in use in the trade, but to introduce a machine built on entirely new and distinct principles, and the great improvement in the quality of the work produced, and the much lower cost, combined with the rapidity of production, will, it is confidently believed, completely revolutionize the important trade in articles such as those above mentioned.

The Patents are as follows:—

United Kingdom,	No. 16,264,	dated	Oct. 16th, 1889,	granted to W. West.
,,	6,704	,,	May 1st, 1890,	ditto
,,	7,406	,,	May 13th, 1890,	ditto
,,	23,640	,,	Dec. 22nd, 1892,	ditto
,,	10,471	,,	May 15th, 1896,	ditto

Messrs. Abel and Imray, the Patent Agents, have made a search as to any prior British Patents affecting the Patents already granted, and their report has been laid before Mr. Bousfield, Q.C., M.P., whose opinion is given below.

FIRST REPORT.

Mr. John Imray, of the firm of Messrs. Abel and Imray, after an inspection of the machine in work, has reported thereon as follows:—

WEST'S PATENTS

Are directed to the manufacture of Clay or earthenware articles such as flower pots, saucers, or, indeed, anything that can be moulded by pressure between a mould and core.

The machinery described in some of these patents, with certain improvements to which a subsequent patent application, No. 23,640 of 1892 relates, operates in a most satisfactory manner. I HAVE WATCHED THE MOULDING MACHINE TURNING OUT 16 FLOWER POTS PER MINUTE, MUCH MORE TRUE AND SOUND, AND FAR STRONGER THAN THE HAND-MADE POTS, OF WHICH NOT MORE THAN 1 PER MINUTE COULD BE MADE. Each pot as it is moulded is in condition for being taken direct to the kiln, without requiring to be dried for several weeks, as is the case with hand-made pots. This results from the fact that the clay employed in the West Moulding Machine is very little moistened, and that in the act of moulding it is subjected to very great pressure between a steam heated mould and a steam-heated core.

By this treatment another great advantage is secured—total absence of air-bubbles in the moulded article, and consequent freedom from that which, in the case of hand-moulded pots, causes the breakage of 25 to 30 per cent. in baking.

The machine-made pots being all true to shape, as determined by mould and core, can be packed together for transport without risk of the fractures that occur when hand-made pots are packed together. However carefully the potter may form a pot by hand from wet clay, the drying and baking are sure to cause irregularities of shape, which, when one pot is inserted in another, often act with the power of wedges to crack the outer pot. When, on the other hand, the pot is moulded under great pressure from clay which is almost dry, and which is thus consolidated, its form remains quite regular after baking, and it is so strong that even if irregularity did occur, there is little or no liability to breakage when such pots are packed together.

(Signed) JOHN IMRAY,
Jan. 23rd, 1893. Memb. Inst. C. E., and Memb. Inst. Min. E.

OPINION—RE WEST PATENTS.

OPINION.

I have carefully perused the Specifications 6,704 of 1890, 7,406 of 1890, 23,640 of 1892, in conjunction with the prior Specification 16,264 of 1889.

It appears to me that these three Specifications are in conformity with the respective Provisional Specification, and that the claims afford good subject matter upon the face of them, and sufficiently distinguish that which is intended to be claimed.

As regards the sufficiency of the Specification from a practical point of view, I think they should be submitted to an expert, who should report whether they are sufficient to enable a competent workman to manufacture the apparatus described.

Assuming that this report is favourable and assuming that the subject matter of all the claims is new and useful, I see no reason to doubt the validity of these Patents.

16th March, 1896. (Signed) W. R. BOUSFIELD, Q.C., M.P., Inner Temple.

SECOND REPORT.

28, Southampton Buildings, Chancery Lane, London, W.C., 20th March, 1896.

I am ready to express my opinion as an Engineer that the Specifications referred to in Mr. Bousfield's opinion are sufficient to enable a competent workman to manufacture the apparatus described.

I can also say that as far as I know the inventions claimed were new at the dates of the respective patents and that I believe them to be useful.

Yours faithfully, (Signed) JOHN IMRAY.

FINAL REPORT.

Since writing my Reports dated respectively January 23rd, 1893, and March 20th, 1896, I have examined the United States Patent which corresponds with West's Patent No. 23,640 of 1892, also the German Patent No. [illegible], which corresponds with West's British Patent No. 6,704 of 1890. As these Patents were not granted until after the usual strict investigation as to novelty little doubt can be entertained that the inventions covered by those Patents were new at that date. IT IS REMARKABLE THAT IN THE INVESTIGATION AS TO NOVELTY CARRIED ON BY THE UNITED STATES PATENT OFFICE, NOT A SINGLE ANTICIPATION WAS FOUND. I have had a search made among all British specifications lodged since March, 1893, when the above-mentioned U.S. patent was applied for, in order to ascertain whether West's Patent No. 10,471 of 1896 has been anticipated. No anticipation has been found. As the specifications Nos. 6,704/90, 23,640/92, and 10,471/96 are sufficient, AND THE INVENTIONS CLAIMED ARE USEFUL AS WELL AS NOVEL, I CONSIDER THESE PATENTS VALID.

(Signed) JOHN IMRAY,
[illegible] Chambers, Southampton Buildings, London, W.C.

ADVANTAGES.

From the above reports it will be gathered that the chief advantages claimed for machines constructed under the above Patents are:—

1. The [illegible] rapidity of production as compared with the old hand process, coupled with truer shape and stronger make.

2. The great saving in drying space, the article moulded being practically in a condition to be taken direct to the kiln, without requiring to be dried for several weeks.

3. A saving of breakages in burning, of at least 25 per cent. over hand-made articles owing to the absence of air bubbles, which exist in the latter.

4. The saving of fuel, in consequence of the dryness of the articles to be burnt.

5. The saving of breakage in transit, owing to the machine-made articles being true to shape, and being thus capable of being packed together for transport without risk of fracture.

6. It is estimated that there will be a large saving in the cost of production, viz.:—From 4d. to 6d. per cast over the hand method.

ASSETS OF THE COMPANY.

The property and assets to be acquired by the Company are:—

1st. The Patents above mentioned.

2nd. The freehold estate of about eight acres, at Higham Hill, Walthamstow (underlying which there is practically an inexhaustible bed of suitable clay, tested to over fifty feet from surface), together with the plant, machinery, kilns, and drying sheds.

3rd. The royalties to be obtained from the hirers of the presses.

The machines are working at the Company's works at Walthamstow, and at their licencees, Messrs. Turner's (Limited), Portobello, N.B.

THE TRADE IN GREAT BRITAIN.

The annual trade in Great Britain in flower pots alone is believed to be at least 500,000,000, or 12,500,000 casts (taking the average of 40 pots to the cast), valued at £625,000, of which about £156,000 represents profit.

Each set of presses can (at an average cost of 6d. per cast) turn out 108 casts of flower pots per day, which, even if sold only at 10d. per cast (the present cost of manufacture by hand), would still show a handsome profit.

PROFITS.

It is proposed to increase the presses working at Walthamstow to 12 sets, which, working at half their capacity and selling at the present London price of 1/3 per cast, would make a profit per annum	£6,561
Minimum Royalties and Rentals on Contracts already entered into. (It is estimated that these royalties will amount to over £2,000 per annum)	£650
Estimated Profit from Rental and Royalties on 50 sets of presses working at half their capacity	£9,112
Net Profit	£16,323

DIVIDEND.

This amount of profit (£16,323 as estimated above) does not include the profit that will be derived from the manufacture of the other articles which the machines are capable of turning out, but will be more than sufficient to pay a dividend of over 12½ per cent. on the total capital, and allow nearly £1,000 a year for reserve and administration expenses.

PURCHASE PRICE.

The purchase price for the patent rights for the United Kingdom, together with the freehold land, plant, machinery, kilns, &c., at Walthamstow, has been fixed by the vendors, Messrs. Ellisson and Co. (who are the promoters, and who are selling at a profit) at £80,000, payable as to £25,000 in cash and £55,000 in shares, leaving the balance for working capital, which is considered more than ample.

The Vendors pay all expenses of whatsoever kind, up to and including the first general allotment of shares, excepting Registration fees.

Mr. H. L. Beresford and Mr. John Richardson, being interested in the profits arising from the sale, will join the board after allotment.

CONTRACT, &c.

The following contract has been entered into:—An Agreement, dated 25th day of April, 1898, made between West's Patents Syndicate, Limited, of the one part, and Messrs. Ellisson and Co. of the other part.

Contracts have also been entered into by the Vendors in connexion with the acquisition of the Patents and during the formation of the Company, including arrangements relating to the subscriptions of a portion of the capital, and some or all of these may technically be contracts within the meaning of Section 38 of the Companies Act of 1867, but the Company is not a party to any of them and applicants for shares will be deemed to have waived all rights to be supplied with particulars thereof whether under the above mentioned section or otherwise, and allotments will only be made on this express condition.

Application for shares should be made on the form accompanying the Prospectus, and sent to the Company's Bankers, their Branches or Agents, with the amount payable on application.

If no allotment is made, the deposit will be returned in full, and where the number of shares allotted is less than the number applied for, the balance will be applied towards the instalment due on allotment.

Copies of the Memorandum and Articles of Association and the Contract above mentioned; the report of Mr. John Imray, of Messrs. Abel and Imray, and the case for and the opinion of Mr. Bousfield, Q.C., M.P., can be inspected at the office of the Company's Solicitors.

Prospectuses and forms of application for Shares can be obtained at the offices of the Company, or from its Brokers, Solicitors, Bankers, and their Agents.

London, June 27th, 1898.

THIS FORM MAY BE USED.

WEST'S PATENT POTTERY AND MACHINE COMPANY (Limited).

SHARE CAPITAL £100,000,

DIVIDED INTO 100,000 SHARES OF £1 EACH.

Payable 2s. 6d. on Application, 2s. 6d. on Allotment, and the Balance by instalments of 2s. 6d. as and when required in periods of not less than two months.

To the DIRECTORS of the WEST PATENT POTTERY and MACHINE COMPANY (Limited).

Gentlemen,—I request you to allot me ....Shares of £1 each in the above-named Company, and I agree to accept the same, or any smaller number that may be allotted to me, subject to the Memorandum and Articles of Association, and upon the terms of the Prospectus issued by you, dated the....................day of .... 1898, and I authorize you to place my name upon the Register of Members in respect of Shares so allotted to me; and I agree to pay the further instalments upon such allotted Shares as the same shall become due; and I agree with the Company, as Trustee for the Directors and other persons liable, to waive any claims I may have against them for not more fully complying in the said Prospectus with the requirements of Sec. 38 of the Companies' Act, 1867.

I enclose a Cheque for.............being the deposit of 2s. 6d. per share payable on application.

FERNS!—In 2½ in. pots, 25 sorts, 12s. 100; in 48's, 10 best selling, 6s. doz.; seedlings, 6s. 100; Grevilleas, Cyperus, Aralias, Geraniums, Selaginella, and Rhodanthe in 48's, 6s. doz.; Marguerites, Heliotropes, Tropæolums, 8s.; Spiræas, and Fuchsias in 48's, in bloom, 8s. doz.; Ficus, Palms, Dracænas, Pelargoniums, Asparagus, Hydrangeas, and Ericas in bloom, 48's, 12s. doz.; A. cuneatum, 48's, value in fronds, 6s. and 8s. doz.; for potting on, bushy, 16s. and 20s. 100. Packed free. Cash. Trade prices. List free.—J. SMITH, London Fern Nurseries, Loughborough Junction, London, S.W.

ASPARAGUS FALCATUS syn. Sprengeri.—Good plants, in 60-pots, 6s. per dozen; stronger, 9s. per dozen; a few dozen extra sized specimens at 5s. each.
ASPARAGUS DECUMBENS.—Dormant tubers, will bloom in November, 6s. per dozen; young plants from seed-boxes, 5s. per 100; seeds, fresh gathered, 2s. 6d. per 100.
ASPARAGUS COMORENSIS.—Strong plants, 6s. and 9s. doz.
POINSETTIA PULCHERRIMA.—Strong, in 60's, 3s. per doz.; 20s. per 100. All packing free for cash with order.
T. JANNOCH, Lily Nursery, Dersingham, Norfolk.

ORCHIDS! ORCHIDS!! 10,000 must go.—This being the end of the importing season, I must clear off my surplus Stock, regardless of cost. I have, therefore, decided to make the following unprecedented offer: 6 assorted Orchids for 6s.; 12, 10s.; 25, 20s.; 50, 35s.; 100, [illegible]. Every plant guaranteed sound and true to name.
J. W. MOORE, Orchid Importer. Rawdon, near Leeds.

SPLENDID COLLECTION of FUCHSIAS to include Mr. Gladstone, M. Carnot, Royal Purple, and many other new sorts. I will send 40 distinct grand varieties; good strong plants, worth more than twice the money, 4s. 6d., Free, also will send 30 distinct zonals, 15 of each double and single Magnificent, None More, two to three years old. Good plants, 5s. Free. Send for List.—JOHN BORE, Barrow Hill, Chesterfield.

CLEARANCE SALE.—100,000 BEGONIA TUBERS. Large, erect flowering. Singles, 12, 2s.; 25, 3s. 6d.; 50, 6s.; 100, 11s. Doubles same price. Smaller, 12, 1s. 6d.; 25, 2s. 6d.; 100, [illegible], for cash.—JOHN WELLS, Begonia Nursery, Ryarsh, Malling, Kent.

S. A. VAN KONIJNENBURG and Co., Bulb Growers, NOORDWIJK (HOLLAND). Largest Cultivators of Hyacinths, Tulips, Crocus, Daffodils, Liliums, Gladiolus, &c., &c. Catalogue free on application. Adding 5 per cent. to Invoice's Amount, or paying cash, we send Bulbs carriage paid.

GISHURST COMPOUND.— Used since 1859, for Red Spider, Mildew, Thrips, Green Fly, and other Blight, 2 ounces to the gallon of soft water, 4 to 16 ounces as a Winter Dressing for Vines and Orchard House Trees, in lather from cake for American Blight, and as an emulsion when paraffin is used, has outlived many preparations intended to supersede it. Boxes 1s., 3s., and 10s. 6d.

GISHURSTINE keeps Boots dry and soft, Boxes 6d. and 1s. from the trade. Wholesale from PRICE'S PATENT CANDLE COMPANY (LIMITED), London.

THE PATENT SILICATE MANURE.—A Speciality for Cropping Vines, Tomatos, and Peaches, and for Hardening the Wood and Colouring the Fruit. Used for years by the leading Growers. 12s. 6d. per cwt., carriage paid. Write for pamphlet of particulars.

EXCELSIOR FERTILIZER.—A Silicated Horticultural Manure, the result of years' experience, containing Ammonia 6—7½%; Phosphates, 24—25%; Sul.-Potash, 6½—7½%. Full directions for use, and guaranteed analysis with every bag. ½ cwt., 12s. 6d.; 1 cwt., 21s., carr. pd.—THE PATENT SILICATE MANURE CO., LTD., Hemel Hempstead, Herts. Estab. 1888.

ORCHIDS of every description from 1s. each. Rare plants at low prices. Every plant sent on approbation. Correspondence invited. New Catalogue free.—The LEEDS ORCHID Co., Roundhay, Leeds.

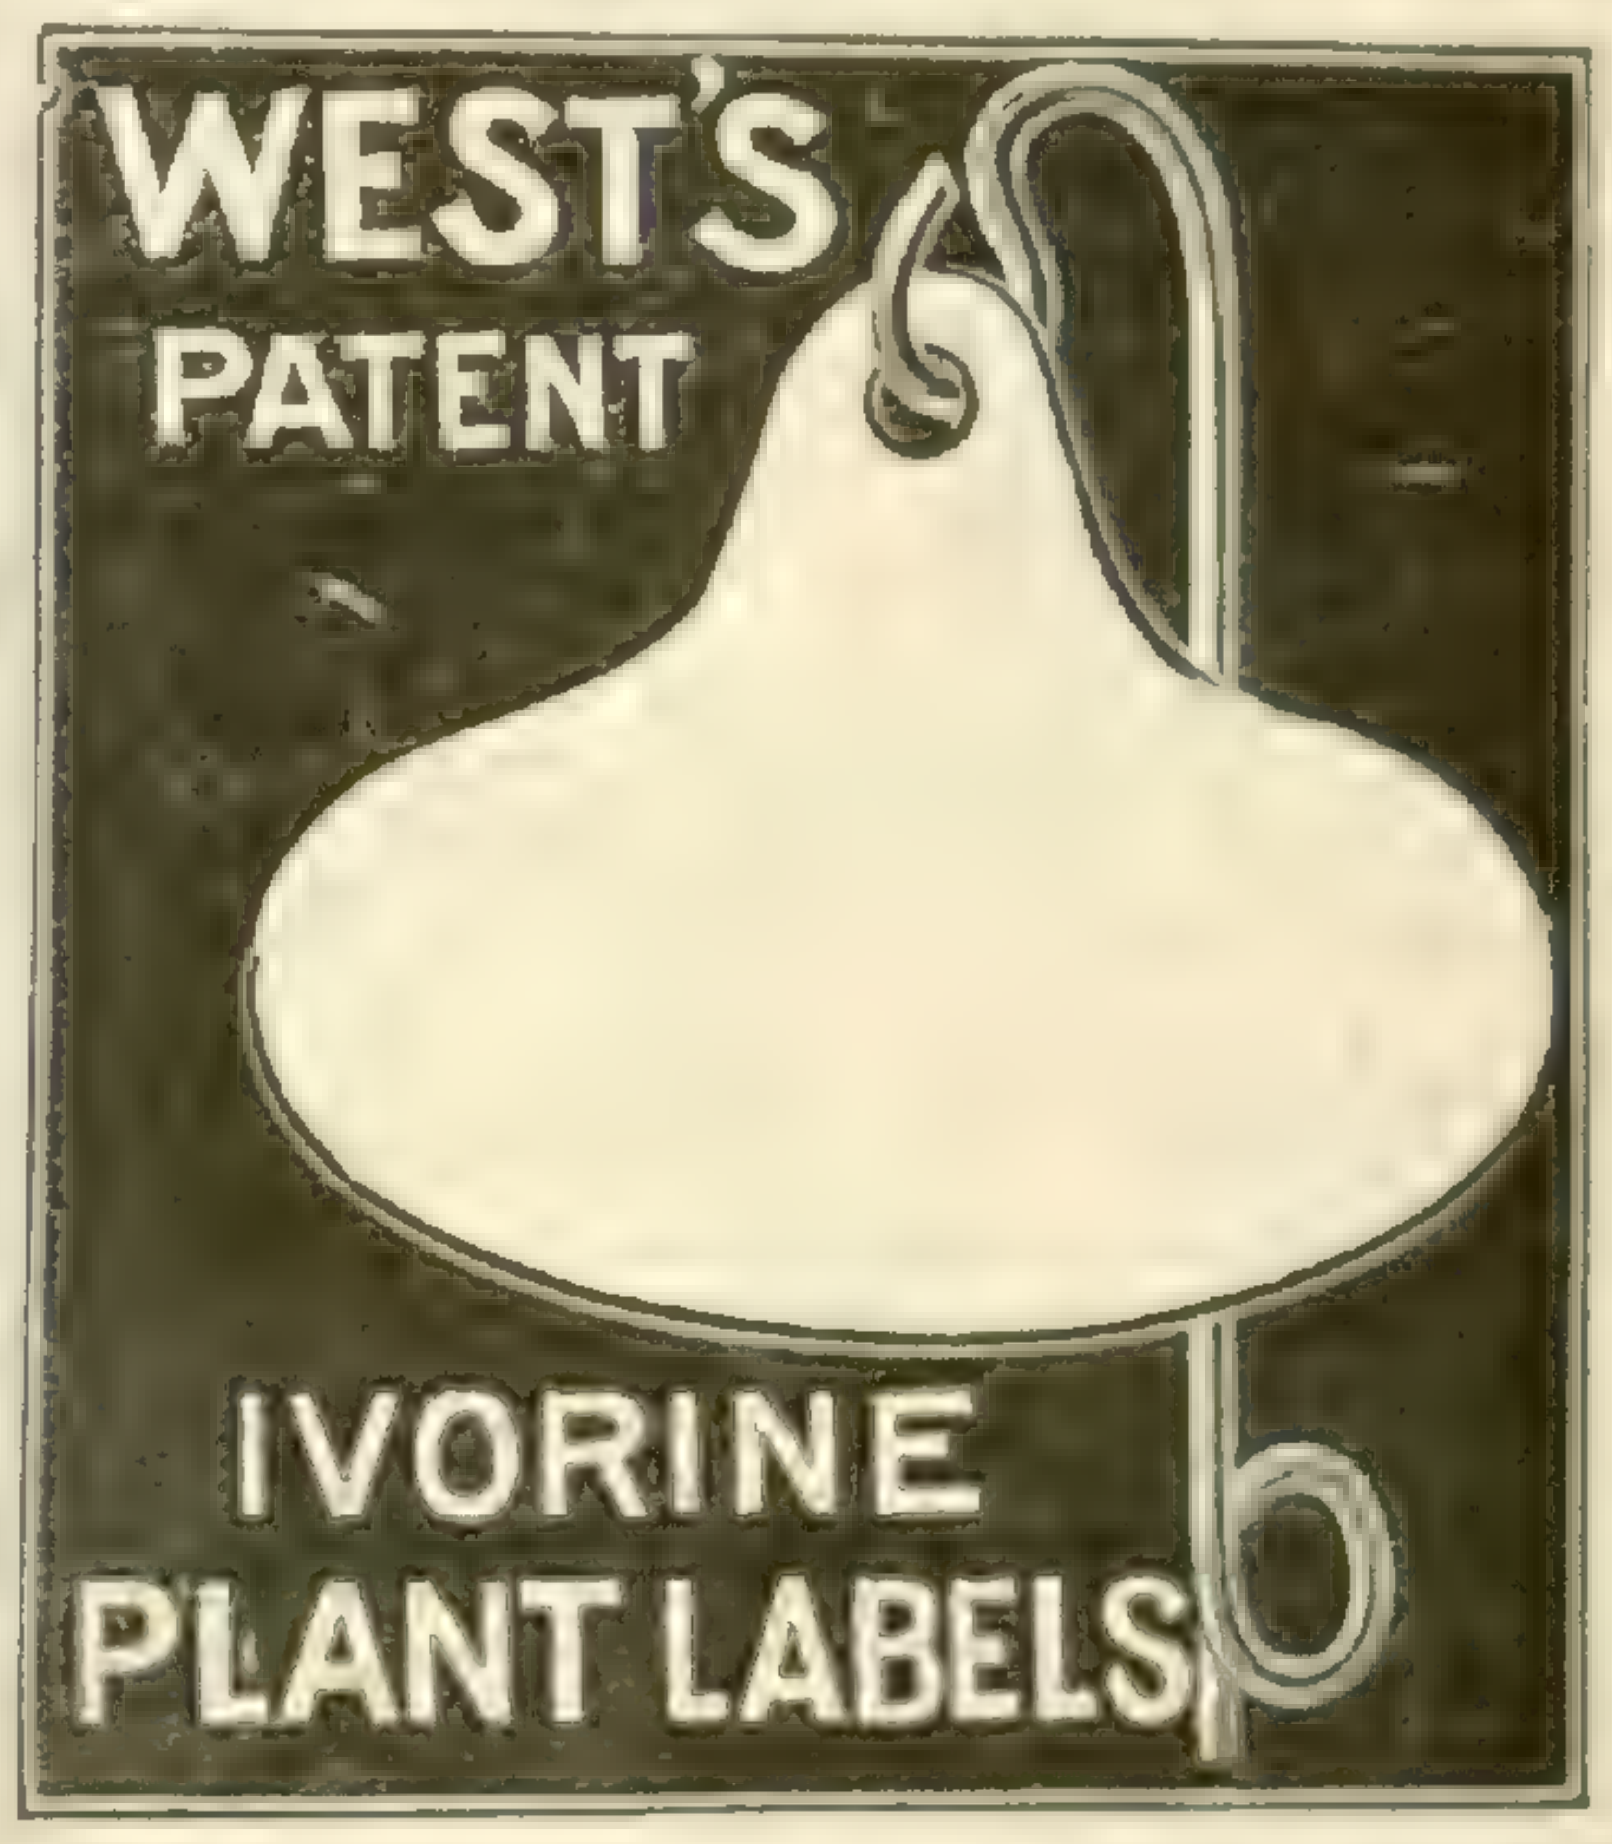
R. HALLIDAY and CO.,
ROYAL HORTICULTURAL WORKS,
MIDDLETON, MANCHESTER.



THE "IVORINE" WRITING DISC, being made of a Celluloid and Xylonite composition, is [illegible], and does not corrode or rot away, like wood and metal labels; and being ivory-white, when written upon it shows to perfection, and also, as the writing is on the Ivorine itself it is permanent, though washable, and does not become unreadable like all other labels, for hitherto all labels have been painted, as the paint gets old. It is for labelling every description of goods when used with or without the wires, and will last a century, either in a greenhouse, in a wine cellar, or out in a garden, and not only is it always ready for use, and may be written on both sides, but the name when written in pencil may be easily rubbed off, and so used as many times as desired.

Samples and Lists of the West's Patent Specialities post free. Price, **9d.** per dozen; **8s.** per gross, complete; **7s.** per gross without wires, Carriage Paid. Size a little larger than illustration, and wires 2 ins. longer from loop. (See List for other sizes). Special ink, if required, in **6d.** bottles, per post.

Supplied by all Nurserymen, Florists, &c.

NOTES OF THE WEEK.

NATIONAL ROSE SOCIETY'S EXHIBITION.

IN few years has the metropolitan exhibition of the National Rose Society been anticipated with a greater degree of interest than was that held at the Crystal Palace on the 2nd inst., for not until the eve of the show was it possible to forecast with any degree of accuracy whether it would be successful or otherwise. Notwithstanding the easterly winds, the late spring frosts, and the plague of aphis with which roses had to contend previous to the season of flowering, they made a vigorous growth and produced buds that gave the promise of large and otherwise well developed blooms. But owing to the low temperature, more especially at night, that prevailed during the greater part of June, the larger proportion of the buds on reaching a somewhat advanced stage came to a standstill and hardened, instead of unfolding their petals to delight the cultivator with their beauty. The process of development was, indeed, so slow that a week in advance of the date of exhibition not even the most experienced rosarian could be induced to give a definite opinion as to its prospects. They were in full accord with the opinion to which we gave expression in our last issue, which was to the effect that, with a continuance of the cold weather experienced at the beginning of the week, the show would be below the average both in the numbers and the quality of the flowers; and that with a few days of warm weather the display would be a good one. Happily, there was a few days previous a change for the better in the climatic conditions, and, in consequence, we have to record one of the best metropolitan gatherings the society has held. It was by no means a record, but there was a sufficiently keen competition to tax to the utmost the judgment of the thirty or forty judges engaged in making the awards, and the quality of the competing collections was very good. On the whole, the trade collections were much superior to those from amateurs, which is all the more remarkable from the fact that the garden plants which in most seasons give the professionals so great an advantage were not sufficiently advanced to give any considerable number of blooms, and the cutbacks had to be almost wholly depended upon for the supplies. Two of the three important challenge trophies found a new home for the next twelve months, and with reference to the transfer of the tea trophy from East Anglia to Bath, it may be said that the warm terraces which Mr. Hill Gray has constructed at so great an expense stood him in good stead this season, for his collection was undoubtedly at its best. Garden roses were again largely shown, and, arranged in large bouquets, they produced a rich effect, and fully justified the prominent position assigned them in the schedule. Some day, we hope, the garden roses may have two challenge trophies provided for them, one for competition amongst amateurs and the other amongst trade growers, and we have no doubt the society would readily add these trophies to their other awards were it in a position to do so; but the holding of three exhibitions in one season imposes too heavy a strain upon the funds to admit of large sums being expended in the purchase of trophies. These roses are now so well shown under existing conditions, and constitute so charming a feature that we may depend upon the executive which is distinguished for its breadth of view, giving them the fullest possible encouragement. With the whole of the two naves at their command, the honorary secretaries, the Rev. H. H. D'Ombrain and Mr. E. Mawley, arranged the exhibition with due regard to tasteful effect and the convenience of visitors, and obtained as their reward much praise.

FLORAL VARIETY.

IN going the round of one of the public floral displays, such as we get periodically at the Drill Hall at Westminster, and especially such collections as are brought together there at this the most redundant season of the year, the observant mind can scarcely fail to be struck by the manifold and multiform ways in which the simple life history of a plant can manifest itself. That history, briefly told, is the germination of a seed, the production of leaves and flowers, and finally the reproduction of seed by fertilisation, and the subsequent ripening and dissemination prior to beginning the same life cycle anew. This is the history not merely of all flowering plants, but also of all ferns, and even mosses, though in these the flowers are quite microscopic, forming, as compared, say, with the gigantic blossom of the Rafflesia, extreme instances of divergence in size. Some flowers are so constituted that the whole of this process is carried through by the individual without cross-fertilisation by pollen conveyed from the blossoms of another plant, and it is beyond a doubt that were this the case throughout the vegetable kingdom, we should either have no flower shows at all, or have to be contented with an exceedingly poor display, since, wonderful to relate, just as the affections elevate mankind by emulation, so has the need of one flower for the aid of another, and the resulting necessity of attracting the messengers of love by conspicuous form and colour elevated our flowers from the level of insignificant weeds to the sovereign dignities of rose and tulip, and all their charming companions in Flora's fair domain. In these later days, of course, man himself has stepped in as Cupid's envoy in many cases, and thus brought about combinations and results which bee or moth, or the thousand and one other insects which do this duty normally, could never have effected. For these the flower may fashion and provision its nectary, paint itself with gorgeous tints, contrive cunning traps and lines, and in so doing split genera into species, and widen the range of normal beauty which existed long before man took part in the operations; but for our finest blooms, as a rule, much more must be done, and a very different plan of selection adopted than Nature herself carries on. Hence an immense majority of the blooms we behold on the occasions cited are the elaborated outcome of man's peculiar tastes, and are, indeed, often unnatural, in the sense that the original simple end and aim of the plant and flower, viz., reproduction, is arrived at with greater and greater difficulty as the flowers approach man's ideal of perfection. The vigour which should produce the seed is diverted into other channels, or it may be that the potencies of mixed parentage become so complicately intermixed that the plant is quite incapable of reproducing itself, even when seed is yielded, the outcome of the struggle within it for pre-eminence among the varied influences being more or less reversion to ancestral types, though now and again they crown the cultivator with success by contriving some brilliant combination on unexpected lines. Nevertheless, though, as we have said, the majority of the flowers exhibited owe their beauty largely to man's selection, the occult influences of Nature herself, working, typically speaking, through bee and bloom alone, have fashioned some of the very fairest flowers extant. Our stateliest lilies, to wit, owe but little to man's aid, and though of late most marvellous orchids have been raised and blended with great success as regards the production of new varieties, it is to the lover of the orchids at home in their tropical bowers, and the instincts of the insect world which attend upon them there, that the loveliest forms and tints are due, as well as the immense diversity in character and colour.

Our Coloured Plate.—The extremely beautiful rose, Queen Mab, so admirably depicted in the coloured plate presented with this issue, is an important addition to the China section, and of much value for the garden and the supply of cut flowers. Queen Mab is one of the many fine roses raised by Messrs. W. Paul and Son, of Waltham Cross, and, having regard to its freedom and continuity of flowering, the exquisite hues of the blooms, and the distinct colouring of the foliage, we have no doubt as to the variety becoming highly popular and being considered one of the most valuable of the roses that have originated in the Waltham Cross Nurseries.

Despoiling the Country.—We are much gratified to find that the views to which expression has been so frequently given in the GARDENERS' MAGAZINE with regard to the necessity of protecting ferns and some other of our wild plants from the vandals are meeting with support in the pages of the general Press. A contemporary, in referring to the question, observes: "Much has been done by legislation for the protection of wild birds, and it looks as if the day may come when it will be necessary to do the same for wild flowers, especially for ferns. The fondness for ferns grows apace. Those in towns and cities pent are year by year, in ever-increasing numbers, making or renewing acquaintance with rural scenes and the charms of wood and water. A glimpse of the delicate fronds of a fern, just peering forth above withered leaves and grass, excites a desire to take the whole plant home. It is taken up so unskilfully that it is carried back to the town only to wither and die. Every season thousands of ferns are thus taken (only to be sacrificed) from the wooded banks of the Blyth, Wansbeck, and Couquet. To meet the demand for ferns, some persons carry on a regular traffic in them. Living in the locality, they know the habitats of the different kinds, take them up by the score, establish them in small pots, and whip them off to a neighbouring market. The rarer sorts are in danger of being exterminated. Many districts in Cornwall are in this way being robbed of their finest ferns. It has been suggested that the Parish Councils should at least take measures to save those that grow in the wayside hedgerows. The authorities of the Austrian Tyrol have followed those of Switzerland in making regulations to prevent the Alps being stripped of the edelweiss; County Councils should be empowered to extend protection to certain wild flowers, as they at present do to specified wild birds and their eggs. Only thus will some of Nature's rarest floral beauties be saved from extirpation."

The Fruit Crop.—Writing from Kirkby-in-Furness, Mr. Alfred Darbey observes: "As a subscriber to the GARDENERS' MAGAZINE for twenty years, I have derived much pleasure and assistance, as a fruit grower, from the sound teaching contained in the articles during that time. I am particularly interested in an article from your correspondent A. D., in reference to his note on 'Fruit Blooms and Fruit Prospects,' and as he invites opinions as to the cause of the disparity, may I venture to express my opinions on the chief cause of disparity to which he refers. My opinion is that the cause was the very low temperature during May, accompanied here with the coldest east wind experienced for the past seven years, the foliage on four pyramids of Beurré d'Amanlis pear having been completely blackened. Here we have no plums worth mentioning; pears are worse, for even the Hessel has failed in some places. I find Rivers Fertility very hardy. Apples are producing a moderate crop, some as Lord Grosvenor, Grenadier, Bramley, are set too thickly, but the most disappointing of all is the Ecklinville Seedling. I believe this is the third year the results have been nil, and unfortunately I have forty trees of it. I should like to say more but my letter is too long already. I grow sixty varieties and have tried all the leading sorts within half a mile of the sea shore, and perhaps my experience might have been helpful." We shall be pleased to publish the experience of our esteemed correspondent as it cannot fail to be otherwise than interesting and useful to a large section of our readers.

The Leeds Flower Show, held a few days ago, proved a financial failure, and we much regret to hear that the committee is left with a deficit of about £150. This unlooked for result is unaccountable, as the weather was fine and the display good. On the first day half-a-crown was charged until six p.m., and only £15 was taken up to that hour; later, 2,800 people passed into the show upon payment of one shilling. On the second day there were 3,800 visitors; but on the closing day, although only sixpence was charged after four p.m., only 1,200 passed the turnstiles. The lack of half-a-crown admissions seems to have done more than anything else to bring about so large a deficit. It is proposed to appeal to the influential residents of the city for help.

Failure of Black Currants.—An interesting case of the failure of bushes of the black currant to produce fruit for several years is reported upon in the Highland Society's transactions. It appears that Mr. John Speir, of Newton, Glasgow, called the attention of the society's Scientific Committee to a plantation of bushes which, although apparently healthy, had failed to produce crops for four years. He stated that shortly after flowering the blossoms became sickly and dropped off, although for some years after the bushes were planted they bore well. Mr. Speir suspected some injurious constituent in the soil, though it is not clear why he should have entertained such a suspicion, seeing that the bushes had been fruitful. The Science Committee considered the subject worth investigation, and directed their chemist, Dr. Aitken to analyse the soil. He found that there was a deficiency of lime and potash, but does not consider that this accounts for the failure of the bushes to fruit. He found nothing injurious in the soil, and suggests that an examination of the air might throw light upon the subject. Mr. Speir would, no doubt, have detected the presence of the black currant mite if the bushes had been infested with that pest, but nothing is said about their freedom from it.

Lyons International Horticultural Exhibition.—The programme of the international exhibition to be held in the city of Lyons in September next is now published, and the exhibition has the promise, the president informs us, of being of exceptional importance. It is expected that both exhibitors and visitors will be numerous, and that the city will for the time being be the rendezvous of European horticulturists. Programmes may be obtained on application to M. Antoine Rivoire, President of the Organizing Committee, 16, Rue d'Algerie, Lyons, France.

⁂ In consequence of the great pressure on our space we are compelled to leave over the articles on "Austrian Briars," "Tea-Roses for Market," and "Roses in Decorations."

HOW WE MADE OUR ROSE SHOW SUCCESSFUL.

UNTIL the eve of April 23, 1884, roses in North Lonsdale were virtually unknown, except as roses. As to H.P.'s, teas, &c., they were almost mysteries, except that tea leaves were the proper food for tea roses. Certainly we had a few enthusiasts in our midst, but that tea roses could be grown out of doors in our northern climate, there was but one idea, and that was, it could not be done. Our horticultural meeting that night resolved itself into a Rose Show Committee, and much as it is to be regretted, the flower show has been abandoned for lack of energy. Of the original committee of seventeen only four remain, not that death has been very rife, but perhaps enterprise has shaken the lackadaisical ones out of office.

Our first show was held on July 11, 1884, and the same date was fixed in 1890 and 1894. At our first show a lady handed the doorkeeper a ten shilling piece, and great was our gratitude, as the total receipts amounted to £6 4s. 6d. We commenced with nothing, as the North Lonsdale Rose Society was a daughter society of the local Horticultural Society's, hence we were not allowed to solicit subscriptions, and this was rigidly adhered to, as the same hon. secretary worked both societies, and about this time had some correspondence with the Coniston sage, John Ruskin, whose kindness of thought and finance was highly appreciated, and one regret of the writer is that this great critic has never visited our show, though every proper means has been used to gain his presence. The struggle was great; in fact our initial balance was chiefly composed of prize money returned, and discount deducted for cash payments. Cash payments have greatly helped the popularity of the society, and it has generally been our proud position to be free of all debts within a fortnight of show day.

Our first show was held in a charming new auction room; we had two German roller canaries and a musical box for music, and two large cucumbers as extras. The second show was held in the same room, which was greatly beautified, as the walls were covered with exquisite pictures, value £11,000, which were there on sale, and the owner generously presented a special prize, and refused admittance to two old skinflints who wanted to see the pictures, as an excuse to gain free admittance, though they were retired individuals. Unfortunately on this show day the Sunday school anniversary was held, so that a general exodus from town was the order of affairs, though the few loyal visitors were warmly welcomed, but by a little persuasion the genial vicar, Canon C. W. Bardsley, M.A. (a brother of the Bishop of Carlisle) allowed the procession to be dismissed in the square opposite our rose show, somewhat to the discomfort of a few old maids who had anticipated singing "God Save the Queen," out of a shop window, instead of dutifully and loyally paying their respects to "Our Queen."

One jovial genius with a giggling girl on each arm looked fair quarry at the station on arrival of the train for enterprise, so that the chance to burst upon him the glorious news that a rose show was in their midst was not to be lost, but all the return was a vacant stare and—"Is there?" This mode of advertising was never adopted again; ink and paper, whether writing or printing, has been our main sheet. Again, an alteration had to be made so that no clashing or general exoduses took place on our date. To this end every clergyman in the town was advised of our future dates, and asked to make a note of it, and now we can thankfully say our date is respected. Our third show was held in the same room, but by dint of pen, ink, and paper some two hundred ladies were written to to lend their presence and they turned out in grand numbers.

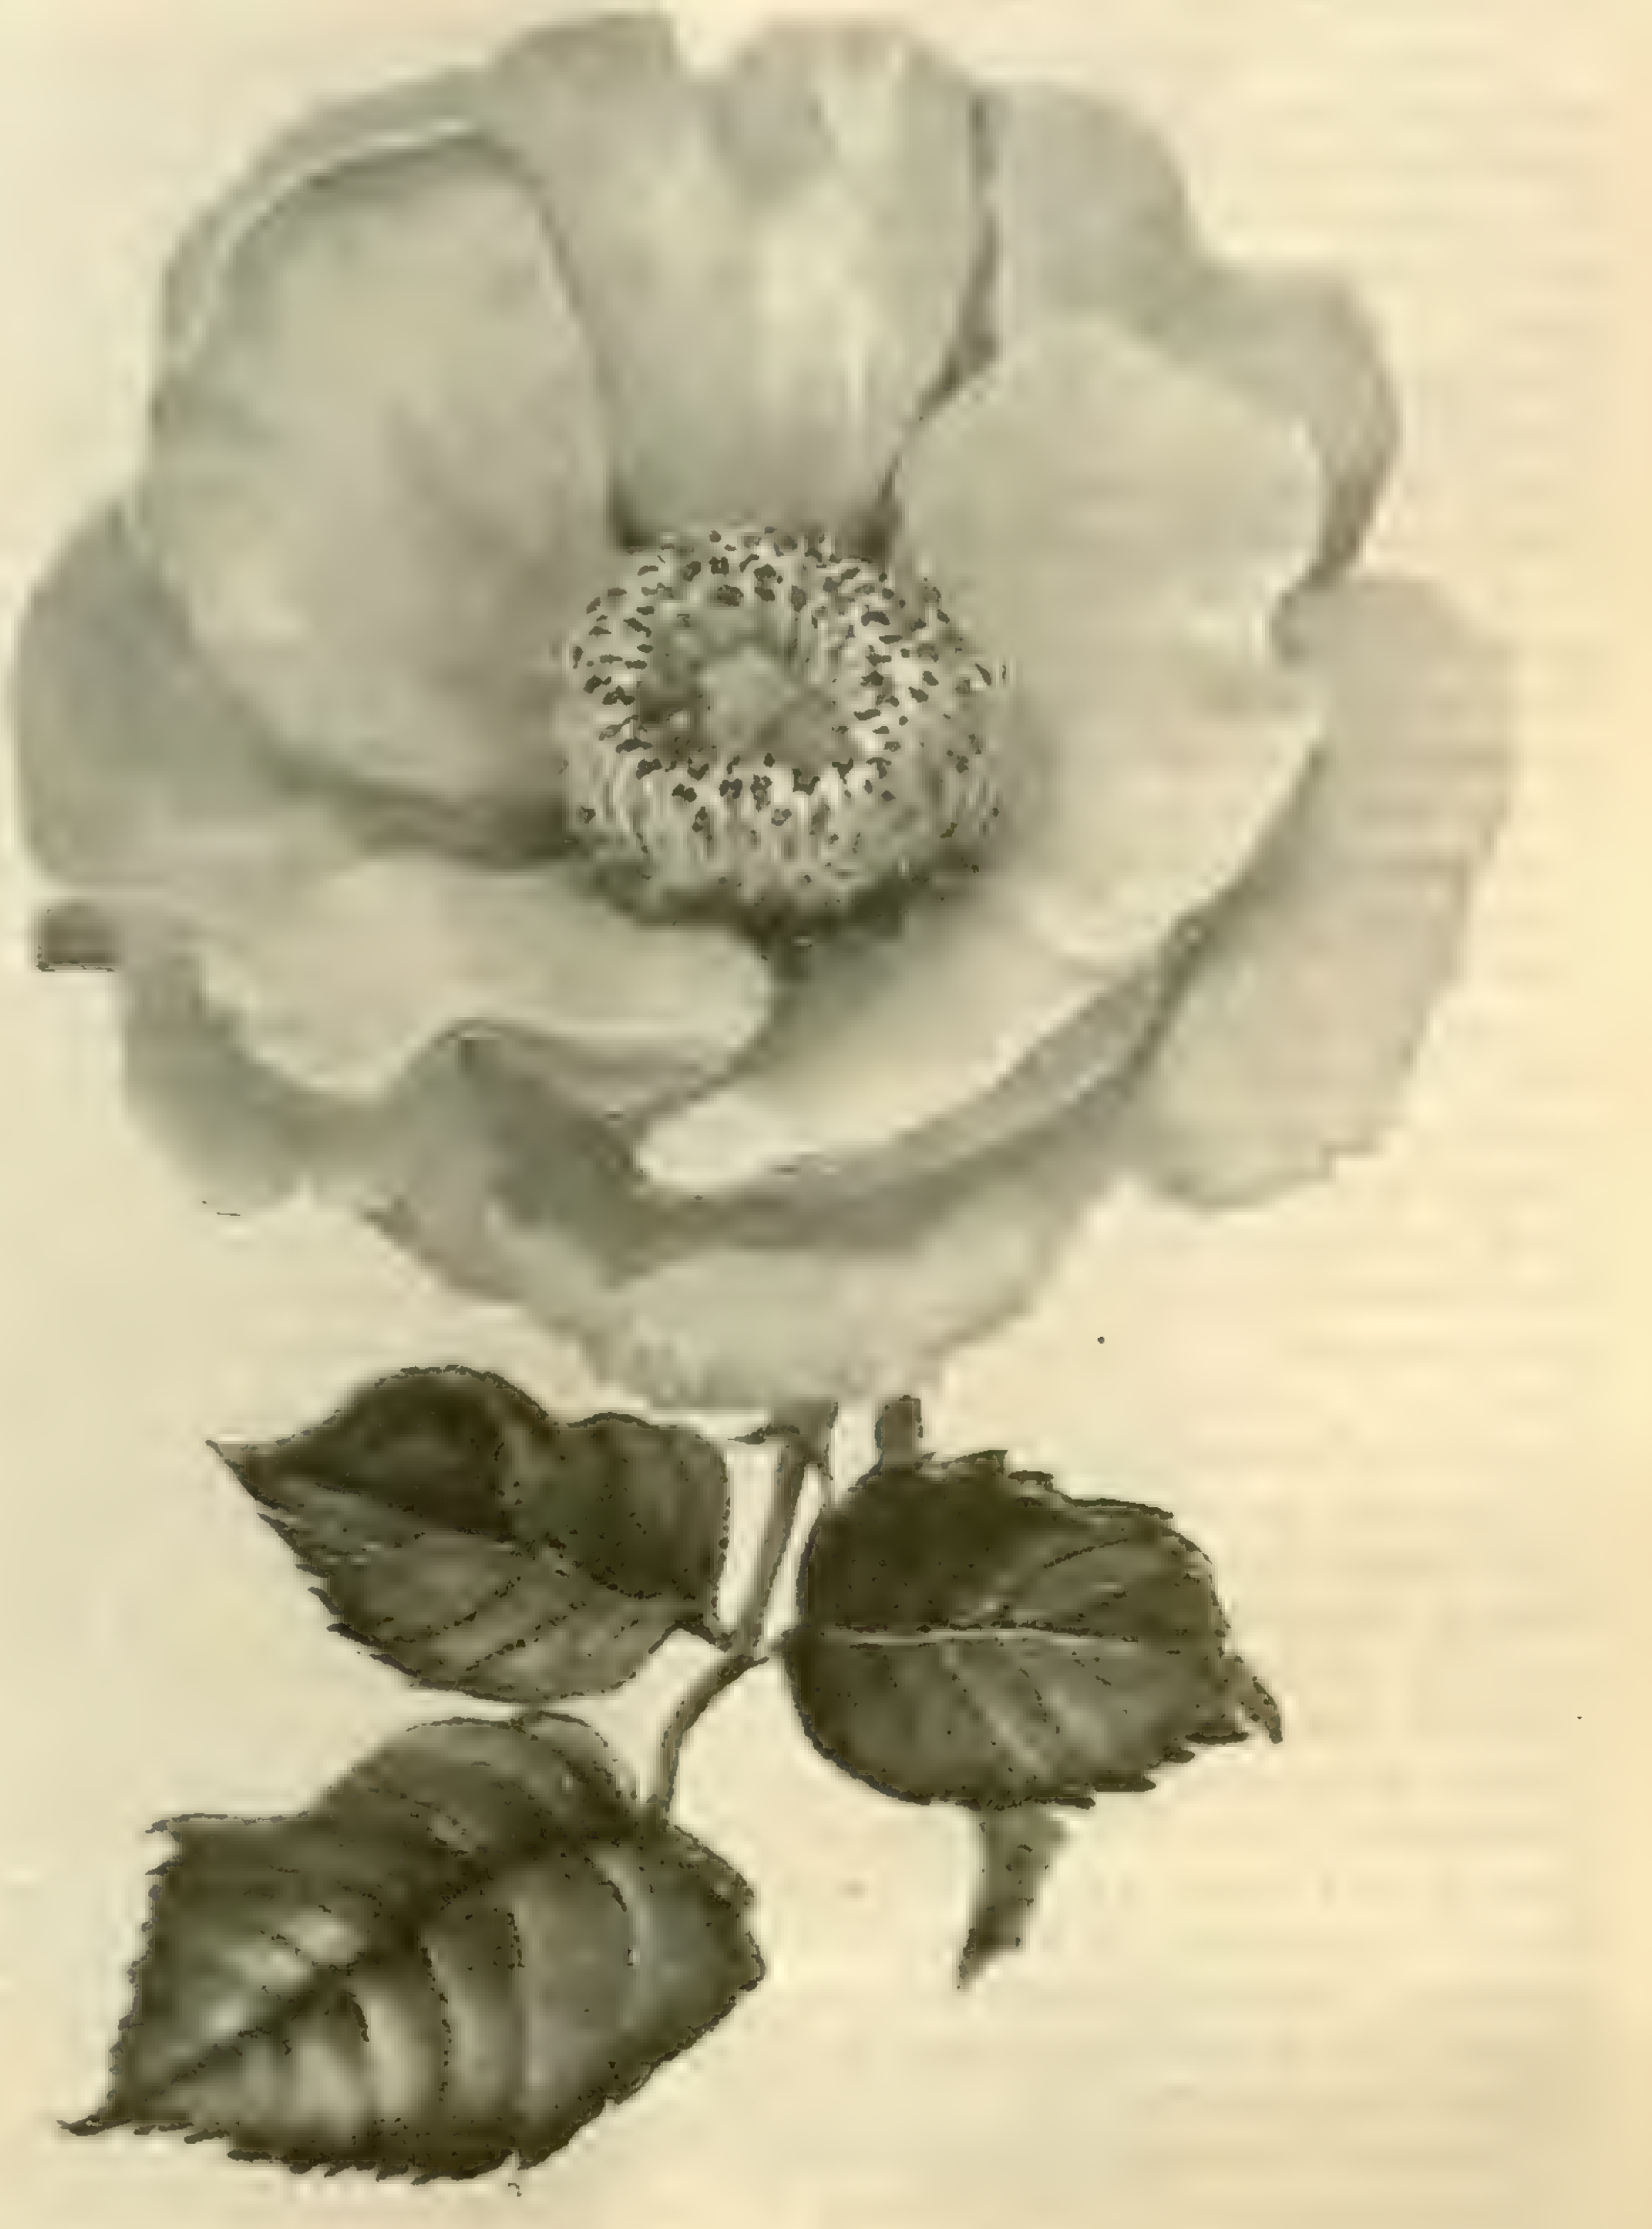
From this date we credited ourselves as being the fashionable gathering of the district, or, as our circulars to-day say, "The Queen of Flowers holds a reception on —— in ——, and *commands* the honour of your patronage and presence." Perhaps not a little of our success was due to the presence of that veteran but enterprising rosarian the late Rev. F. H. Gall, who, be it understood, was duly announced "as coming" in all the papers. We lost no points of this kind, and his reverence was a very Triton amongst the minnows and a regular lady's man. He offered a prize value 16s. 6d., which did the secretary's heart good. Would there were more like this genial soul, but, alas! no longer with us. Of him it is written in our then weekly paper: "It is plucky of an old veteran at rose-showing, the Rev. F. H. Gall, to come some two hundred miles or more to show Ulverston folks how prizes could be won. He must have been a regular teazer, as he carried all before him in the tea rose line"; and amongst our original exhibitors none have forgotten him. It was through him our society became affiliated to the N.R.S., which was one of the best day's work the society ever did. In 1887 we added nurserymen's classes, increasing, as we did, our prize money from £13 to £48 16s. 6d., though we only had a balance of £15 14s. 7d. The show was held in a marquee. Of course, it was Jubilee year No. 1, so we had to break out somewhere. Our railway company were interviewed by our to-day's chairman, and they magnanimously granted us the exceptional privilege of return tickets for single fare over a certain area, which was the first time ever granted. Admitting enthusiasm usually ends in success, getting the right man to be the ambassador is a potent factor in any scheme. Always keep the newspapers fed with the rosiest truths; it greatly helps attendance. This year (1887) T. B. Hall, Esq., Dr. Budd, Rev. F. H. Gall, Messrs. Harkness, Dicksons (Newtownards and Chester) put in an appearance, and we felt our feet, and we knew what roses were. Our local men had a sorry time, and our balance reduced to £3 5s.

Then it dawned upon us that the society could not keep itself going, so that a concert was decided upon. The concert eventually was the entertainment of the season; as a matter of fact in 1892 the concert expenses were £63 11s. 4d., and our balance increased to £41 19s. 2d., which all meant very hard work, with careful expenditure and attention to detail, such as having the genial vicar at the show to greet the visitors, which he did cordially. A judicious circular works wonders, but above all let the printing and paper be of the best. This society has never pandered to the "cheap and nasty" in any detail. Do not be afraid of telling your patrons the truth; they are but flesh like yourself. When in July, 1891, our circular stated: "The Emperor of Germany will not be present, but the under-mentioned are expected: Her Majesty Queen of Queens, Prince Arthur, Duke of Edinburgh, Earl Dufferin, Lady Helen Stewart, General Jacqueminot, and a number of famed beauties in all their glory." We in no wise over-stated the truth. In 1889 Mr. George Dickson, jun., said, you should come to our Newtownards Flower Show in September, and see the "horse jumping." "See the what?" was naturally the first impulse, as it certainly sounded a peculiar combination; but acting on the advice and seeing the success, a mental note was made, but for fear of ruining our local agricultural show, the Rose Show Committee were not asked to run a leaping competition, though entries were promised, as also entries for a ladies' bicycle race were promised if a race were put on the day's programme, and sure enough both would pay handsomely if well worked. As a horticultural society in Ireland (in a small town much the same as Ulverston, with its 11,000 inhabitants, and situated on the sea coast, except that Newtownards has the pull of us by having a large centre like Belfast within a few miles) could have a balance of £500 and some £200 in marquees and fittings, why on earth should not our society make an extraneous effort? Here was the chance. Messrs. A. Dickson and Sons had heaps of seedling roses. Is not the public everlastingly on the outlook for anything new, from a new hat to a photo of the North Pole? Hence, in preparing for our next show a special line of our circular was "Messrs. A. Dickson and Sons will make a unique display of new roses, virtually roses the public has never gazed on," and it was at our show that splendid rose Mrs. W. J. Grant first saw publicity. Such a draw as this was proved to be could not be kept quiet, and when a few of the executive of the N.R.S. proposed to debar exhibits of seedling roses you were kind enough to publish a letter of the writer's at the time. To crown all, when extraordinary efforts had to be made to create a balance, to invite the Northern Provincial National in 1895 to honour us, we had a rose christening, but the original matter on the circular then issued speaks for itself. "The seedling rose christening is indeed a unique and interesting ceremony. Apart from the rose being handed down to posterity, there is the presentation at Court for the medal, the highest honour a rose can gain, hence local interest ought indeed to be keen, and all should witness the Royal Chistening." "Programme of proceedings: At 3.30 p.m. the Rev. J. C. Wright, M.A., will introduce Baroness Halkett, who will present the five medals, after which John Fell, Esq. J.P., will introduce Lady Moyra Beauclerc (Lady Moyra Cavendish), who will select the seedling rose which Mrs. Myles Kennedy, as sponsor, will present to Lady Edward Cavendish to be christened, Myles Woodburne, Esq. (president), and James Hodgson, Esq. (vice-president) returning thanks on behalf of the society."

In 1888 both Mr. B. R. Cant and Mr. F. Cant exhibited, so that there were five nurserymen present, hence our prestige was fully established, and the following years it was our mainstay. In 1891 we had the local volunteer band discoursing sweet music under their correct title, the 1st Vol. Batt. K O. Royal Lancaster Regiment, and they did not belie their name. In 1895 the annual concert was abandoned, as it entailed too much anxiety and labour, and our balance dropped to £1 4s. 4d. The exceptionally hot season, the Royal Wedding (general holiday) on the previous day virtually ruined the receipts, and feeling we were always at the mercy of the weather, a wet day would swamp us in more ways than one, so that a meeting was called to decide on the advisability of winding the society up whilst solvent, on account of lack of funds. Instead of this course being adopted, the society's new president (the late Myles Woodlume, Esq.) proposed the National Rose Society be asked to hold their Northern Provincial Show at Ulverston, which we believe is the furthest north the Provincial has yet been held. Certainly, Mr. Mawley kindly wrote, you cannot afford it; but ways and means were devised, and, as a matter of fact, sufficient money was in the bank to pay off every debt incurred the night before the show. Granted extraneous efforts had to be made, but a guarantee fund was soon formed for £200, and it may be gathered the work entailed when it is known the actual expenditure of this society was £266 5s. 1d. This, of course, does not include the prize money—some £150—given by the N. R. S. The thanks of the society are due to H. V. Machin, Esq., who has so readily and generously helped us. Twenty-four shillings and fourpence was not much of a balance for such an undertaking. Bold or foolish, the visit of the National put this society on its feet, and left it with a balance of £130, although the season of 1896 was one of the worst on record. The Northern Provincial had no doubt the best blooms of the season staged at it. Numerous were the surprises for the exhibitors, who thought they were coming to a colliery district where no one but colliers would be in attendance, whereas Mr. Mawley said it was the best dressed attendance the society had ever been honoured with at a provincial show; and he (Mr. Mawley) and a few others stayed to visit our lovely lake land, our station being the centre for tours for Windermere. There is no scenery in the world to equal our lovely locality, although there may be grander and wilder, but not so charmingly combined as ours, and if it only be to open up to a few the charms of this district our society has not lived in vain, but with our energetic and magnetic new manager, Alfred Aslett, Esq., the Furness Railway may be looked up to as having risen to the occasion. Although native as I am, I never tire of a day trip, notwithstanding that to-day I might have been revelling in Switzerland, and expense free, but give me my native land with an enterprising scenery caterer at my elbow, and a few rose shows annually, and in scenery hunting will not range far.

Excuse the digression, but our scenery is a great adjunct to our success, as the numerous visitors to the district swell our gathering. In 1896 we advertised the chance of a lifetime to see three queens in one day, viz., the Queen of flowers, the Queen of the Lakes, and what the third queen was has slipped memory. For our 1896 (Provincial National) we spent £25 in having a coloured poster, consisting of three roses. The expense was great, but was warranted. We had cheap trips from Sheffield, Leeds, Bradford, Manchester, Liverpool, Carlisle, and Penrith. We engaged the Black Dike Band at great expense, and we had the same band last year, and we offered a gold cup, value £15, for competition. To come up to date, we have a balance of over £100, which we are prepared to sink. If the day (July 8) be wet, we bow to the inevitable. Last year the rain certainly reduced us £20. We have the Kingston Mills Band engaged, and, as a novelty, we have an archery tournament, at which we are giving £20 in prizes. Tickets are sixpence each. We have not a chaplain to pray for us, but do our own praying. Certain it is, we have a grand show, a lovely district, every railway facility. At the National we had seven railway vehicles to meet the exhibitors, which was surprise No. 1, at a quarter-past five a.m., and when they all found themselves at the station again at a quarter-past eight p.m. we were thanked. Yes, there was whiskey and coffee for them too! To run an exhibition successfully means never to lose a point, and virtually always to be hard at it. A man must love his work, as at Derby the writer remembers lugging a four-wheeled barrow to the infirmary grounds, as no other vehicle could be got, and eventually the only man who had a ticket to let any individual in was the hon. secretary from North Lonsdale, but here it was that his mind was set at ease by finding such splendid marquees (Messrs. Banks and Co.'s). The last two years we have had the large 210 feet Derby marquee, which is delivered in Ulverston and rigged up for £15, but have little Hale with it, as, if an exacting secretary wants a flag putting straight on the top of the marquee, he says "Roight, sir; that un," and away he goes like a monkey. Above all things, and could there be a happier conclusion, for an excellent cup of tea and a few nice cakes are provided. Perhaps the most gratifying feature of our show is the lady's committee formed last year to provide tea *à la* bazaar, and they provided such a tea that they have again been prevailed upon to add one more charm to our little fête. Messrs. Alex. Dickson and Sons have promised to make a special display of their new Rose Meta, to the writer's mind one of the most charming teas in existence, with its saffron-yellow suffused with vermilion, its great peculiarity being five distinct coloured blooms have been noted on the same plant. Be it known we sell the flowers at the end of the show by auction, so that we run a few honorary auctioneers.

Ulverston. G. H. Mackereth.



Rose Una.

Hybrid Rose Una.—We give above a characteristic illustration of the new rose raised by Messrs. Paul and Son from the Dog Rose fertilised with the pollen of a tea-scented variety The variety was fully described in our issue of the 2nd inst., and it is not now necessary to do more than state that it was exhibited at the Crystal Palace on Saturday last, and the judges entrusted with making the awards to new roses expressed a wish to see it again.

ROSE GROWING IN TOWN GARDENS.

To anyone who has lived a great part of his life in the pure air and healthy surroundings of a country home, it is a painful experience at first to move his Lares and Penates citywards, and to settle down in the midst of bricks and mortar, and to have to listen to the everlasting traffic in the streets, instead of the song of lark and nightingale; but to no one does the change come home with more powerful effect than to one who has hitherto watched his roses thrive in the untainted country air, and now, instead of seeing them bathed with the pure dews of heaven, has to behold them soot-begrimed and stunted by City fogs, so that he might almost despair of growing roses at all. But the true lover of the rose must have roses, even though they be not grown without infinite care and trouble, and even then cannot touch the standard of those reared in more favoured localities.

And so it came about that the writer has struggled for more than twelve years, more or less successfully, in a suburban garden, "within the eight mile radius from Charing Cross," hemmed in by walls and fences, and trees, to cultivate roses which will give at least fair blooms for four months in the year, and sometimes longer. Of course here the preparation of the soil and much of the after-cultivation are the same as required in other positions, but there are a few little matters of importance to the suburban grower, which tend to give better results if carefully noted and properly followed out.

Firstly, the position of our rose beds should always be in the highest and most central position of the garden, to secure all the light and air possible where the supply of these necessary commodities is so limited. Of course, the fences and walls may be clothed with climbing roses, of which more anon, but the main body of rose trees should stand alone, and away from the shade of overhanging trees, and the scorching and cramping effect of walls and fences. And here we may remark that standards are often to be preferred to dwarfs, as they lift the roses up where more air circulates; certainly the teas and hybrid teas thrive far better as standards, even if the briar stem be but a foot or two in length.

Another point is to get thoroughly healthy trees or bushes from some good nurseryman, and to plant in autumn. November is the best month—of this I am certain—for plants put in during spring often experience a harsh drying wind, and the persistence of north-easterly winds in spring in the neighbourhood of London is most notable, and to this district these notes chiefly refer. By having a supply of dry material at hand, we are enabled to plant at once, even though there may have been some recent rain, and this may be accomplished by getting a few loads of road scrapings, especially during the fall of the leaf, thrown down at our gates and wheeled to some spare corner, where they can be mixed with other material from old hotbeds or seed boxes or frames, and turned over a couple of times before being used. A dressing of bone meal or quarter-inch bones may with benefit be added to top spit when turning it in over the manure, which should have been dug in in the usual way as the beds were trenched. These beds, if made in the grass about five feet wide, allow us to attend to the trees, only placing one foot on the soil, and the roots can ramble at their own sweet will under the grassy paths.

Another great advantage in early planting is that seldom do the rose trees need watering, as do those planted in spring; and to the town grower watering is a heavy item. Most suburban amateurs are away in the City all day, and by the time they return the water has been turned off from the mains, leaving no pressure for a hose to work; and the labour of carrying cans about is so great, that the beds are apt to get a poor supply, which is worse than none. In our gardens, too, which are always in view of the house, mulching is unsightly, to say nothing of the way it is scattered by the birds, which soon find therein a happy hunting-ground. Besides, we cannot use the hoe, and all through the growing season this useful implement will, if not neglected, keep a mulch of fine soil on the surface.

Another point to be attended to is the time for pruning. March is usually given as the time in rose books, but I believe April is quite early enough, finishing off with the teas, and, as a general rule, hard pruning should be practised, except, of course, for those free-growing kinds, whose names and requirements may be learnt from any good catalogue.

In a large collection of roses, grubs and caterpillars may, to a certain extent, be ignored, as they merely thin out some buds; but as our trees are generally very limited in number, we must diligently search for the marauders immediately after growth has begun. I use a narrow spring forceps, which is inserted carefully into a rolled leaf, or between two leaves which are found adhering, and if it is allowed to open gently, you find the enemy lying at your mercy and the point of the forceps. The green-fly, like the poor, is always with us; some years, as the present, in great abundance; and I have found nothing answer better for getting rid of it than to get a solution of quassia chips, mixed in a can with soft soap, and to brush each shoot upwards, holding the other hand against it, with a soft "damping brush," such as is used for copying-books or paste.

It is wonderful how quickly a lot can be done, and if syringed with pure water some hours after, the dead aphides will be cleared away. As these notes are not for exhibitors, there will not be need to recommend severe disbudding, or thinning of shoots, but in any case we should keep the centres of our trees open, and some roses do need "chickening" badly, as for instance, S. M. Rodoconachi. But, after all, the chief point to urge on suburban growers is to select those kinds only which open their blossoms freely, and are least subject to mildew. As examples of sinners in the latter respect, Her Majesty and Madame Moreau may be cited; and for difficulty of opening, especially in damp weather, we may note Jean Ducher and Madame Lacharme.

Before giving a list of varieties which have proved satisfactory in this district, I would suggest that the teas and hybrid teas should predominate in any collection, as they are so much more truly perpetual than the so-called Hybrid Perpetuals. The Hon. Edith Gifford, for instance, has, with me, three successive crops of bloom almost every season. By-the-way, this, with us, almost the best tea, is not universally so free. When looking over the roses lately, of a distinguished amateur grower in the country, who has won no end of trophies and cups for tea roses, he informed me that he cannot grow it satisfactorily. Most lovers of the rose have their special favourite, and if I had to make a definite choice, I should select Viscountess Folkestone. It is free-growing, blooms two or three times each season, is deliciously-scented, and, while charming in the bud, is lovely even when full-blown; hanging on the tree like a big pearly shell. It opens freely, perhaps a little too freely for the exhibitor's taste, though it often figures in prize stands early in the season.

The following list will be found useful to select from. The colours are given in any good catalogue, and each grower can select according to his taste. One great drawback we have in town gardens is that the glorious Maréchal Niel will not do in the open, and as these notes are only intended to refer to outdoor roses, he must be excluded from our list. For general purposes: Viscountess Folkestone, Caroline Testout, La France, Hon. E. Gifford, Anna Olivier, Mrs. J. Laing, Duke of Wellington, A. K. Williams, Dr. Andry, Victor Verdier, Baroness Rothschild, Merville de Lyon, John Hopper, Madame Isaac Pereire, Souvenir de la Malmaison, Suzanne Maria Rodoconachi, Marie Baumann, Ulrich Brunner, Dupuy Jamain, Prince Camille de Rohan, Fisher Holmes, Charles Lefebvre, Madame Hoste, Madame Victor Verdier, Captain Christy, Jeannie Dickson, Margaret Dickson, Mrs. Sharman Crawford, Henri Schultheis, Augustine Guinoisseau, and Gustave Regis. For fences—Gloire de Dijon, Bouquet d'Or, Madame Bérard, Reve d'Or, Amy Vibert, and Flora, as well as the Penzance Briers, though the latter are, perhaps, more suitable for pillars. For small roses, suitable for button-holes, &c.—Laurette Messimy, Perle d'Or, Madame Falcot, Madame Chedane Guinoisseau, Madame Capucine, William Allen Richardson, Allester Stella Gray, and the Austrian Briars. The Japanese roses, Rugosa alba and rubra, have the advantage of doing well almost anywhere, even in partial shade, and have handsome foliage. Lastly, the China roses, pink and crimson, help to brighten odd spots in the garden for several months in the year.

Sydenham. H. SHACKLETON, M.D.

RELATIVE VALUE OF TEA ROSES.

VERY many people who are interested in roses, but who know very little about their culture, are frequently deterred from growing tea roses because of their delicacy. Those who grow only a few plants do not like the risk of losing their whole stock, or a large proportion thereof, by frosts in a severe winter; but with moderate precaution by protection given early in the winter the risk is practically reduced to a minimum, except in the most abnormally severe weather, which rarely comes oftener than once in a decade. In the winter of 1880-1, for instance, and the less severe winter of 1894-5, the loss of tea rose plants was great, but since 1895 the winters have not been severe, and few people have lost many plants. Those who fear to grow tea roses, and therefore have not experienced the advantages to be gained by their autumnal flowering properties, should not delay to try them experimentally, even if it necessitates the elimination of some other varieties. I know many amateurs who are gradually eliminating hybrid perpetuals from their rose gardens and planting teas, because they find that although hybrid perpetuals are usually hardier, and of great value for their floral gifts in early summer, many varieties hardly furnish the house with a rose after July (the delightful rose Gabriel Luizet being a notable sinner in this respect), whereas the tea rose flowers both early and late, beginning in June and giving us good roses up to October.

The exhibitor knows the importance of tea roses from a decorative point of view, as in a box set apart for exhibition they are of great value; but their decorative and staying powers for use in drawing-rooms and about one's house are of far more importance, as they last for many days, and in this respect they rank far before hybrid perpetuals. The scent of many tea roses may not in most cases be equal to the sweetest of the hybrid perpetuals (the most delightful and best known in this material advantage being Maréchal Niel, Madame de Watteville, Madame Cusin, and a few others), but with hardly any exception teas have some scent, whereas many hybrid perpetuals have none, these scented varieties being frequently roses of great decorative and some exhibition value, notably Suzanne Rodocanachi, some of the varieties raised at Newtownards, and Her Majesty, Captain Christy, and some others. Captain Christy is one of the few hybrid teas which has no value as a scented variety, and it is not of high value as an exhibition flower, but it is of wide-world reputation. Most of the hybrid teas are delightfully scented, notably La France, Viscountess Folkestone, Augustine Guinoisseau, Kaiserin Augusta Victoria, and others, and they, also with the teas, have the valuable property of perpetual flowering power.

Those who only grow what we call H.P.s seldom can look forward to enjoying their rose gardens in the autumn, but the rosarian who grows only teas can look forward to roses, not only during what some call the rose season, *i.e.*, June and July, but also right up to the time of hard frosts, as teas are the true perpetual flowerers.

In concluding these few remarks I would advise those who cannot rely on their own experience and judgment, to consult some amateur or professional who has grown all kinds of roses, and ask their friend to make a selection of those roses which flower nearly all the year round. By avoiding the very delicate teas and only growing the perpetual flowering hybrids and hybrid teas, they will find that they can in most years depend on an ample supply of roses from mid-June to October, with little risk of loss in the winter.

CHARLES J. GRAHAME.

AUTUMN ROSES.

THOSE of us growing any number of roses must have arrived at the conclusion that the real perpetual bloomers are the tea scented varieties, whether pure teas, hybrid teas, or Chinas. No one could admire well-grown hybrid perpetuals more than I do, but I am convinced a larger amount of pleasure would be derived by the average cultivator of roses if more of the former were planted. "Autumn" was the subject our worthy Editor asked me to deal with, and I propose to add a list of those varieties which I have found to give the best late crops of blooms.

Friends, when looking at my roses late in the season, have very frequently asked if the blooms then on the plants were the second crop, but I have had to confess I could not say to which crop they belonged. The tea-scented roses are nearly the first to bloom, and with care and good cultivation many varieties continue producing flowers in the greatest profusion till absolutely stopped by frost. Therefore it is nearly impossible to say when one crop is over and another begins. I consider some special cultivation is necessary to ensure plenty of late flowers, as, distinct from early ones, the best preparation I know of being a good first crop on well thinned, healthy plants.

Taking it for granted the plants have been properly pruned, and are in a healthy state, care must be taken to thin out the weakly growths, and the earlier this is done the better. Some really good shoots, too, come anywhere but where one wants them to furnish a good plant, and these must, if possible, be dispensed with. Many may say they want a quantity of flowers and are not so particular as to the quality. Well, even then, judicious thinning must be resorted to. There are always several pieces of spindly growth which, if left, would never produce a flower, much less a decent one, while they would take a certain amount of sap, and obstruct the sun and air. Care should be taken to examine the plants and remove any deformed or damaged buds, and cut these shoots back a little. Time, and the energy of the plant, are both gained by not allowing these useless buds to grow on to maturity. If the first blooms are cut with moderately long stalks, the plants are sure to break well, the two top buds left on each shoot frequently running out, so that where one had, say, only six shoots, there would be nearly twice that number for the second crop.

To obtain blooms of any appreciable size on a second or subsequent growth, it is absolutely necessary to thin the buds, which, by some varieties, are produced in large trusses. I am not writing these few notes as an exhibitor of roses, nor for rosarians who take part in competitive gatherings, but as a grower of them for garden decoration and for [illegible], and I am certain the late blooms will be small and unsatisfactory if some little trouble be not expended on them. I do not think it advisable to give the rose plants any stimulant after the first crop of bloom has been gathered, for while in some few instances it might improve the later blooms, in most cases it would only excite strong growth, which would not ripen, and would make the plants most ready subjects for a bad attack of mildew. A good soaking with water and the frequent use of the Dutch hoe are all that are necessary to maintain a good growth but if mildew puts in an appearance—and some varieties are very subject to it—on the tender second growth, sulphur must be freely used. It may be thought by some that the cutting of fairly long stalks with the first blooms is apt to force buds into growth which should have been left dormant for the next year, but I have not found it so, and am convinced with many varieties we do not prune sufficiently hard, especially in a year like the present, when the mild winter left every shoot perfectly sound and uninjured.

The following thirty-six varieties, I consider, produce the best late crops of blooms, and to be the most useful to the average cultivator:

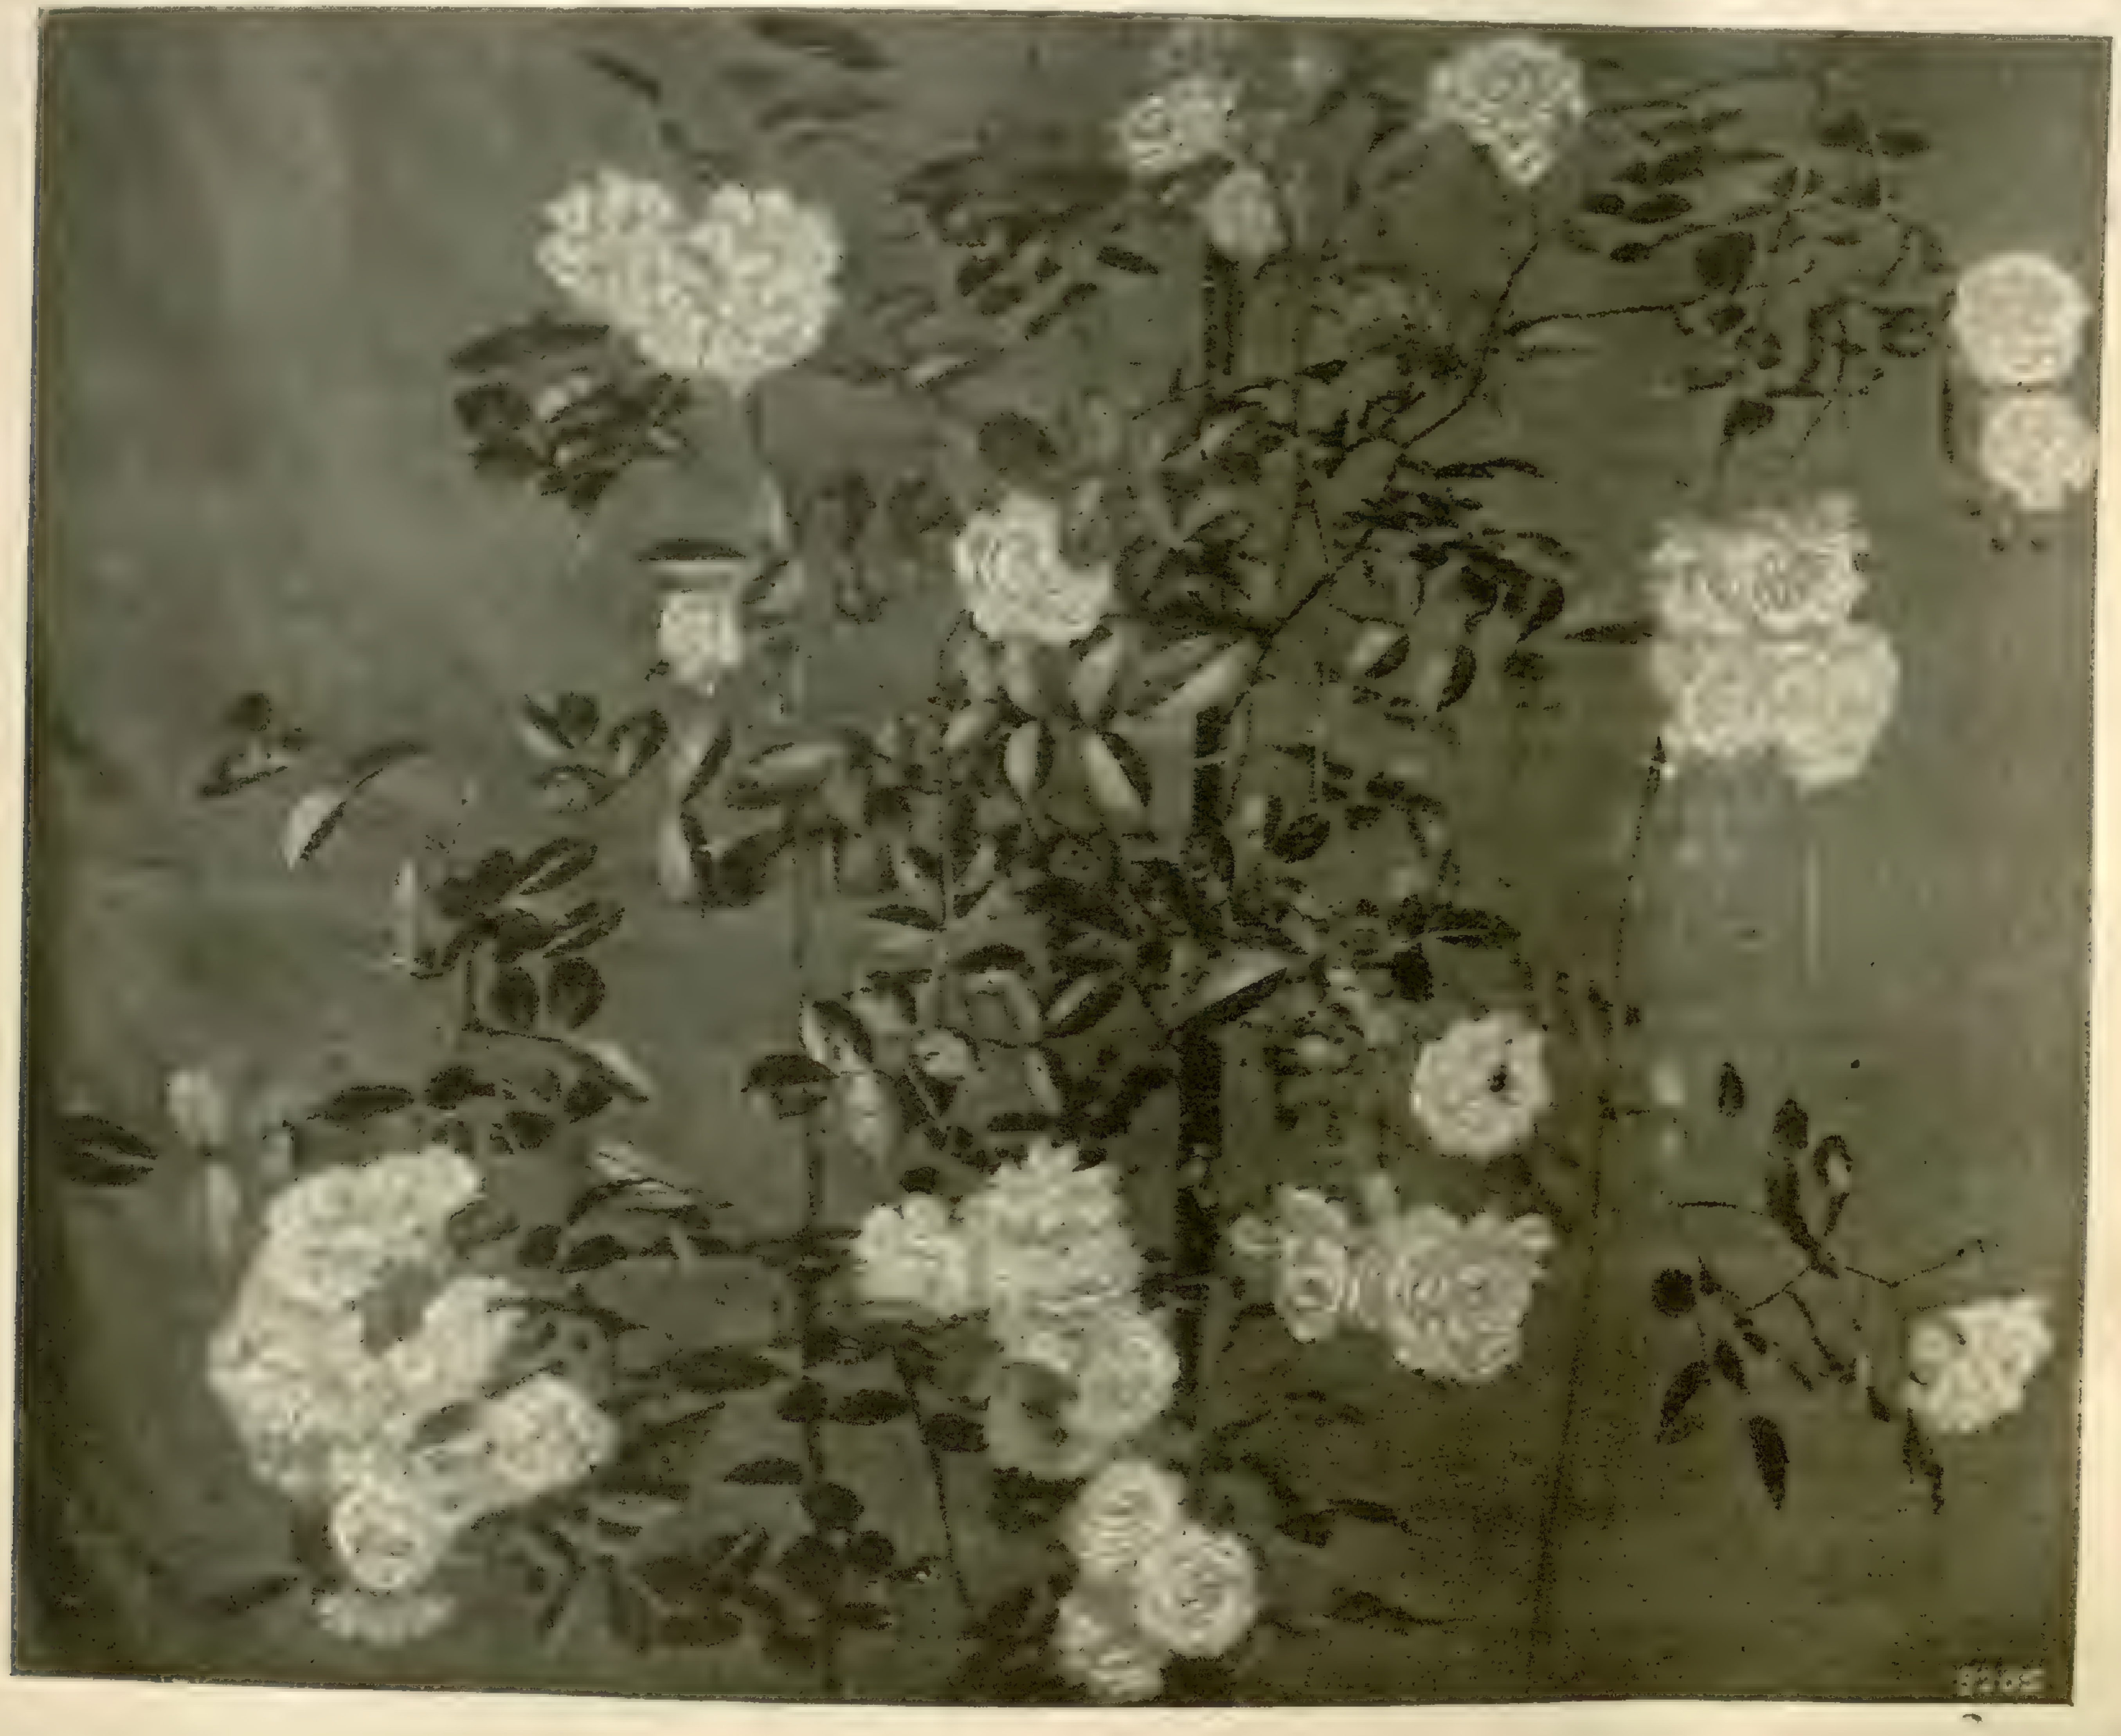
TEAS.—Adelina V. Morel, one of the best of the late small roses; Anna Olivier, Catherine Mermet, Corinna, Enchantress, Francisca Kruger, Hon. Edith Gifford, Innocente Pirola, L'Ideal, Ma Capucine, Madame Chedane Guinoisseau, Madame Cusin, Madame de Watteville, Madame Hoste, Madame Lambard, Madame Pierre Cochet, Maman Cochet, Marie van Houtte, Niphetos, Rubens, Souvenir de S. A. Prince, Souvenir d'un Ami, Sylph, The Bride, W. A. Richardson.

CHINA ROSES.—Fabvier, Laurette Messimy, Mrs. Bosanquet.

HYBRID TEAS.—Augustine Guinoisseau, Bordou Job, Caroline Testout, Gustave Regis, Kaiserin Augusta Victoria, La France, Mrs. W. J. Grant, Viscountess Folkestone.

With the majority of the teas and the hybrid teas I have had by far the best results from short standards, and Laurette Messimy does finely in that form. As I said before, these notes are not intended for those who grow roses well and in large numbers, but that they may be of some slight assistance to those that at present hardly consider themselves skilled rosarians.

West Bergholt. OSMOND G. ORPEN.



ROSA LUCIÆ MANDA'S TRIUMPH.

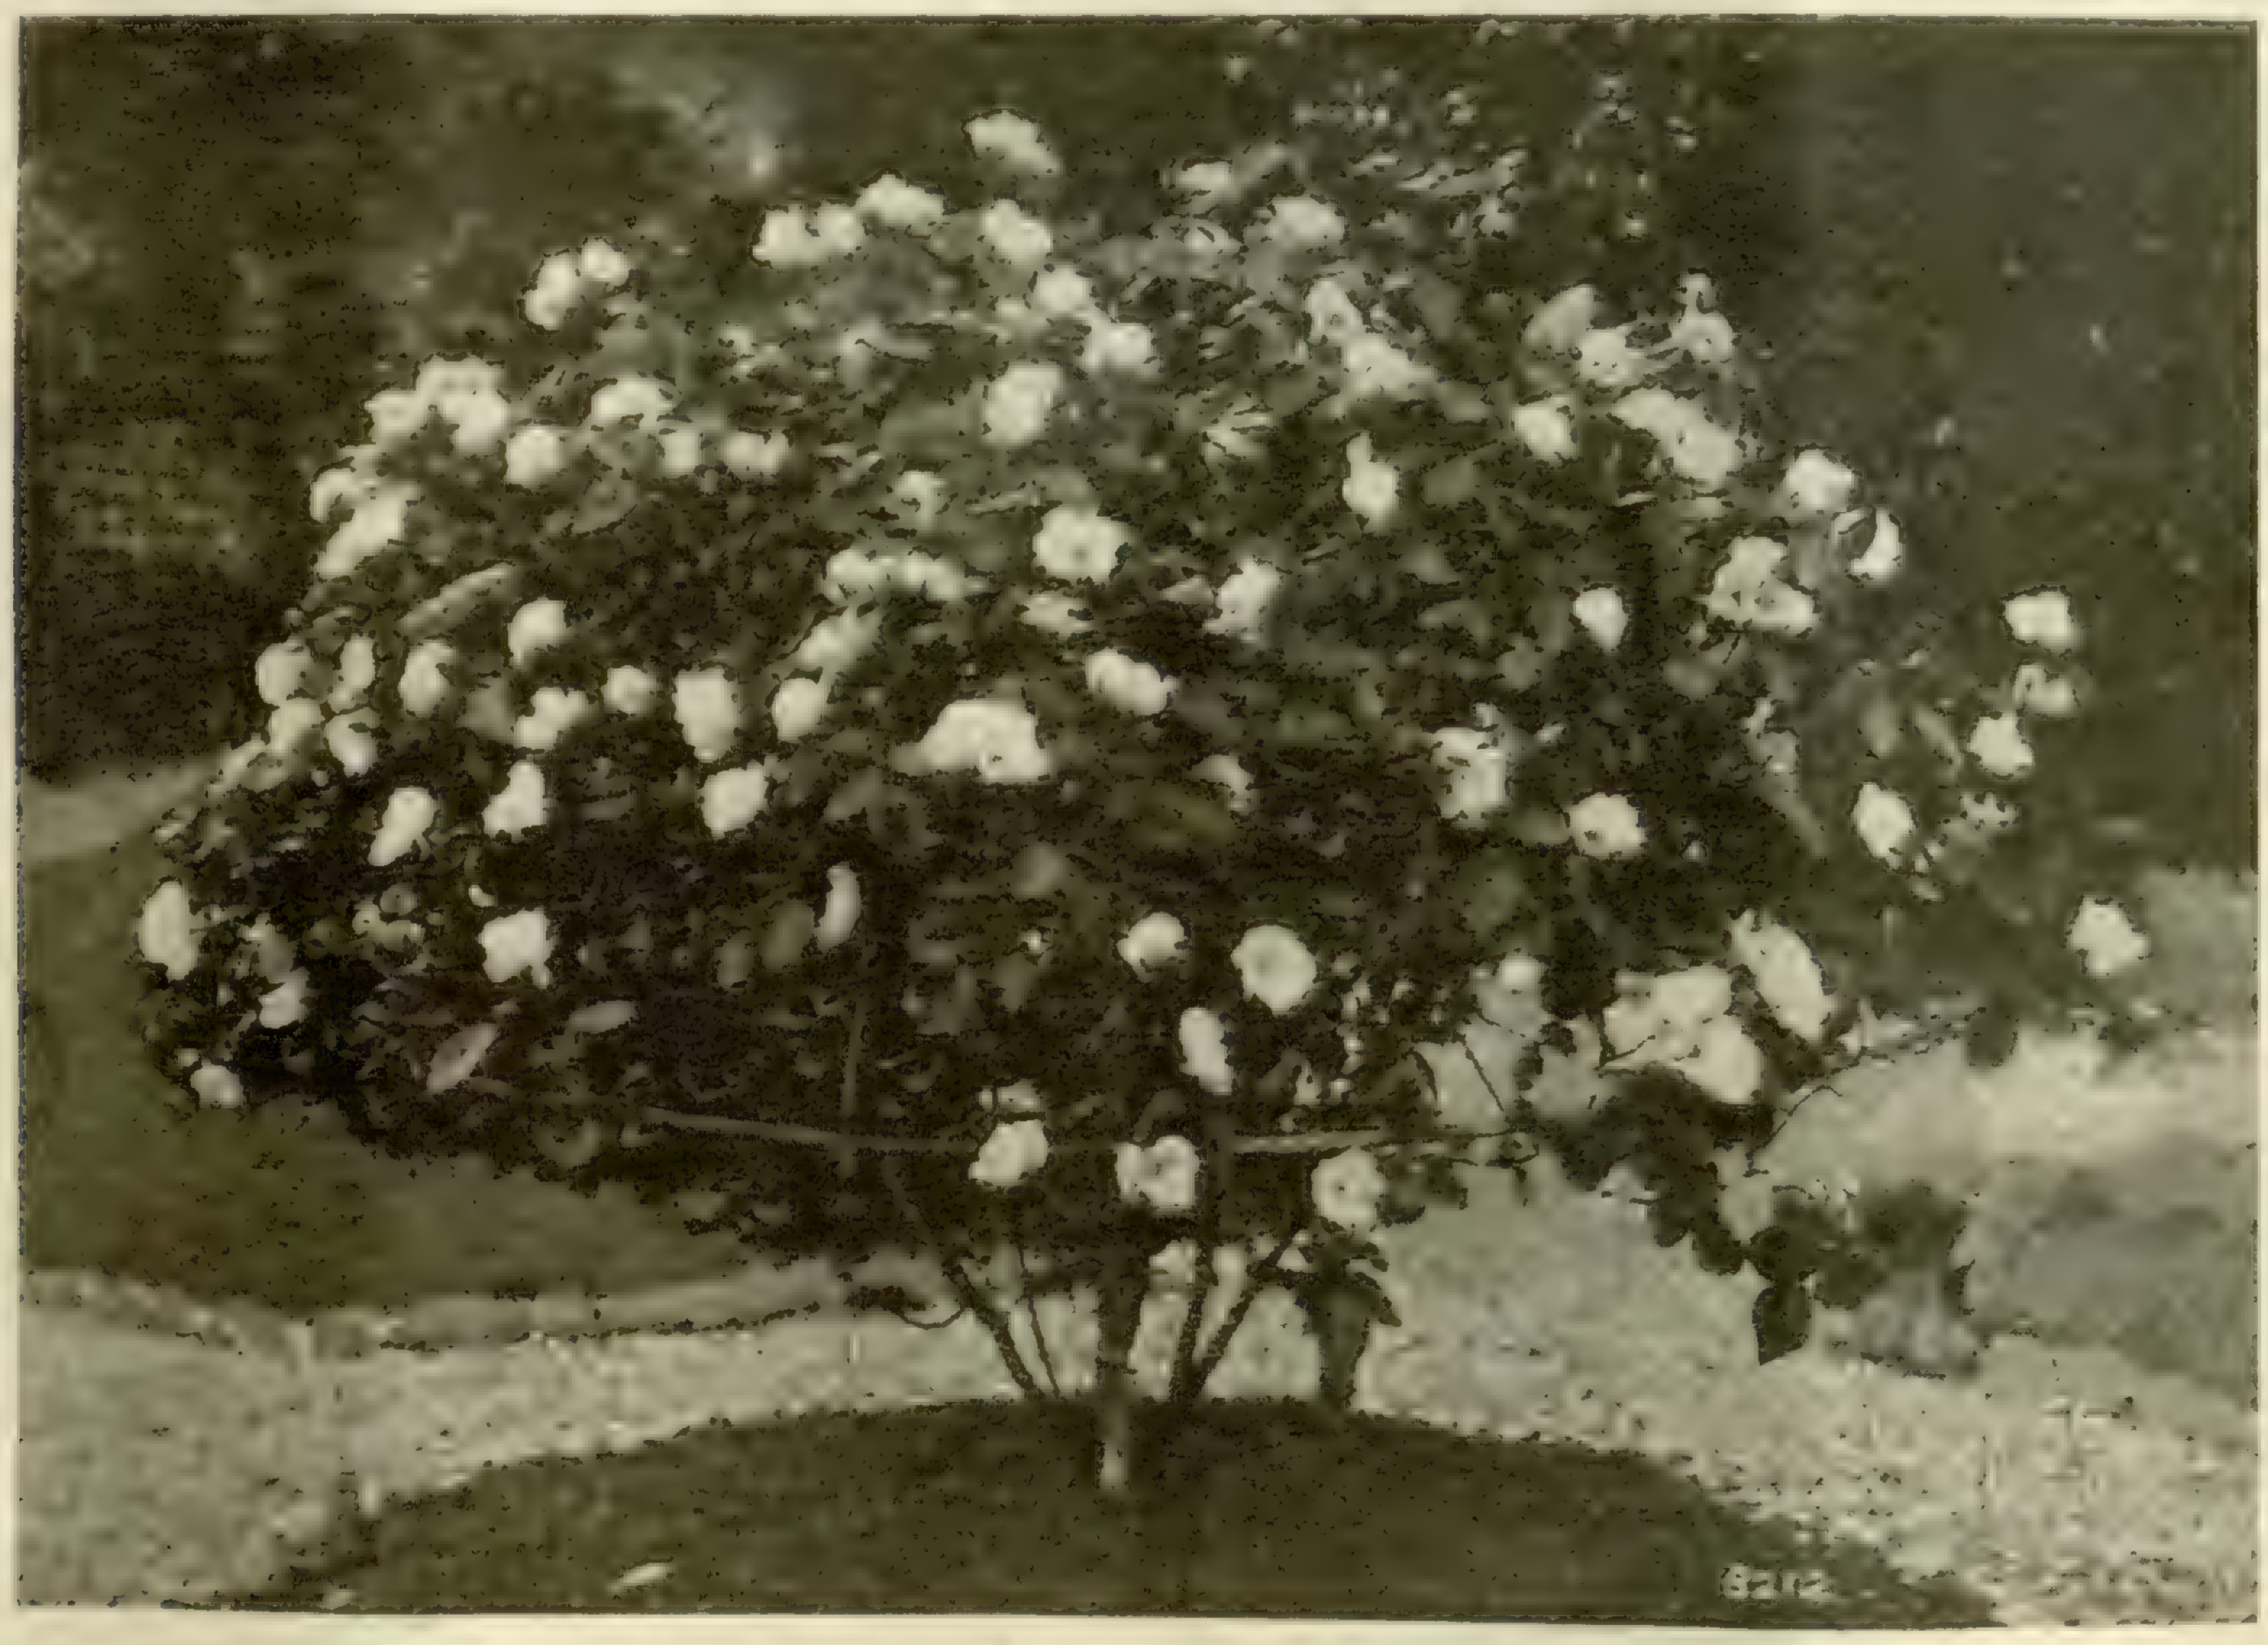
ROSA LUCIÆ VAR. MANDA'S TRIUMPH.

NOT very long ago a pretty Japanese rose was introduced to British gardens, chiefly through American horticulturists, and at once attracted attention by reason of its quaint and vigorous prostrate growth and white flowers. It was first made known under the name of Rosa Wichuraiana, and probably that name will stick to it for a long time, notwithstanding the authority of the *Bot. Mag.* at t. 7421 for the title of Rosa Luciæ. The story of the introduction of this species is given, together with an illustration, in the GARDENERS' MAGAZINE of August 17th, 1895, p. 508. The accompanying illustration represents one of the several charming hybrids of Rosa Luciæ produced by Mr. W. A. Manda, of New Jersey, U.S.A.; it is a distinct novelty, inasmuch as its flowers are double and white. As trailing plants for rockeries and rooteries, R. Luciæ and its several hybrids are eminently satisfactory, as here they show themselves off to the best advantage. As pot plants they are not a great success, owing to the length of the growths, but when allowed to assume their natural prostrate habit, few roses are prettier or more interesting. The variety figured is named Manda's Triumph, and was exhibited by Messrs. J. Veitch and Sons, Chelsea, at the Temple Show of May last.

SINGLE ROSES.

THOSE rose growers who have not tied themselves down exclusively to the culture of over-sized hybrid perpetuals, find that the presence of single roses gives a pleasing variety to the rose garden; and it is therefore not surprising that real lovers of the rose often prefer the simpler forms; consequently the culture of single roses has very much increased in recent years.

Much has been done, by the selection from the numerous species and their hybrids, of the finest and most useful kinds; improved forms and new colours have been added to the list of roses worthy of culture. But much remains to be done. When single roses regained the public fancy, the kinds which first came into notice were, of those with white flowers, Rosa macrantha, R. Biggiriana, R. rugosa alba, R. moschata alba, R. multiflora (*Polyantha simplex*), all fine forms; R. lævigata (*R. sinica*), the camellia rose, is too shy in this country to have here maintained the reputation won in kindlier climes. Paul's Single White, of which so fine an illustration is given herewith, proved a real advance. It is perpetual in flowering, in colour pure, in habit graceful, and is probably as yet the finest single white rose. It is a hybrid noisette. R. altaica, a large lemon-white Scotch, and R. pulverulenta, are the two earliest single roses.



SPECIMEN OF PAUL'S SINGLE WHITE ROSE, AT ENYS.

Most of the single roses with pink and rose-coloured flowers are too small and insignificant for garden purposes. The best of these are Rosa macrophylla, a tall, almost tree-like climbing variety; R. rugosa, the true large flowered form, and its variety R. America, more pendant in habit, and with black crimson ovate fruits; R. pomifera, pale blush pink with fine fruit, and the single Gallicas. The Indicas, free-flowering and perpetual, are almost the only others, but R. rubrifolia and R. lucida are much grown for their foliage, and deservedly so. Mr. Jackson Dawson, of the Arnold Arboretum, U.S.A., tells me that R. setigera, and its hybrids, aremuch used as climbers in America. Rosa canina, the dog rose, is always beautiful, and its varieties, Andersoni, deep rose-pink, and, I think, Omissa, very large blush-white, are very showy indeed. R. sancta, with bunches of large china-pink flowers and woolly leaves, has been lately introduced from Abyssinia, has proved identical with flowers found in the wreaths of the Egyptian mummies, and evidently no novelty. A new hybrid of R. sinica and R. canina—R. anemone, has blooms for all the world like the Japanese anemone, and is a singularly attractive climber with shiny-green foliage.

Lord Penzance's hybrids have proved the value of the sweetbriar. Of the single yellows, the Austrian briars and the single Scotch are really good, and remarkably attractive during their flowering season, and have given us our richest coloured doubles, but R. berberifolia (*simplicifolia*) and its hybrid Hardi are merely fascinating curiosities, and Ecæ flowers very rarely, only favouring distinguished amateur growers like the Rev. V. H. Pemberton with its blooms.

That mystery amongst roses, Gigantea, was long known to us solely by the dried flowers in the Kew herbarium, but has at last been flowered at Cannes by Lord Brougham, who, kindly sending flowers to us, describes it as follows:—"It made growths last summer of from thirty-five to forty feet, only one flower on the top of each growth; five leaves of a golden white, yellow centre, an unusual quantity of pollen. The largest we have yet gathered are just six inches in diameter. From the appearance of some of the buds which have yet to open, I think, we shall have blooms of considerably greater size; in form and size it much resembles a clematis." The introduction of such a strain into our hybrids might materially affect the character of our future climbing roses. The toughness of petal and great breadth of flower are particularly noticeable.

Turning to the high coloured singles, it must be said that Carmine Pillar, Royal Scarlet, and Cooling's Crimson Bedder are the only single bright red roses we have, and are all quite recent introductions—seedlings from double kinds, and thus partial reversions to type. The first-named has not retained the perpetual character, but the other two possesses it in a marked degree. Carmine Pillar and Royal Scarlet produce their flowers in large bunches, each bloom opening in succession, and the duration of the time of flowering is materially increased. In the case of Royal Scarlet, this property and the perpetual character have produced a continuous blooming variety, the first blooms of the new growth almost immediately following the first bunches.

In addition to their great usefulness for garden decoration, single roses possess an indirect value, inasmuch as they lend themselves readily to hybridization; and it is evident that the introduction of new species must modify extensively the characteristics and habits of roses, and may produce novelties of a kind yet undreamt of—only care must be taken to retain the hardiness and vigour of our present kinds.

Cheshunt. GEORGE LAING PAUL.

ROSE GROWERS' DIFFICULTIES.

THERE is, I should imagine, scarcely any other plant generally grown which is so beset with enemies of all kinds as the rose. From the time it unfolds its first leaf until the foliage disappears at the approach of winter, it is seldom free from troubles of one sort or another. But, although the enemies of our Floral Queen are so numerous, they can nearly all be traced back to one common origin—the weather. In fact, if only our roses could have the climatic conditions they most delight in at each season of the year as it came round, the difficulties of the rosarian would disappear almost entirely.

The fact is, our cultivated roses are so extremely sensitive to weather changes of all kinds, as to be greatly at the mercy of the seasons. I refer, of course, to the choicer specimens of the race, the hybrid perpetuals, the hybrid teas, and the teas and noisettes. Indeed, I had such roses in my mind when I said just now that, were it not for unfavourable atmospheric conditions, rose growing would be sheared of all, or very nearly all, its anxieties and troubles. For were our attention directed solely to the cultivation of our native roses, or of such garden varieties as Bennett's Seedling, and similar sorts which are of strictly vigorous constitution and perfectly hardy, we might snap our fingers at the weather and its vagaries, and year by year, with the most meagre attention, look forward with certainty to a short, but abundant, harvest of bloom.

But, to proceed from generalities to more detailed illustrations, suppose, for instance, a young rosarian, smitten with the beauty of the flowers he has seen at a rose show, determines to try and raise specimens as fine in his own garden. He selects, as he has been advised, an open situation for this his first rose-bed. The ground is carefully prepared, and at last the long-looked-for plants arrive from the nursery. Thus far there has been nothing but pleasurable anticipation; but from the moment the straw bundle containing the selected varieties is opened his troubles may be said to begin. For either the ground may at that particular period be frozen hard, or the surface so saturated with wet as to render any idea of getting the plants into the bed impracticable. After a time the weather moderates, and if this ardent rosarian is not in too great a hurry the important operation of planting is carried out under as favourable circumstances as could be wished. Should a mild winter follow, his new plants will be greatly benefited, but should it prove unusually severe, some of the more delicate sorts may never live to the next summer's sun, while the rest can only be expected to start bly into growth in the spring.

But there is no reason at all to draw upon our imagination, besides which, all the ills that the rose is heir to do not come upon it during a single rose year, so we will take as an example the past winter, one of the most favourable in recent years for the establishment of young plants in their new quarters. We can therefore picture the plants of our young enthusiast at the end of the winter season as having made satisfactory growth. So far so good. Still, keeping to the experiences of the present year, we find that towards the end of March or beginning of April the young shoots were shortened. For with young plants, such early pruning as is recommended for established roses is not advisable. In due time the young leaves made their appearance, and with them innumerable grubs and caterpillars.

After the destruction of these insect pests all went well with the plants for a time, but not so with the young rosarian himself, who must have often gone to bed in fear and trembling whenever a night frost threatened, knowing what havoc such spring frosts, when unusually severe, make in a rose garden; and as the season advances the greater becomes the dread of such frosts, because the more permanent are the injuries inflicted likely to be. Fortunately, most rose gardens escaped serious damage this year from cold during the spring months, although the easterly winds were for a time very trying.

There, however, occurred two cold periods in June, the first of which checked the growth of the plants and hardened the more forward flower buds. Added to which, it brought with it one of the worst and most persistent attacks of green-fly known for some years. There was one peculiarity of growth which must also be attributed either to this check or to the cold weather in the latter half of May, and that was a tendency for certain varieties to send up long tapering shoots showing signs of a flower bud until a foot high. With the second cold period came a worse enemy even than aphis, and that was a visitation of mildew.

The above recital indicates sufficiently clearly some of the worries of the present rose season, but of course, to those rosarians who are also exhibitors, the greatest worry of all has been the backwardness of a season when all the early rose shows had to be held without roses, or at all events, with blooms which the exhibitors were in most cases ashamed to set up, so far short did they fall of their ordinary exhibition form.

It may at first sight appear difficult to understand in what consists the charm and fascination experienced by the votaries of the rose. I suppose the fact is we all take pleasure in contending against adverse circumstances, and in this way rose-growing becomes a species of sport. I have given a sketch of the drawbacks of a single rose season, but these may only be taken as being to a certain extent representative. For no two rose years are alike, each having its own peculiar drawbacks and advantages.

However, be the trials and disappointments what they may, and I have tried not to exaggerate them, the fact remains that the hobby of rose growing is one of the most delightful and fascinating recreations in life, and like all hobbies of the first order, the interest in it increases the longer it is indulged in. I have dwelt, as in duty bound, upon the trials of the present rose year, but there is a bright as well as a gloomy view to be taken of it. No doubt it is a very late season, and has certainly proved a most provoking one, but where the plants have received their due measure of attention, there appears every prospect that when the main crop of flowers does appear, be it during July, or, as some northern growers have predicted, "somewhere about Christmas," the blooms are likely to be unusually fine.

Rosebank, Great Berkhamsted.

EDWARD MAWLEY.

THE YELLOW ABYSSINIAN ROSE

(Rosa ecæ or Rosa xanthina).

A FEW notes on this charming deep yellow coloured rose species are herewith offered as a contribution to the Rose Number of the GARDENERS' MAGAZINE, with the hope that they may prove to be of interest to lovers of decorative roses, especially so, as in consequence of the difficulty hitherto experienced in getting it to flower, it is but little known.

Some hips of this species were brought from Abyssinia by Dr. Aitchinson a few years ago, and plants from this seed were raised at Kew. The authorities there have only one plant of it, and this plant can be seen growing on the rockery. It was, when I saw it on June 13 of this year, just off flower, and upon inquiry was told that it had had some five or six blooms. Last year it did not flower, but in 1896 it bloomed profusely. This species, named by Dr. Aitchinson Rosa ecæ, is thought to be identical with Rosa xanthina, a native of Afghanistan and Persia, described by Lindley and in Hookers "Icones Plantarum." It bears the latter name on the Kew rockery.

The plant in the illustration came from Mr. George Paul, of Cheshunt, who describes it in his catalogue under the section of botanical varieties as "Rosa ecæ, the yellow Abyssinian rose." Mr. Paul obtained his first plant from Kew. We have had the plant about six years. It was very small, and in a pot, but we ventured to plant it out under a south wall in light sandy soil, and kept it dry. For three or four years, until it became established and had made fair growth, it was protected during the depth of winter by a handlight, but it has had no protection for the last two years, having in the meantime grown to between four and five feet high, and wide in proportion. After throwing up some strong shoots in the spring of 1897, which became well ripened in the summer, it has bloomed this year for the first time, and has borne between fifty and sixty flowers, which began to open on May 19. The flowers were single, about three-quarters of an inch in diameter, a deep yellow in colour, inclining to orange, like the marsh marigold or kingcup; petals and stamens of an even shade, very sweet scented. I was given to understand that, except at Kew in 1896, it had not blossomed in England, and therefore upon its coming into flower with us here we thought it would be worth photographing. We are indebted to Mr. Arthur Cornell, of Romford, for the photograph, taken in our garden as the rose came into flower. It was not at its best then, but we were afraid to wait, because of the unsettled weather. A few days later it was more fully out, with better developed blooms, each shoot bearing on the laterals a row of golden flowers gleaming in the sunshine, the effect of which was very charming.

ROSA ECÆ.

I would recommend rosarians who may possess a plant of this species not to discard it because it does not happen to come into flower for the first few years, but to wait until the plant attains to a certain age and size, and their patience will probably be amply rewarded.

Havering.

JOSEPH H. PEMBERTON.

Messrs. James Backhouse and Son, Limited.—This company has been registered with a capital of £60,000, in £10 shares (of which 3,000 are preference). The objects of the company are to acquire and take over as a going concern the business now carried on under the style of Messrs. James Backhouse and Son at the Nurseries, York, and elsewhere, to enter into an agreement with Mr. James Backhouse, and to carry on the business of nurserymen, seedsmen, landscape gardeners, dealers in garden and other implements and appliances, and all materials for use in connection with gardening and laying out grounds, and contractors for the making of artificial rockwork, and for making, keeping and maintaining gardens, parks, and grounds. The first directors are: Mr. James Backhouse, Mr. James B. Crosfield, Mr. Samuel Doncaster, and Mr. Joseph S. Gray.

ROSES FOR COTTAGE WALLS.

I SUPPOSE that our omniscient Editor has selected me to deal with this subject, because I live in a part—the Isle of Wight—where roses on cottage walls are more abundant than in most parts of the kingdom, though the more favoured parts of Devon and Cornwall are quite as well suited to bear them, and, so far as I remember, do so as freely. However, at any rate here, thank heaven, we do not see very much—though far too much—of that accursed destroying parasite, the ivy, which in more northerly counties people plant on their cottages to save themselves trouble. And what a pity it is to think that one-tenth of the trouble that will have to be taken to keep the ivy down and repair the serious damage that it does, let alone the certain insects and probable rats that it harbours, would have sufficed to cover the walls with the exquisitely refined Ampelossis Veitchi, and with any number of different coloured roses, provided they were wisely chosen, and decently tended!

My own village of Shorwell is, I think, on the whole, the rosiest village in the island, but several others are much like it in this respect, and I fancy (from hasty inspection) that you will see more roses on walls in the outer streets and lanes of Ryde, particularly in the Swanmore part, than you will in any of the villages. One or two roses, however, were, it seemed to me, thought quite enough for each cottage, and the choice was apparently quite at random, and without any reference to the particular aspect, or to the habit of the particular rose and its economy of space. The front wall of a cottage, facing south, when all covered with Reine Marie Henriette, for example, looks very nice from a coach-top in June, but this rose will probably not give one really good bloom, while there might have been two first-class roses of different colours.

The roses which I find in most general use in the cottages here are Gloire de Dijon (of course), Devoniensis (almost a speciality of ourselves and Devonians), General Jacqueminot, Reine Marie Henriette, Maréchal Niel (only possible in the milder climates), Jules Margottin (not the modern climbing variety, but simply climbing by its own vigour), the old pink China rose, and an old red rose of which I am not sure, possibly Edouard Morren. On the whole this is not a bad selection, though it might be improved. There are, of course, specimens here and there of many others, including the only one I ever saw of Madame Levet, an almost forgotten seedling of Gloire de Dijon, of a deeper shade of yellow than its parent; Solfaterre, Marie Leonida, Lamarque, and a few others, if we make an accurate census. The Banksians, both yellow and white, grow profusely over my own vicarage, and I have the grandest tree I have ever seen of William Allen Richardson, which, not finding enough scope in two stories, is now trying its effect on the roof. To these I have added several by gifts in the village, as of Cloth of Gold (which we ought to grow, if anybody can), William Allen Richardson, and Crimson Rambler; while a beautiful Madame de Watteville, budded from mine on a lady's single-storied wall, under thatch, was formerly a sight for the gods to envy. I am informed that, according to the Talmud, roses are grown in Paradise, so that we may look forward hereafter to the post of assistant-gardeners, if we qualify by diligence here.

I think, then, that the most helpful thing I can do is, first, to discuss a few general principles needed to be borne in mind, epecially for choosing roses for walls; and, secondly, to name and criticise a few leading varieties most likely to be used, or most suited for carrying out these principles.

1. For a high wall (say of two stories) a real rampant or climbing rose is needed. Many times I have seen a good rose on a wall, expected to do its twelve or fourteen feet, when six feet was an effort for it.

2. For a low wall (single story) it is probably better here (I speak without sufficient knowledge of more northerly climates, as far as regards rose growing) to take a vigorous rose which is not ordinarily described as a climber. I have, for example, on a small piece of east wall, a Maman Cochet, which covers its seven feet, and gives early blooms of show quality. Some people would have put a Gloire de Dijon here, if anything, and wasted the space.

3. Always consider the aspect and the standing of every little scrap of wall you possess (I have only a few scraps), and do not put in Gloire de Dijon everywhere, simply because it is the only rose whose name one can remember, or because a small local nurseryman has hardly anything else in stock. You can get a good plant of any sort from one of the great nurserymen safely by post, or a bundle by rail, and the good and great nurseryman will do his best to suit you, even for a tiny order—such is the true rose spirit—if you will only say exactly what you really want, and leave it to him to choose for you. If you have more walls than one, put a really good rose on your south or west wall. Here, at any rate, and in any tolerably favourable place, you ought to be able on a south wall to grow a Maréchal Niel, or Rubens, or Niphetos, and have lovely blooms from them to stand in specimen glasses on your table, or, perhaps, to be the boast of the local show, instead of a heap of shapeless roses.

4. All roses on walls are terribly subject to blight of various kinds, more than those in the open ground, chiefly the aphis, or green-fly. It will not do to leave them to chance, if you want your wall to look beautiful. You must syringe them as much as ever you can. There are many insecticides. One of the simplest is four ounces of quassia chips, to be had from any chemist, boiled in a gallon of soft water, and mixed with four ounces of soft soap.

5. Roses on walls, probably, have not got good soil immediately under them, while owing to their large growth they need good food. Give them all the food you can, for they well deserve it—road scrapings, stable manure (always to be well diluted), any blood you can get at, sour milk, anything. The rose has heavenly gratitude for it all.

6. Roses running up to any height on a wall tend to become bare on the lower parts, and be rather unsightly thereby. But if they are sufficiently widely spaced, you can put non-climbing, low-growing roses of a different colour, between them, and cover up all your wall. Only you must, of course, remember that this exhausts more of the ground, and you must, therefore, proportionately feed it, or the big rose with long tap-roots, and shoots towering above, will eat up all the food in the soil before the little rose can get at it at all.

7. Never plant a mere summer rose, like Charles Lawson. Some roses will bloom for more months than the others will for weeks.

I will now run through a few of the different sorts most likely or most advisable to be used as climbers, with a few notes on each.

We naturally begin with the universal maid-of-all-work, the Gloire de Dijon, and its descendants. It has, as everybody knows, many excellent qualities. It is very hardy, does not much mind where it is put, is very early and very sweet, and some of its shades of colour are pretty in sufficient masses. But it is about the most utterly shapeless rose that exists, and what is more curious, the exceedingly rare blooms of tolerable shape seem just as likely to come in a wind-swept situation as on a sheltered south wall, so that it is clearly a pity to waste on it the favoured spot which might have had a Maréchal Niel. Madame Berard, a daughter of the Gloire, is far better in shape, and deeper and more uniform in colour. It is not quite so hardy, but hardy enough, and rather more ambitious in climbing. Bouquet d'Or also greatly resembles both its mother and sister, but is of a brighter colour, and very pretty in bud.

Reine Marie Henriette, often called "the Red Glory," a daughter of Madame Berard and General Jacqueminot, is of a bright cherry colour when it comes out, but fades very rapidly. It is most annoying in shape, an immense proportion of blooms being tightly doubled in.

Waltham Climber No. 1 is said to be from the Gloire crossed with a red rose. The colour fades very quickly, and the shape is generally poor. It is a strong grower and very early, but I do not recommend it. Cheshunt Hybrid is of a charming colour in bud, but opens out into the most ghastly lilac-red. It is strong, early, and one of the sweetest of roses, but of little use for cutting owing to its tendency to fade quickly.

Maréchal Niel, though raised thirty-four years ago, is thought by many good judges to be still the most beautiful of all roses. More blooms of it and Niphetos are raised for sale to florists than of any other. It should have the very best situation that can possibly be given to it, and on a south wall, with protecting eaves overhead, it will give far richer-coloured blooms than in a greenhouse.

Of the climbing variety of Niphetos very much the same may be said as of Maréchal Niel. It is too delicate for any but very favoured situations, such as a sheltered south brick wall, with eaves over it, and it is too shy about flowering unless it is thoroughly satisfied. But a perfect Niphetos is the loveliest thing imaginable, and even quite second-rate blooms will always sell readily at the florists. I may mention here another white rose, not nearly so widely used as it deserves to be, but very different from Niphetos, viz, Madame Alfred Carrière. This is one of the most rampant of all growers, and does not seem to mind where it is put, so that it may be used quite as freely as the Gloire. It has a powerful scent, which the catalogues call "deliciously fragrant," but which I have heard called "horrid." It would be a decidedly pleasant change from the eternal Gloire to see a cottage covered with its light green foliage, studded with large showy white blossoms.

One of the most useful acquisitions of late years has been Turner's Crimson Rambler. I believe that this grand polyantha does better on arches, or pillars of a verandah, or in a hedge, than on walls, which would discount it for our present purpose. But if it can be found a situation which suits it, the enormous masses of blossom all coming together into divided clumps like great swarms of crimson bees, are well worth trying to secure. And we, at least, find the plant so rampant and so hardy that it gives no trouble anywhere. Paul's Carmine Pillar is an exceedingly effective single rose in colour, but I do not know what its peculiarities may be in regard to walls. I should think it would be too much of a summer rose to advise; and the same would apply to all Lord Penzance's hybrid sweet briars. William Allen Richardson is of such a beautiful and uncommon colour that it is popular everywhere, and grows readily in the more northerly counties. Madame Carnot, a seedling from it, is more beautiful in colour, but it seems to be too delicate for general use.

It will be noticed that in these numerous varieties I have touched upon there are no dark roses at all, which is a serious gap. Any raiser who succeeds in producing a really rampant dark rose has a great chance before him. The climbing sports advertised from time to time of well-known roses need some years to test them, and, generally, have soon dropped out. Here, as I said above, General Jacqueminot is mostly used for that purpose, though it is not even considered a half-climber. But I think that any of the stronger dark roses, such as Baron de Bonstetten or Crown Prince, both giving beautiful show blooms, would cover perfectly well a single-storied piece of wall. One very good variety, not so well known as it deserves to be, is Glory of Cheshunt, a rather small, but very rich-coloured variety, which does well with me on a wire arch. It is said to be a seedling of Charles Lefebvre, but I find it hard to believe this.

Lastly, if the rougher places of the wall are thought or found to be too rough even for Gloire de Dijon or Madame Alfred Carrière, we can fall back on the closely akin Ayrshire and Sempervirens (Evergreen) roses, which will do anywhere, but seldom get even the worst piece of wall. Mine all climb round the trunks of big trees, and form a great feature in the garden. There is no great variety in them, either of colour or growth; the Dundee Rambler, Ruga, Flora, and Félicité-Perpetue are, perhaps, the best known.

Let us hear the conclusion of the whole matter. If the cottage walls be already covered with roses, let them stay till they fail. They cannot be expected to go on for ever, as some people seem to expect, even if they are well fed, which is rarely the case. When one begins to fail from age have it out—it is kinder to the rose as well as to yourself—and put in, say from the list, one which will be in contrast of colour to the others still there. If the walls be new you have a fine chance. Consider your breadth and height of walls, and their comparative shelter and sunniness, and select for each place accordingly.

G. E. JEANS.

Shorwell Vicarage, Isle of Wight.

WILD ROSES.

The hedgerows are now bespangled with the delicately tinted flowers of the dog rose, or, to give the shrub its scientific appellation, Rosa canina, and the effect produced by the long flower-laden branches, swayed by the passing breeze, is so surprisingly beautiful that in visiting country districts where this charming wilding is placed under conditions favourable to its full development, we readily acknowledge with Wordsworth—

> "How sweet it is when mother Fancy rocks
> The wayward brain, to saunter through a wood!
> An old place, full of many a lowly brood,
> Tall trees, green arbours, and grand flowers in flocks,
> And wild rose tiptoe on hawthorn stocks,
> Like to a bonny lass, who plays her pranks
> At wakes and fairs with wandering mountebanks—
> When she stands cresting the clown's head, and mocks
> The crowd beneath her."

There are several other roses indigenous to this country, but this has the strongest claims to be regarded as the wild rose of England. It is common in all parts of the country, and its deep pink and blush-coloured flowers, and bright rose-tinted buds, interspersed with the fresh green elegant leafage, add immensely to the charms of country lane and woodland walk at this season of the year, these in their turn to be succeeded by the bright red hips which present such an attractive appearance during the autumn. It is not alone in the hedgerow that the dog rose appears to advantage, for on railway banks, waste spaces by the roadside, and in meadows where a few bushes away from the boundaries are not regarded as objectionable, it may be seen displaying a wealth of floral beauty that specimens associated with other forms of arborescent vegetation strive in vain to emulate. In positions such as those mentioned, we may see the dog roses forming bushes ten or twelve feet through, and of a pro[illegible]tion height; and apart from their charms when every shoot is a garland of flowers, they are of especial interest as suggesting to cultivators of roses the desirability of allowing the roses on which they lavish their care more latitude of growth. In the garden the roses are pruned annually with so great a severity that they increase but little in size, whereas the wildings, free from the ever active pruning knife, extend on all sides, and annually produce immense numbers of flowers. In the production of blooms of the hybrid perpetuals and some other classes with which to win honours at exhibitions, rather hard cutting back is no doubt necessary, but in the case of the free growing kinds collectively known as garden roses, very little pruning indeed is required. This has long been the teaching of the GARDENERS' MAGAZINE, and its Editor must be highly gratified to know that the most successful of the amateur and professional rosarians now recognize this view as the correct one. The dog rose teaches us the importance of allowing the [illegible] kinds to follow their bent, and make plenty of wood as the foundation of a profusion of flowers. This teaching has only been recently accepted as sound by any considerable proportion of rosarians, and there are still so large a number who have not taken advantage of it that it would be well to plant one or two specimens of the dog rose in the pleasure grounds of country residences where they could run riot and demonstrate the possibilities of roses in flower production when the pruning is limited to the removal of the weakly shoots. Were this to be done we should find many owners of gardens, who have not as yet fully recognized the charms of wild roses, saying

> "Yes, lovely flower, I find in thee
> Wild sweetness which no words express,
> And charms in thy simplicity
> That dwell not in the pride of dress."

The dog rose is hardly less interesting than beautiful, for there are many traditions relating to it, and it may be regarded as the progenitor of many of the beautiful of the roses that have found a home in English gardens. "Wild roses!" exclaims Sir Edwin Arnold. "That leads us back to yonder splendid and sumptuous white Devon Queens of the garden, hanging their scented heads in garlands of beauty round these windows. If we could only do as much by education for the races of man as the gardeners since Adam have done with the common dog rose, what would not be the progress of humanity by now? All the wonderful varieties of the rose—the thousand graces and glories which she wears in doubled and trebled blossoms of crimson and claret, saffron and scarlet, palest pink and deep glowing gold, milky or pearly and creamy shades, or else Imperial purple, lemon-yellow, sulphur or salmon, or snowy-white, with her own special and self-named 'rose-colour'—these all are offshoots of the humble hedge bramble, which was Nature's first draught plan of the Royal flower that has filled literature, inspired the poetry of 3,000 years, taught colour and form to painters, and their moonlight music to the nightingales of Shiraz." It may not be absolutely correct to state that "all the wonderful varieties" of roses that grace our gardens have descended from the "common dog rose," but there can be no question as to the varieties which constitute the chief splendour of the rose garden having descended from it. Rosa canina has a very wide distribution, and is in consequence a very variable plant, being, like many others, greatly influenced by different conditions of soil and climate. Bearing the fact in mind that the most important of the cultivated roses belong to the caninæ group, it is somewhat remarkable that among the many varieties of the common dog rose none have acquired renown as garden roses. But hitherto rosarians have not bestowed a thought on the possible value of its pollen, though for ever absorbed in admiration of the actual value of its hungry roots. Its possibilities as a pollen and seed-bearing plant are evidently now being recognised, for one of our rose growing firms has presented to public notice a variety obtained by fertilising the flowers of the dog rose with pollen from either a tea-scented or noisette. As shown at the National Rose Society's exhibition, the flowers are sufficiently beautiful to justify it in obtaining prominence, and to encourage further experiments in the same direction. It is reasonable to assume that by hybridising some of the twenty-five or twenty-six recognised varieties of R. canina with the best of the garden roses, a race of varieties distinguished by their vigour and hardiness, and of a high degree of utility for the wild garden and woodland walks, would be obtained.

"THE SWEET WILD ROSE
STARRING EACH BUSH IN LANES AND GLADES."

At some period in the far distant past this beautiful wilding was not regarded with particular favour, and had the term canker rose applied to it, presumably as an expression of contempt; and in this contempt the poets of three centuries ago have shared, as is evident from Shakespeare's fifty-fourth sonnet, in which he says:—

> "The rose looks fair, but fairer we it deem
> For that sweet odour that doth in it live.
> The canker-blooms have full as deep a dye
> As the perfumed tincture of the roses,
> Hang on such thorns and play as wantonly
> When summer's breath their marked buds discloses;
> But, for their virtue only is their show,
> They live unwoo'd, and unrespected fade;
> Die to themselves—sweet roses do not so;
> Of their sweet deaths are sweetest odours made."

Another species that should have prominence in reference to wild roses is the Sweetbriar (Rosa rubiginosa), which has long been held in high estimation, and was a favourite with the older poets, Chaucer writes: "Suddenly I felt so sweet an air of eglentere."

Shakespeare regarded its leafage as representing the highest type of fragrance, "The leaf of eglantine, whom not to slander, out-sweetened not thy breath." Spencer observes, "Sweet is the eglantine." Keats describes the shrub as "Dew-sweet eglantine" and as "Rain-scented eglantine." Wordsworth speaks of it as "Thou one fair shrub," and with a view to the extension of the shrub, Scott suggests that we "Leave untrained the eglantine." The shrub is well deserving of the highest praise that has been bestowed upon it, and there can be no question that when its progeny, which we owe to Lord Penzance, becomes fully known, it will have representatives in every garden that is large enough to afford room for free-growing shrubs. The results that have been obtained in the hybridisation of the sweetbriar with the garden roses have been more than sufficient to encourage the hybridiser to take the dogrose in hand with a view to the creation of new types. In the hybrid or Penzance briars we have not only large and effectively coloured flowers in association with the delightfully fragrant foliage, but a vigour far surpassing that of either of the parents.

Two other of the native roses accepted by Mr. Baker as true species, are the Scotch rose (Rosa spinosissima) and the Ayrshire rose (R. arvensis). In the first half of the present century some attention was given to the raising of varieties from these two species, and with much success; but during the second half but little or anything has been done to extend or improve the two sections. The Scotch roses form handsome bushes, and are useful for low hedges; while the varieties of R. arvensis comprise some of the very finest of our summer climbers, the best known being perhaps Bennett's Seedling, Dundee Rambler, and Ruga.

AMATEUR ROSARIAN.

The R.H.S. Social at Chiswick.—Probably arising out of the date of the Newcastle Show, where the R.H.S. council will attend as a deputation on the 13th inst., it had been found advisable to hold the now annual social gathering of the committees at Chiswick on Tuesday last. This is a very much earlier date than last year. Happily the gathering is this time held on a Tuesday. Last year, because of the numerous flower shows held on Wednesday, not a few of the most regular attendants at the committee meetings were shut out from the function. Probably the gathering was thus early fixed also in the hope of finding strawberries well in fruit. Strawberries, in spite of a grand bloom everywhere, seem to be unusually late this season, the fruits being very slow in swelling. This is particularly the case in the Kentish fields, but of course they are much earlier at Chiswick. But there the soil soon dries up, and unless ample water can be supplied there is reason to fear that a great crop may not after all result.—A. D.

THE CHINESE OR BENGAL ROSE.

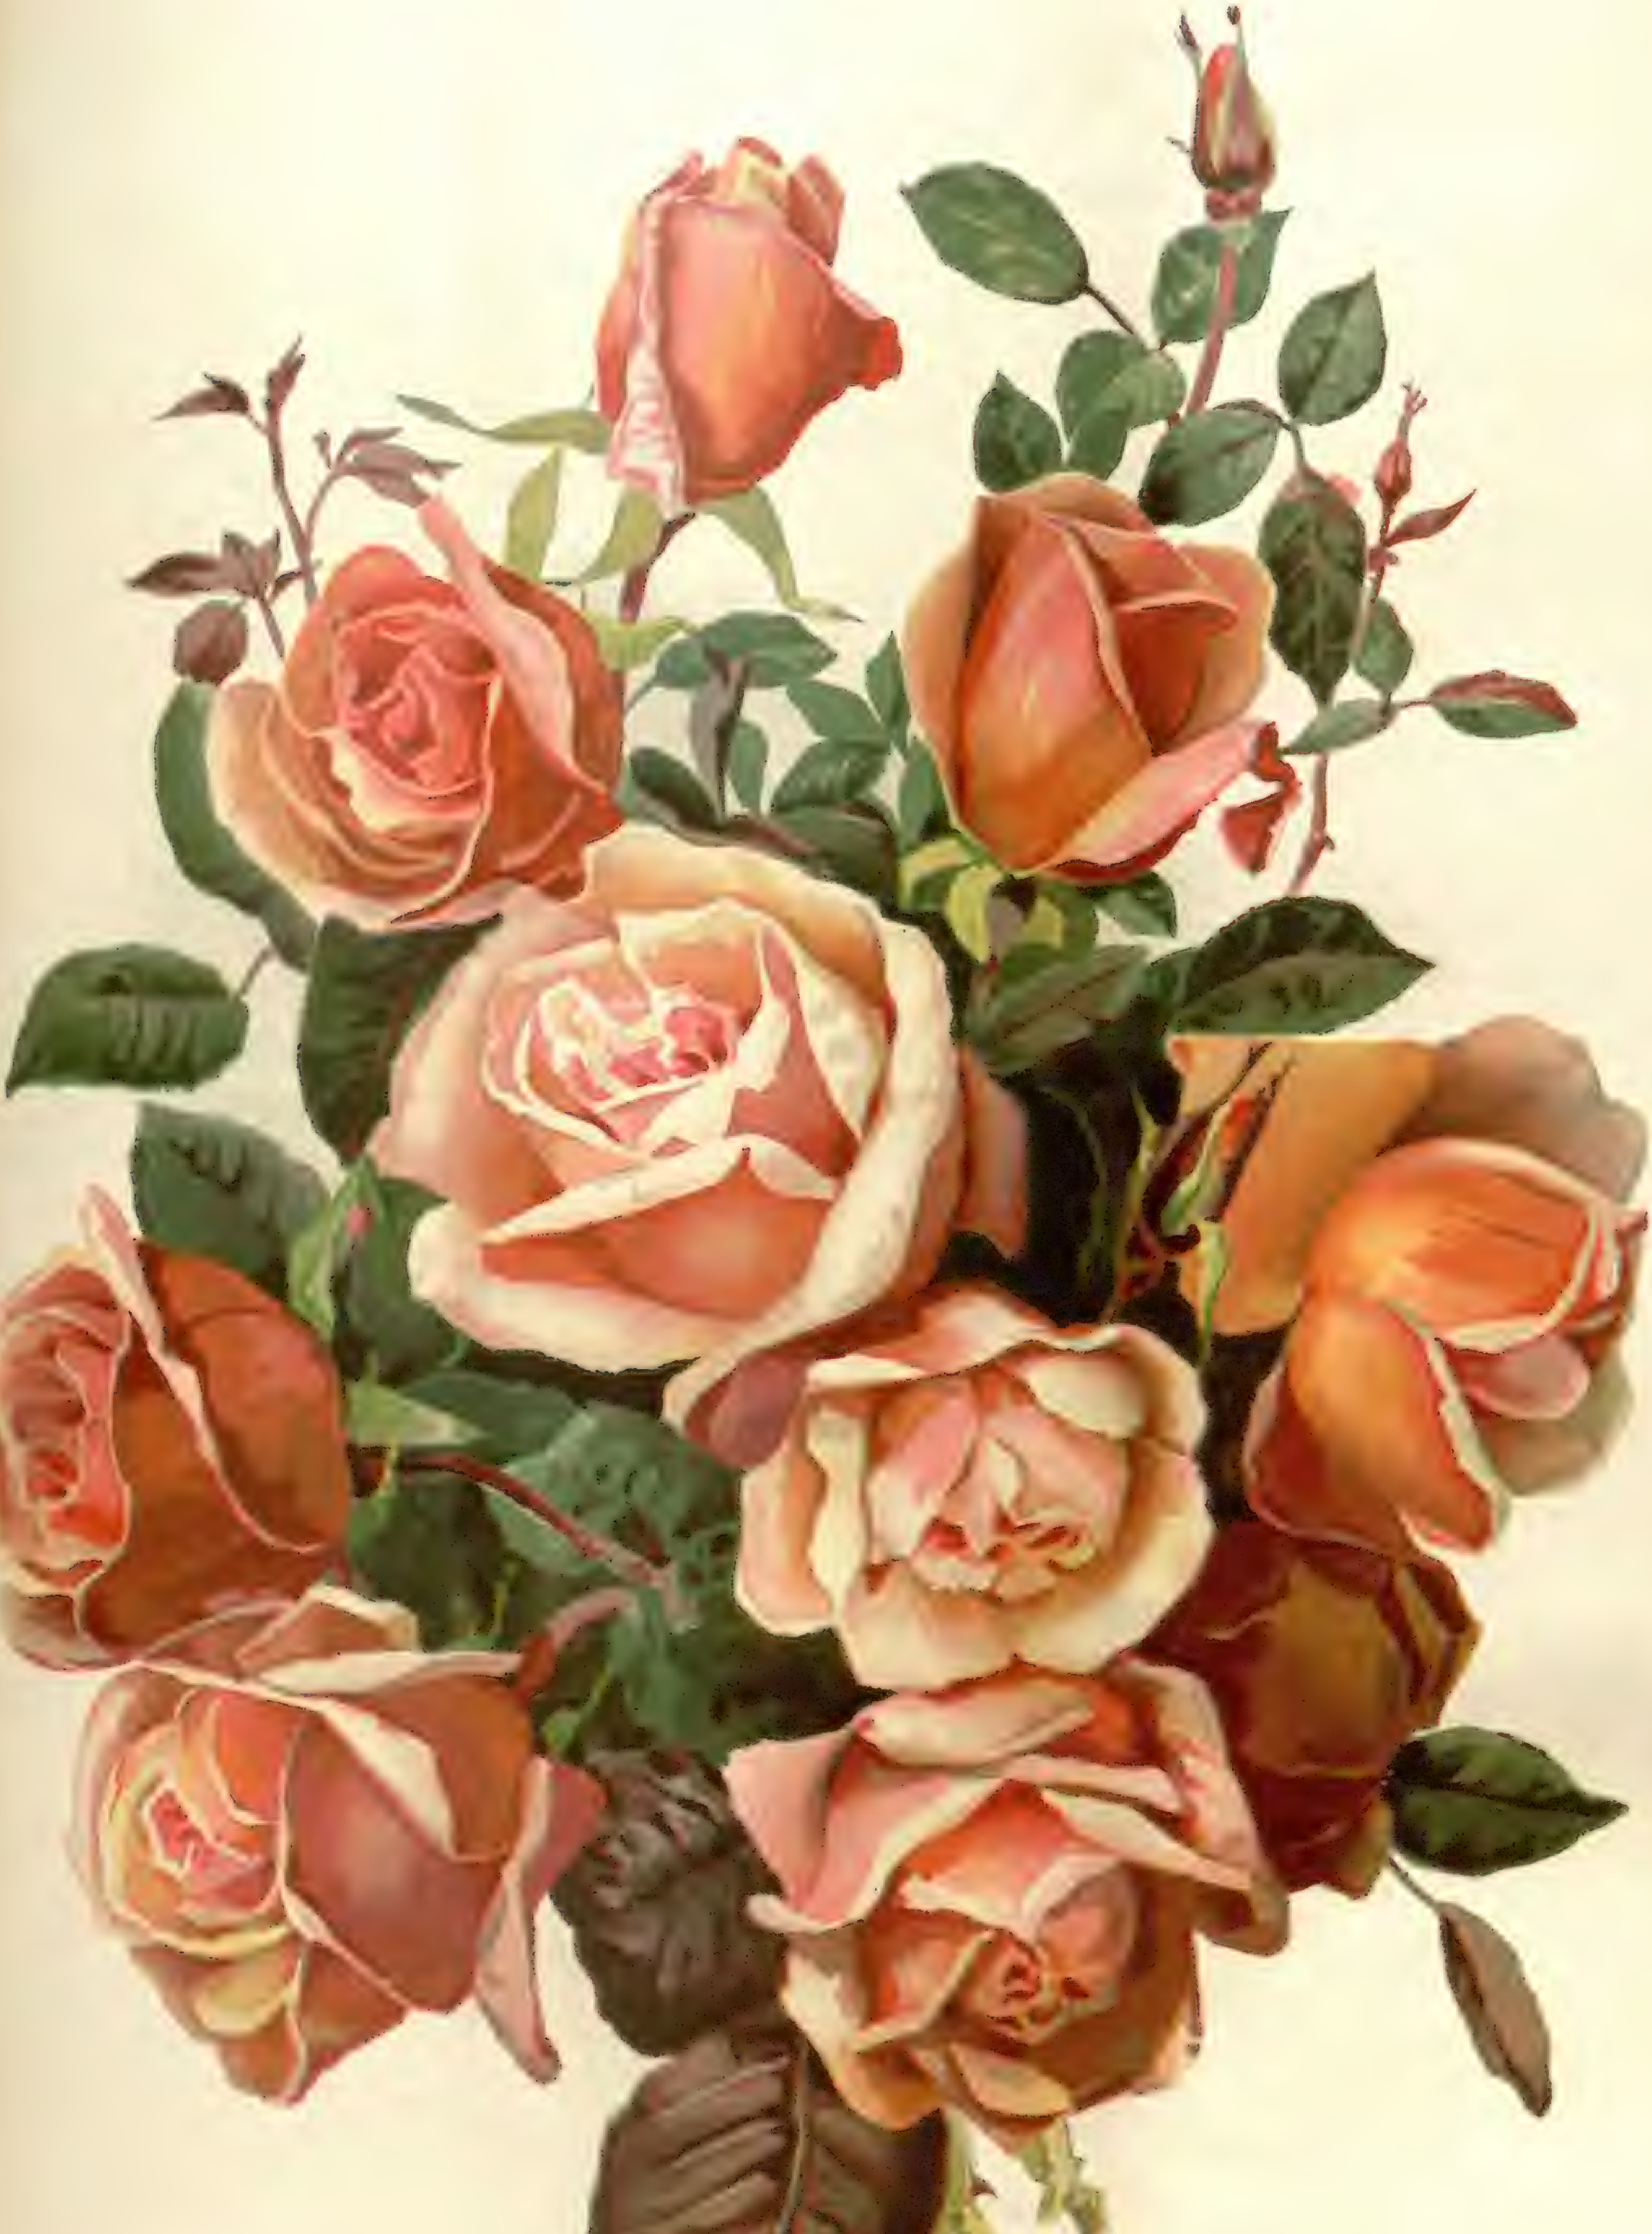
THE China rose may be said to form the central group of the species generally known botanically as *Rosa indica*. On the one side of it we have the summer-flowering kinds, which have originated by crossing it with the Gallica and other summer-flowering roses, a very popular class in former days, and of which there still remains in general cultivation, the delicate-hued Blairi No. 2, the rich and glowing crimson Chenedolé, and Vibert's pink and white Indica major, which is largely used as a stock in the South of Europe, and is still grown there for ornamental purposes, luxuriant hedges of it being commonly met with. On the other side we have the rich and magnificent autumnal-flowering classes known as the Tea-scented, Noisette, and Bourbon roses, which also owe their origin either wholly or in part to the China rose and its varieties. To botanists the species presents some difficulties, the first China roses introduced into this country having arrived towards the close of the last century in the form of garden varieties bearing double or semi-double flowers. Mr. Crépin, the eminent Belgian botanist, who has made a special study of the genus *Rosa*, states in one of his works that "the section of the *indicæ* is composed of forms whose specific delimitation is still very obscure, this being due to their all having been described in a primitive manner from plants which have been cultivated, and more or less profoundly modified, by long culture, not only in European gardens, but in those of China and Japan." Single-flowered China roses are in cultivation, but they appear to be of more recent origin, and, in common with single-flowered tea roses, I fear they cannot be generally cultivated, as they lack the first essential of a single rose, namely, absolute hardiness. At this nursery many seedlings have been thrown away on this account, although most attractive in the size and colours of the petals of the flowers.

ROSES IN THE HONG KONG BOTANIC GARDENS.

But whatever difficulties the China roses may present to the botanist, to the amateur horticulturist they are a source of unalloyed pleasure and delight, no other class of roses furnishing such a feast of flowers from early until late in the season, and from the humblest cottage garden to the noblest pleasure grounds in the country no roses are more in evidence.

The varieties of the China rose fall naturally into three divisions or groups, viz., the freer-growing section represented by the common blush China, the dwarf growing crimson China roses and their allied varieties, and the miniature or fairy roses named Lawrenceana roses, after an authoress who wrote on roses at the close of the last century. A very large number of varieties of China roses were extant in former years, but

THE GARDENERS' MAGAZINE, JULY 9TH, 1898.



NEW CHINA ROSE—QUEEN MAB.

from want of distinctness and hardiness, many of these have now disappeared from cultivation, and I shall content myself with mentioning a selection of the best kinds only which are now in fashion.

In the freer-growing section, the common blush China is still the most commonly met with, being valued for the profusion and persistency with which it produces its lovely pink blossoms from early summer until late in autumn. As a bedding rose it is unexcelled in its colour, and it is equally suited for forming small hedges, for planting against walls and buildings, and for introducing amongst mixed borders and shrubberies; In fact, it seems nowhere out of place in the garden. The colour of the cut blooms shows up well under electric or gas light, and in many large gardens this rose is being grown in large quantities expressly for cutting for dinner table decoration. Of recent years some new shades of colour have been introduced into this section by hybridising with the tea-scented varieties, and the subject of the coloured plate presented to the readers of the present issue, Queen Mab, is one of these, producing rich, rosy apricot flower, shaded with orange and violet. Mr. Guillot, of Lyons, has also given us two very beautiful kinds, viz., Madame Laurette Messimy, rose shaded with yellow; and Madame Eugène Resal, rich coppery rose, while a fourth variety, which like Queen Mab, originated at Waltham Cross, is Duke of York, which has been figured in the GARDENERS' MAGAZINE, producing variable flowers of rosy-red and white. All four of these roses when in full bloom, constitute a picture of loveliness. Queen Mab is especially fine in late summer and early autumn, when the cool and lengthening nights intensify the colour of the flowers. As light-coloured companions to these we may mention the white-flowered Ducher and the beautiful flesh-coloured Mrs. Bosanquet, the last-named a hybrid between a China and a Bourbon, and thus often classed with the Bourbon varieties. Other good kinds are Archduke Charles, rose changing to crimson; Madame Breon, rosy; Maria Sage, rose shaded flesh; and Napoleon, bright pink. The green-flowered rose (Viridiflora) also belong to this section, having probably originated in a sport from the common blush China. The so-called yellow China rose belongs to the tea-scented roses, and requires a greenhouse for its successful cultivation.

In the second division, comprising the crimson China roses and their allied variety, the richest shades of velvety crimson are to be found in Cramoisie Superieure, and the brightest tints in Fabvier. These are both fine bedding roses, and are two of the most beautiful gems of the rose garden, especially in autumn, when the warm tints of their manifold blossoms are conspicuous among the departing glories of the flower gardens. The old crimson china (Sanguinea) is also very rich in colour, but requires the protection of a wall or building to develop its full beauty. Fabvier forms a capital covering for the low front of a greenhouse wall with a southern aspect, and of Cramoisie Superieure there is a strong growing variety (James Sprunt) which will cover a considerable wall space in a favourable aspect. Other good varieties in this section are Abbé Merland (reddish-purple streaked with white); Alba (the white China rose, delicate), Eugène Beauharnais (amaranth, hardy and free), Louis Philippe (dark crimson, with paler edges), and Prince Charles (cherry colour).

The Fairy or Lawrenceana roses, which form the third division of the China roses, are a small but interesting group. The best of them is the Gloire de Lawrencias, with rosy-crimson flowers. They are beautiful pot plants for the greenhouse, but are not sufficiently hardy for general cultivation out of doors, and since the introduction of the dwarf-growing Polyantha roses, the Lawrenceana roses have gone out of fashion. Two other miniature China roses may be mentioned here, namely, Little Pet and Red Pet, producing respectively white and red flowers, and suitable for either outdoor or greenhouse cultivation.

The cultivation of the China roses presents no difficulties. They luxuriate in a rich soil of moderate consistency, light rather than heavy, but will grow in almost any soil. In pruning, also, they are equally accommodating, and may either be closely pruned or left almost untouched at the pleasure of their owner. The shortening of the shoots, however, improves the quality of the flowers, and as all the varieties are more or less susceptible to frost, there is generally some damaged wood to be cut away after the winter. At the advent of severe weather it is advisable to protect the heart of the plants. This is easily done by drawing some of the surrounding soil around them. If, then, the upper part of the plant be injured, it will break again in spring from the lower eyes. The smaller growing kinds of the crimson-flowered section are more delicate than the freer-growing class, and require more care in the event of the winter proving a sharp one. For pot culture the China roses are admirable, plants on their own roots growing and flowering well in small pots five and six inches in diameter. If the flower buds are pinched off during the summer months, and the plants kept growing under glass, they will produce a profusion of flowers during October, November, and December, the period of the year when it is most difficult to obtain roses, and when they are sure to be highly appreciated.

ARTHUR WILLIAM PAUL.

Paul's Royal Nurseries, Waltham Cross.

Cauliflowers and Broccolis.—I cannot endorse the opinion Mr. Henslow expressed recently at Chiswick that these two very important sections of the brassica family are practically identical, but owe their habits of heading in such diverse seasons as the summer and winter to the accident that one had been mainly produced in a climate that was warm during our winter and the other in a climate that was the reverse. I cannot hold, however pleasing as a theory, that such an opinion is in accord with practical experience. Vegetation or plant life is so much influenced by its environment that any variations found resulting from growth in diverse climates or seasons would disappear absolutely when grown in the same climate and country constantly. Gardeners recognise that the cauliflower is tender and an annual, for it will head in flower and seed the same season. No broccoli does that; indeed, every variety is a perennial, and, as compared with the cauliflowers, hardy. The nearest approximation of the two is found in Veitch's Self Protecting.—A. D.

ROSES IN HONG KONG.

THE Botanic Gardens, Hong Kong, are situated on the side of a hill three or four hundred feet above sea level, from whence splendid views of the harbour and the mainland of China may be had. The gardens are laid out in terraces and slopes, and the accompanying photograph illustrates a part of the rose terrace with the roses in flower. It was taken in February of the present year, as at that time the plants are at their best. After many trials it has been found that there is one variety which is more useful and flowers much better than any other. This particular variety is the Safrano, a charming tea, well known in England, and the majority of the plants shown in the illustration belong to it. Several attempts have been made to grow hybrid perpetuals, but with indifferent success as regards flowers. They grow well enough, and make good strong shoots, but seldom, if ever, flower. China monthlies do splendidly, and furnish an abundance of bloom during the winter months. The Banksian grows and flowers very freely, and so does also a little pink cluster rose, the name of which I do not know, but something after the style of Crimson Rambler. We have it trained against wire fences, and when in flower it is one mass of bloom. Gloire de Dijon, although a free bloomer in England, and easy to grow as well, is very different with us. It makes plenty of wood, but produces few flowers. Souvenir d'un Ami is a first-rate variety for pots if kept out of the summer rains; it grows well and flowers freely. When planted out, however, it is scarcely worth growing.

Our summer is the principal cause of roses doing badly, as the heat, rain, and typhoons are more than the plants can fight against. From May until October it is one long struggle for the plants to keep alive, and it is surprising that we have not more losses among them than we have. The temperature during this period varies from 85 degrees F. to 94 degrees F. in the shade during the day, and from 80 degrees F. to 85 degrees F. at night. Most of the rainfall occurs during this season, too, the average amount per annum being over ninety inches. I have seen as much as twelve inches fall in one day, and twenty-four inches in four consecutive days. Circular storms, or typhoons, as they are called in the Far East, are one of the greatest drawbacks to horticulture and arboriculture in the colony. Rose bushes, shrubs, and trees are uprooted by the hundred when we get the full force of one of these storms. During my residence of six years in Hong Kong two of these storms of exceptional severity swept over the island, besides many others of less force. The two to which I refer were, one in October, 1894, and the other in July, 1896. In the photograph may be seen a tree of Heteropanax fragrans on the far left hand corner of the rose square. There were three of these standing near the rose beds previous to the typhoon of October, 1894, but only one remained, and that one badly damaged, after the storm was over. The two araucarias on the far side, which may be easily recognised, as they are taller than any of the other trees, had nearly all their branches stripped off at the same time, and in the photograph show the new branches made since.

We make up new beds of roses in the autumn, so that the plants may have the benefit of the whole cool season. If they were planted in the spring I do not suppose that one out of a hundred would live through the summer, as they would not have time to become established before the warm weather set in. I should have mentioned that all our young stuff is grown in pots and on their own roots. By this method we can keep them more under control during the rainy season better than if they were grown in the open ground. We increase our stock by layering and cuttings. The layering is done in the autumn and cuttings put in in December or January. The soil in the Botanic Gardens is very poor except where the beds have been made up from soil obtained from the hills. Most of the soil, in fact, is nothing but decomposed granite, and were it not for the fact that we can get plenty of stable manure rose growing, and, for the matter of that, horticulture in general, would be very uphill work in Hong Kong. As it is, we generally manage to have a very good show of roses and other things in their season, on the "barren rock," as some geographers are pleased to term the island. Rose pruning is done in the autumn, and a good dressing of manure given to the plants annually. Insects trouble us very little; we get an attack of green-fly sometimes, but nothing very serious so far as the roses are concerned.

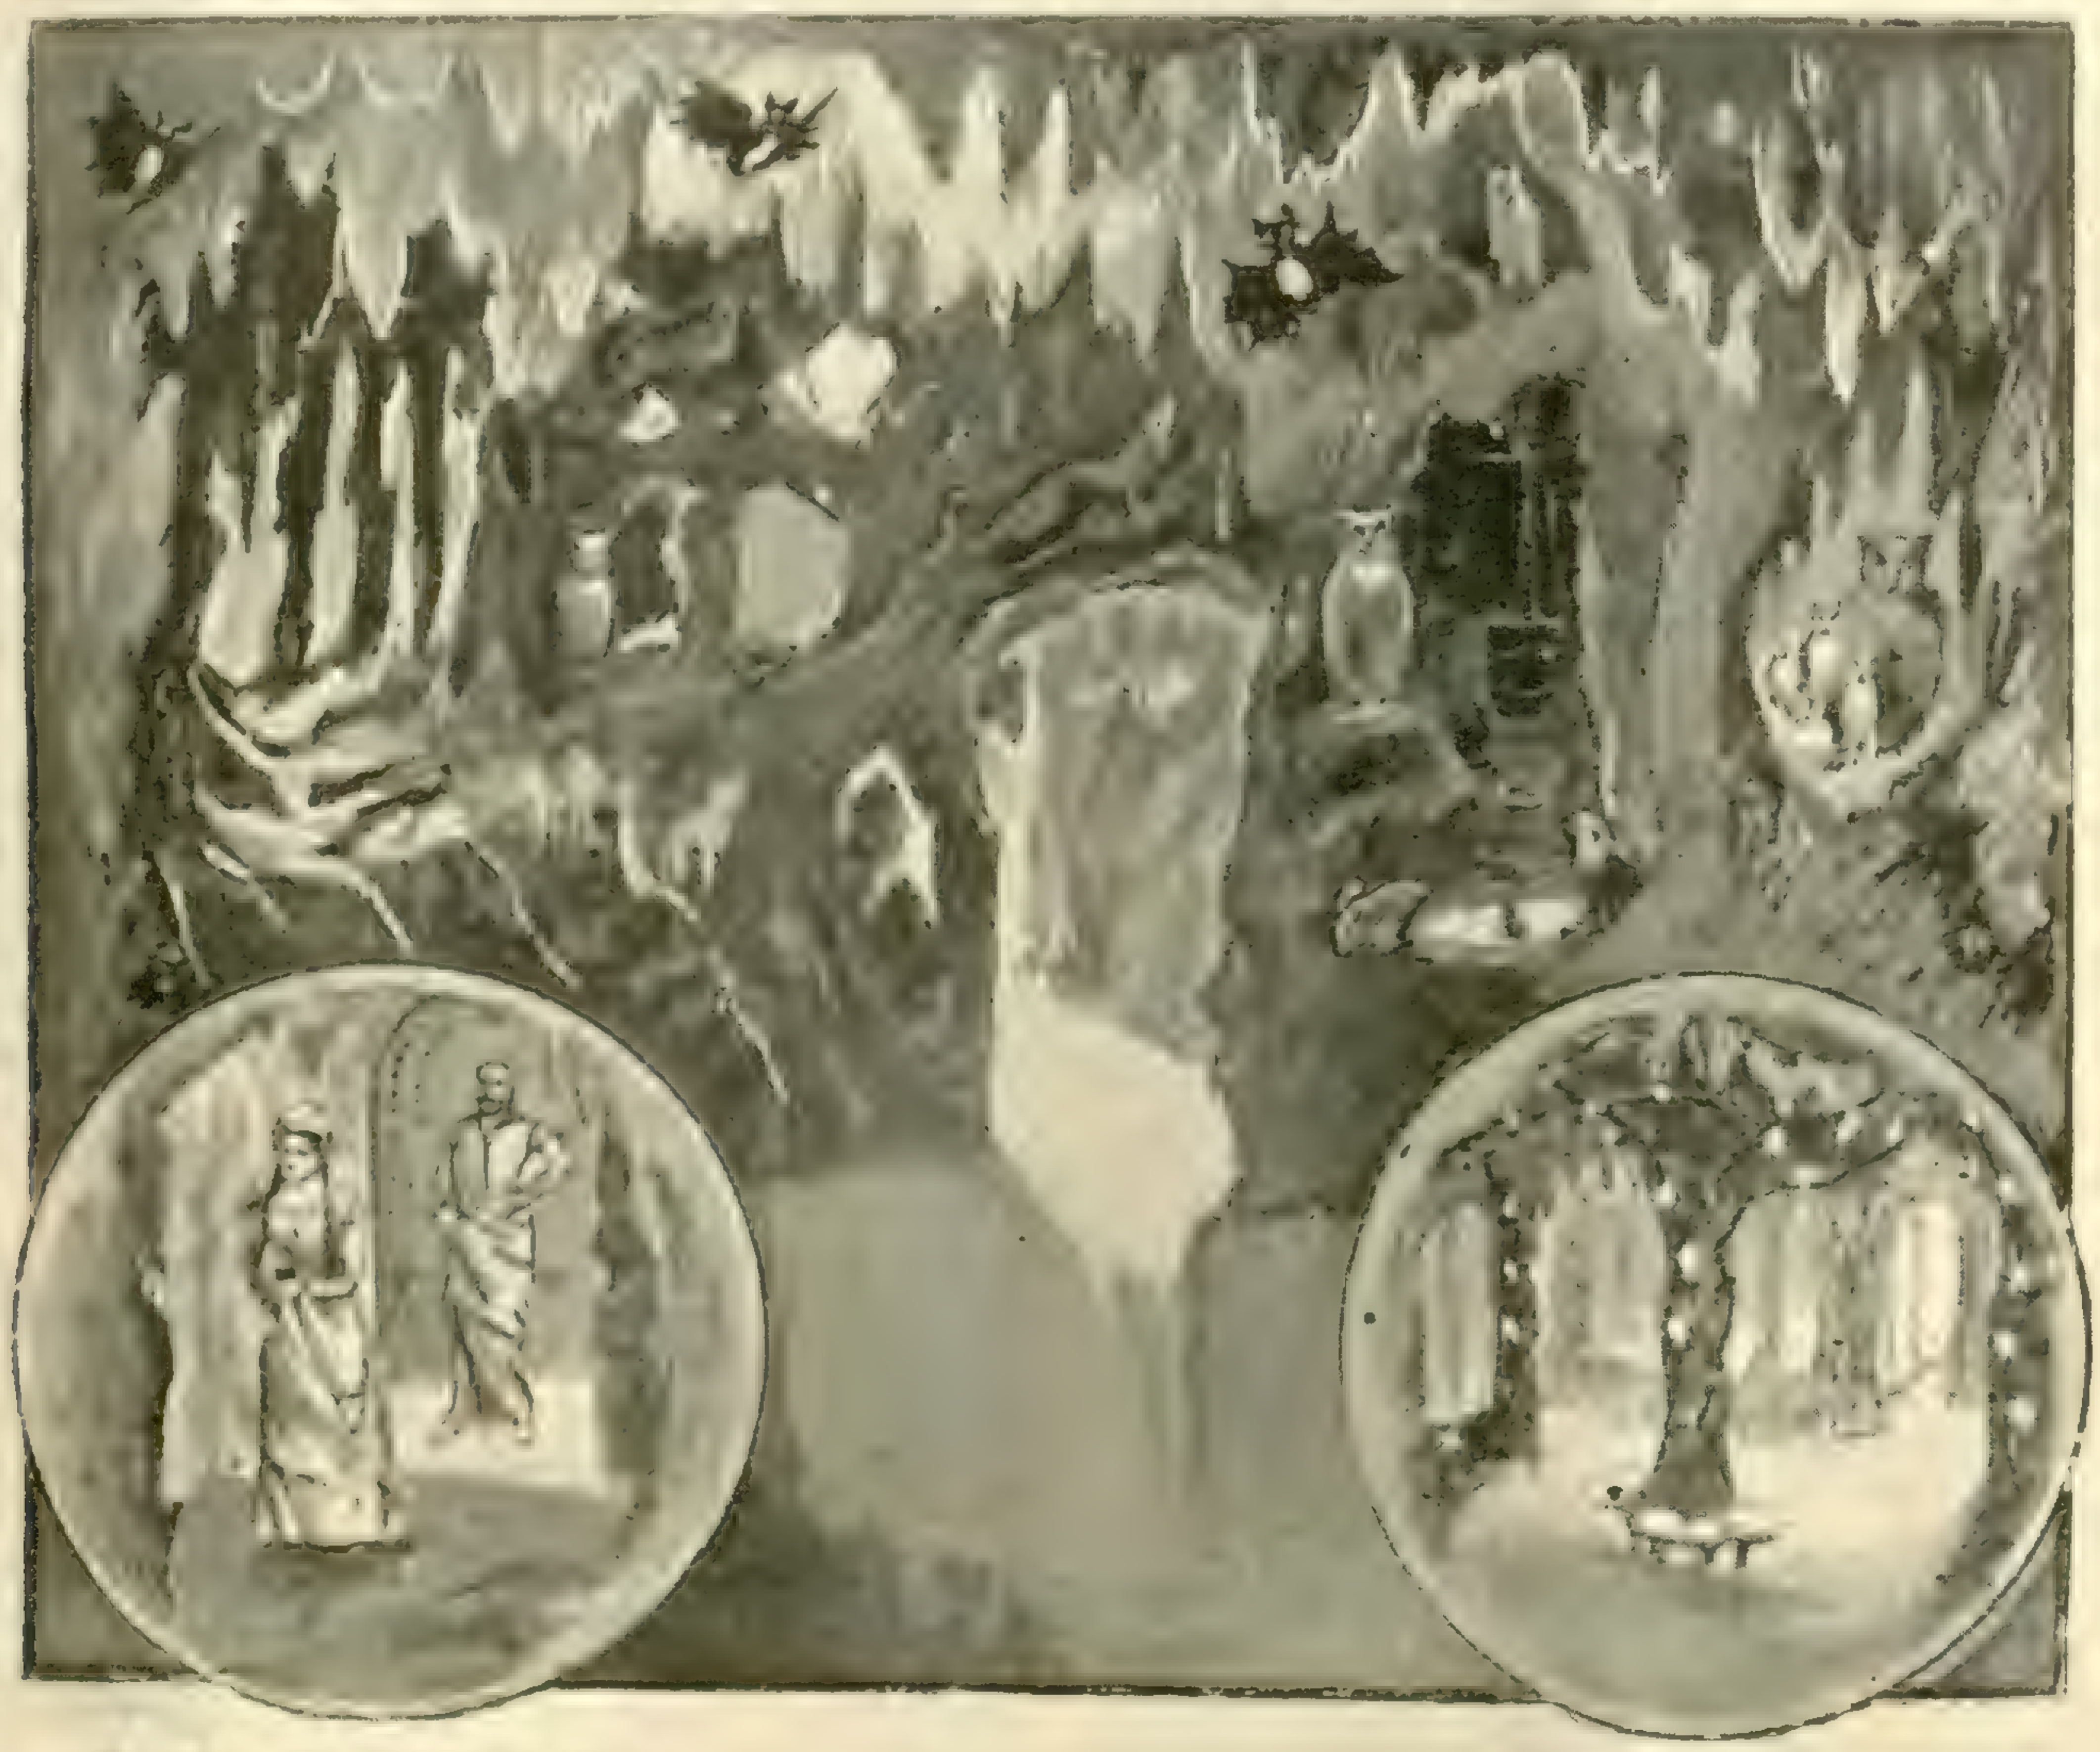
The winter season being the dry season, necessitates a considerable amount of watering on our part. Formerly this was a serious consideration, as our service was connected with the town supply, and often we could not get a drop of water. A year or two ago this was remedied, and now we have our own supply, independent of the town and everything else, so that we have sufficient for all our requirements. The Chinese market gardeners are great rose growers. Large quantities are brought into the market every day during the season to meet the demand of the Europeans. The variety they grow principally is the same as the one grown by us, viz., Saffrano. Most of them are grown on the mainland, in British Kowloon, where there are several large rose gardens. As launches are running constantly between Hong Kong and Kowloon, and *vice versa*, the growers have no difficulty in getting their flowers into the market.

Before drawing my remarks to a close, I should like to say a word about an indigenous species, Rosa sinica. This is a magnificent thing, with white flowers three to four inches in diameter, of a rambling habit, and a first-rate thing for a trellis or for trailing over huge rockwork. When I was at Lantao, an island a few miles from Hong Kong, two or three years ago, I saw hundreds of these plants with thousands of blooms open on them, and it was the finest show of roses that I had ever beheld.

Botanic Gardens, Hong Kong. W. J. TUTCHER.

FRIAR PARK, HENLEY-ON-THAMES.

THE varied and beautiful surroundings of Henley-on-Thames have been so frequently and fully described, especially in connexion with the annual aquatic pageant, and have also been enjoyed by such large numbers of people, that no attempt to detail the charms of wooded hills, limpid water, broad meadows, pretty boat houses, and lovely gardens, extending to the water's edge, need here be made. Those who know Henley, whether as visitor, by residence, or by reputation, will readily understand that any establishment at this prettily-situated Oxfordshire market town must, as a matter of course, possess a large amount of beauty and interest by reason of its environment. Friar Park, Henley, the country residence of Frank Crisp, Esq., has all that one could wish for in the matter of beautiful surroundings, and, in addition, the estate has been laid out in a most artistic manner by Mr. H. Milner, and is now fast developing into one of the most enjoyable, interesting, and wonderful of gardens. The entrance to Friar Park is a little over half a mile from Henley railway station, and just inside the entrance gates is the house of Mr. P. O. Knowles, who is both steward and gardener to Mr. Crisp. A broad drive sweeps round and upward to the imposing mansion, which is a handsome building of stone and brick, finely decorated with carved stone. Monks or friars of all ages are represented in stone on many parts of the building; one scans the heavens through a telescope, another, over the kitchen door, is busy provisioning, while a third reminds one of the comfortable "Friar of Orders Grey." The style of the mansion may well be described as light ecclesiastical. Along the extended east front of the mansion is a broad terrace, and from here a most beautiful view is obtained, extending to the Quarry Woods and distant Chiltern Hills on the left, and to Marsh Lock low down on the right just beyond a pretty sweep of the silvery, winding Thames. Nearer home the course of the river is indicated by the sloping banks of trees, into which the lower part of the estate merges in a most natural manner. In the foreground is a lake surrounded by spreading greensward that reaches right up to the formal Dutch garden just below the terrace. Small wonder, with such a garden and charming surroundings, that seem part and parcel of the estate, Mr. Crisp loves his country home, and is ever making such alterations and additions as shall render it ever more interesting and beautiful.



Faust and Marguerite. Vine Chamber.

WISHING WELL CAVE AT FRIAR PARK, HENLEY.

The establishment is comparatively a new one, for is but eleven years old, consequently very many of the trees are still youthful, though this is not too apparent, because where effect was wanted a large number of trees were planted together on rising ground. Very noticeable are the large and healthy masses of the best rhododendrons seen on either side of the drive, and also the large groups of evergreen trees and shrubs, chiefly conifers, that are placed informally at suitable points. Golden yews, indeed brightly-coloured trees and shrubs of all kinds are extensively grown, and nowhere could they be in better condition considering their age; the colour of the golden yews, retinosporas, and Juniperus canadensis aurea—a grand specimen, is now most brilliant and effective. As a foil to the brighter colours there are plenty of spruce and Scotch fir, Cedrus Deodara, C. atlantica, Abies Douglasi, A. Nordmanniana, and Lawson's and other cypresses, all in good condition and making the best use of their time. All being well, Friar Park will be much more beautiful in from five to ten years' time, when the trees and shrubs have increased in size and produced in a more marked degree than now those effects for which they were planted. From boundary to boundary every part of Friar Park is full of interest, and scarcely another establishment of sixty acres contains so many attractions. The Rock Garden is one of the finest in the British Isles; the caves and caverns, with their many wonders, are remarkable constructions; the Pinetum needs only a course of years to bring it into prominence; the Old English Garden, with its clipped trees is quaint and curious; the maze is well planned; the combined herbaceous and rose garden is ample, and contains the best of everything; the kitchen garden is broad and well cropped; and the glass department of twenty houses contains abundance of choice fruits and flowers.

To a hilly or mountainous country, caves and caverns form a natural accompaniment, and so at Friar Park, the series of subterranean caverns constructed under a part of the rockery and extending right up to the mansion, form one of the most interesting features. Two entrances to the caverns are from the rock; one of these is where mountain passes lead you unconsciously to a dark recess, under what is a clever imitation of a natural bridge, with rustic railing. A sliding iron door that is scarcely distinguishable from the rockwork, admits one to what are probably the most wonderful underground chambers that have yet been produced artificially. The first cave is known as the Vine Cave, for over the root clambers a clever representation of a vine worked out, so far as the stem and branches are concerned, in some wonderful composition of cement and iron; the leaves are very truthful, while the bunches of fruit are represented by clusters of berries made of glass, the bunches varying in colour. Inside each bunch is an electric light, and when the lights are turned on the effect of the cool colours upon the stalactite and stalagmite formations produced largely in tufa, is one that is not easily described. Passing along the passages, under arches and round columns that have the most natural appearance possible, another broad chamber opens out and is supported by big, irregular masses of tufa put together in such close imitation of what one might expect in some of the Derbyshire caves, that one is bound to appreciate the cleverness of Mr. T. B. Harpham, of Church Street, Edgware Road, who planned, designed, and carried out the whole series of underground chambers for which Friar Park is becoming famous. The accompanying illustration represents a part of the Wishing Well cave, and is one of the most skilful bits that Mr. Harpham has executed. Mirrors set at various angles reflect one's image in a most alarming manner, and also afford you an opportunity of seeing round the corner without the trouble of going there. These mirrors are so set that you are deceived at all points, and though the caves are very extensive their extent is apparently quadrupled, and without a guide it would be a most difficult matter to find one's way out from either of the large chambers. In the Wishing Well you may have a glance at the face of your future wife or husband as the case may be, and how Mr. Harpham ingeniously does the business it would be scarcely fair to say. The light in this chamber is provided by electricity—indeed, this is the lighting power throughout—

and the bodies of finely-executed hammered-copper bats serve to hold the light-giving coil, so that a most grotesque effect is produced; owls and [illegible], toads and elfs add to the grotesqueness of the scene and increase your wonderment. The West Chamber contains some optical illusions: a bowl of gold fishes suddenly appears in a glass you had imagined was a queer sort of mirror, and then sometimes quickly and sometimes slowly a monkey is substituted for the fishes, or, perhaps, your guide's head appears, and you wonder where his body has disappeared; the illusion is simple; it consists of the objects you saw, some mirrors, and electric lights, not forgetting Mr. Harpham. In one small recess is a clever representation of Marguerite nearing the church door, with Faust following admiringly a short distance behind. The figure—for it is but one—is three-quarter life size; Marquerite faces you, but the back of the figure is moulded as Faust, and faces a mirror cleverly set, so that the illusion is most complete. From close to the drawing-room there is an entrance to the caves, and besides the entrance on the rockery there is another close to the greenhouses. The subterranean passages and chambers are heated by hot water when necessary, but at this season of the year they provide a deliciously cool and well ventilated retreat whenever the sun condescends to remind us that this is summer time.

THE LAKE AT FRIAR PARK, HENLEY.

Already the lake has been referred to, and it is certainly a most delightful piece of water, [illegible] in outline, prettily planted about at various points, and with a little island that is exactly in the right place. It is difficult to imagine the grounds of Friar Park without the lake, and yet it has been produced artificially where once was a small private house and [illegible] meadow. The house was pulled down, and Messrs. Pulham and Son, of Finsbury Square and Broxbourne, were called in, with the result that these magicians in all that pertains to water scenery combined with rockwork, transformed the face of the land, made a waterfall of the wonderful Pulhamite, and conducted the water into a lake that looks as if it had existed here since the [illegible] ancient of days. Prehistoric times, did I say? Well, why not? Look at these sand stones that form a natural path across the end of the lake: they tell quite a little tale. Perhaps the time was when our ancestors had to kill and skin the bear to obtain clothing. Father, mother, and two bairns were crossing the lake, homeward bound from the woods above, when suddenly an [illegible] and hungry Bruin follows hard after them. Mother and bairns scurry off over the stones, jumping briskly from one to the other over the water, but Pa turns about and faces the bear, and, to use a common phrase, makes him "sit up," for on the then (?) soft sandstone are the now hardened marks of Bruin's hind feet and haunches, where he drew up for the fight. If this is not a sermon in stone it is certainly a story.

Trees of various kinds suitable for water margins have been planted [illegible] around the lake; bamboos will soon be things of beauty, as the ones in the little bog garden now are. A group of eucalypti in a warm spot have passed the winter unharmed, and close by Mr. Knowles has planted a pretty collection of choice hardy ferns among the Pulhamite rockwork that extends below the waterfall.

The rock garden is situated on the north side of the mansion, and is in every respect a fine piece of work. It is constructed in a most natural manner having a central valley with two small pools of water, surrounded by mountains of various heights, the highest being probably forty feet above the lowest point in the garden. This garden was not all constructed at one period, but the part nearest the mansion is the oldest, and represents the skilful manner in which Messrs. Backhouse and Son, of York, design and lay out such gardens; this is of considerable extent, and planted with popular alpines, and also a large number of extremely choice subjects. A most natural effect is produced by the suggestion of a pass along one of the higher portions, and also by the tiny green lawn which, together with an elongated pool, make up the little valley. All around are fine patches of the purple Thymus serpyllus, blue Campanula garganica, and lovely golden areas of sedum, with saxifragas of varied form and hue clustering in rocky crevices, or perching perkily at the top of some boulder. Throughout the whole of this magnificent rock garden the saxifragas and sedums are very evident, both as regards their happy condition and the number of species, varieties, and hybrids. Campanulas are plentiful, and many are just now in perfection, while ramondias, edelweiss, hardy orchids, rock-loving ferns, tiny pines, abies, and junipers occupy positions such as they love, and are now large enough to give these miniature alps a clothed and natural appearance. It is frequently a fault in rock gardens that the spaces or pockets left for the plants are most inadequate, and do not hold sufficient soil to properly support them; such a state of affairs does not, however, exist at the Friar Park Alps, and everything that has become established is flowering, has flowered, or promises to flower with the utmost freedom, while the more recently planted subjects are encouraged by the prevailing conditions to make themselves at home as soon as possible. Gentiana acaulis, a sweetly pretty plant when in flower, but one that refuses to grow satisfactorily in many gardens, is here—like G. verna—represented by a mass of several square yards, which must have been a grand sight when covered with intense blue blossoms. Quite a casual look round reveals the fact that here is a grand collection of rock plants, and in many cases these are represented by immense masses. Primulas, androsaces, Antennaria tomentosa, dwarf spiræas, Daphne Cneorum, aubrietias in all the best species and varieties, herbaceous phloxes, achilleas, anemones—such as A. Robinsoniana, A. sylvestris, A. vernalis and A. montana, Arnebia echioides, Aster alpinus in several varieties, Atragene alpina, Cypripedium spectabile, C. calceolus, hepaticas, yellow, gold and white brooms, drabas, dianthuses, veronicas, &c., &c., were a few of the subjects noted as being exceptionally good

VIEW IN THE ROCK GARDEN AT FRIAR PARK, HENLEY.

In years to come there will be a first-rate example of the old English garden, with its fancifully-clipped trees, at Friar Park, and already there are numerous beds in this curiously-designed parterre. The standard retenosporas worked on thick stems of Cupressus Lawsoniana are fine specimens. There are peacocks and pyramids, ovals, columns, and many other shapes in yews, cypress, and thuias, but as yet the specimens are young, and the garden is not completely planted. Golden privets are also to be prominent here, and in many shapes. The rhododendron dell is situated on one side of a deep hollow, and along this slope a path winds backward and forward, falling at each turn until the bottom of the hollow is reached. The rhododendrons are planted on either side of the walk, so that a continuous scene is presented to the pedestrian, and he can examine any one of the fine bushes at leisure, or a fine view of the whole garden as a mass can be obtained from above or below.

One might continue writing for a long time without exhausting the interest of Friar Park, but already I have exceeded the limits of space prescribed, and so conclude this notice by stating that the ample kitchen garden is well cropped, and the young fruit trees are everywhere looking well. The twenty or so of glasshouses erected by Messrs. Crompton and Fawkes, Chelmsford, contain large supplies of grapes, peaches, nectarines and figs, all in first-rate condition, and testifying to the care and skill of Mr. Knowles. There are also gorgeous displays of calceolarias, every plant a picture, and gloxinias of the very best forms, some specimens —now past their best—measuring two feet across. Other flowering plants and foliage subjects for decorating are equally well managed, and there are the foundations of good collections of both orchids and cacti.

Friar Park has a great future as a famous horticultural establishment, and it is earnestly hoped that the present proprietor, F. Crisp, Esq., will long live to enjoy his country home, and that his able steward, Mr. Knowles, may long continue to enjoy the support and goodwill of his present generous employer. One word more; Friar Park is open to the public one day a week; admission sixpence. Half the proceeds go to the Gardeners' Royal Benevolent Institution, and the other half to the Mayor of Henley to be distributed among the various local charities.

C. H. CURTIS.

ROSES IN THE NORTH OF SCOTLAND.

IN Scotland this year the rose growers have had a rather peculiar experience, in so far as the season promises to be a late one, notwithstanding the fact that the first four months of the year were much warmer than the average. In May, though we had here a low temperature, we never experienced more than four degrees of frost, and not so much as that in June. The May rains have, in connection with the previous warmth, induced such a strong, vigorous growth that it rendered us quite unable to compete at any show during the week of the National Rose Society's Crystal Palace Exhibition. I feel sure the blooms will be magnificent after the middle of July, and I append a list of the dates of first blooms here, to show the effects of this season, as compared with others:—

1893	Maiden plants	June 7	Distinction.
1893	Cutbacks	May 30	Rubens.
1894	Maiden plants	June 15	Marie Van Houtte.
1894	Cutbacks	June 6	Rubens.
1895	Maiden plants	June 4	Grace Darling.
1895	Cutbacks	June 10	Rubens.
1896	Maiden plants	June 1	Gloire de Dijon.
1896	Cutbacks	May 26	Grace Darling.
1897	Maiden plants	June 25	Grace Darling.
1897	Cutbacks	June 9	Bardou Job.
1898	Maiden plants	June 15	Bardou Job.
1898	Cutbacks	June 7	Bardou Job.

It will be noticed from the varieties that are named above that teas and hybrid teas are invariably the earliest to flower, and, I may add, also the latest. We find that they are quite as hardy as the hybrid perpetuals, and much freer in blooming, and are the favourite class in this district. Some seasons we have had twelve degrees of frost during the third week in May, and in some winters the thermometer registers below zero, and though entirely unprotected, still these roses live and subsequently grow and flower abundantly. This year they are exceptionally strong, many of our dwarf teas having on June 28 shoots over two feet long, and all with strong flower buds, which checked the shoot growth weeks ago.

We rather like a cool season here, as it suits hybrid perpetuals so much better than a hot one. Taking 1897 as an example, we had here what we considered the finest quality of roses we had ever seen, with such a wonderful substance in the petals, accompanied with richness of colour as will linger long in the memory of all who saw them. From the middle of July until the middle of August was the time of their greatest beauty, and this year we are looking forward to an equal if not a greater feast of beauty. The teas are stronger and more robust than usual, though, owing to the perversities of the month of May, we will not be able to compete until the second week in July, whereas two years ago we could show strongly on June 24. In 1897 we gained sixty-six first prizes, frequently beating most of the large growers in the United Kingdom. This fact will give your readers a better idea of the quality of roses produced in the north of Scotland than any other arguments I could bring forward.

JAMES SIMPSON (Messrs. D. and W. Croll).
Dalhousie Nursery, Broughty Ferry, N.B.

AMONG THE COLCHESTER ROSES.

ALTHOUGH Colchester is regarded by a considerable proportion of those who are acquainted with East Anglia as simply a flourishing commercial town, it is rich in interest apart altogether from its business aspect, and has strong claims upon the student of history or archæology, and upon those whose taste has been sufficiently educated to fully appreciate the delicate flavour of the succulent bivalve which is reared with so much success in the Colne. It was on the site of the present borough that the Emperor Claudius, in the year 44, established the first Roman colony founded in Great Britain, and we have other evidence of the historical importance of the town in the Norman keep of the once famous castle, considered to be the finest Norman keep in the United Kingdom, and in the ruins of St. Botolph's Priory and St. John's Abbey, and in the many objects of interest in the Museum, that remind us of the important events in the history of the borough, and of the many changes that have taken place in the habits of the burgesses since the great Roman Emperor made his triumphant entry eighteen and a half centuries ago. Colchester still possesses further interest, more especially for horticulturists, for it has become what has been aptly described as the metropolis of rose growing, and the great industry that has been created within and on the boundary of the borough has probably done more to make its name a household word throughout the United Kingdom than the stirring events in its history.

It was certainly not for the purpose of studying its history or archæological features or for becoming acquainted with the details of oyster culture which is carried on with so much success, that with the aid of the splendid service of trains provided by the Great Eastern Railway I made a flying visit to Colchester. Rather was it to have a run through, not for the first time, the rose gardens from which are obtained so large a proportion of the winning collections contributed to the principal competitive gatherings. On this occasion I had the advantage of the company of that distinguished amateur rosarian, O. G. Orpen, Esq., who, in extending a hearty invitation, undertook not only to show me what he is doing with so much success at West Bergholt, but kindly offered to act as guide in visiting the trade establishment wholly devoted to the production of roses and rose plants. That the offer of guidance was gladly accepted goes without saying, for in the first place the pleasure of the drive through the rose-growing district is greatly enhanced by having the company of a kindred spirit, and in the second a knowledge of the topography rendered it possible to cover more ground in the time at my disposal than would otherwise have been possible. Moreover, with the assistance of a rosarian so observant and skilful, it was possible to obtain a clearer conception of the conditions affecting rose culture that obtain in the district than would otherwise have been possible, and I readily acknowledge the value of the service so kindly rendered. In the course of my experience of rose exhibitions, I have heard many conjectures as to the cause of the success achieved by the Colchester roses. Some have attributed the success wholly to the soil, others to the climate, while a third section of rosarians have regarded skill as the chief factor. I have not been disposed to accept either the soil, the climate, or skill as the sole cause, for I have long known that there has been more than one, and with the fuller knowledge I now possess, I have no doubt that the splendid development of the flowers is the result of high-class cultural skill being combined with a splendid soil, and an eminently favourable climate. Mr. Orpen's garden and the several rose nurseries are situate on the high ground some distance to the north of the railway station, and as the district is within the influence of the strong air of the North Sea, the atmosphere is pure and the air decidedly bracing. The climatic conditions are indeed highly favourable to the production of stout, short-jointed, and well ripened wood, which may be described as the foundation of finely developed blooms. The soil is somewhat variable, but everywhere more or less favourable to the growth of roses. The soil of Mr. Orpen's garden is decidedly light, and while it enables him to devote his leisure with so much success in the development of the potentialities of tea roses, it is not strong enough to admit of his growing the hybrid perpetuals to the highest degree of perfection. The soil of the nurseries of Messrs. B. R. Cant, Messrs. Frank Cant and Co., and Messrs. D. Prior and Son appear to vary somewhat, but as proved to demonstration, it is throughout sufficiently substantial to insure, with the aid of moderate applications of manure, a vigorous growth and flowers of high quality. It has also the advantage of being friable and well drained, two conditions eminently favourable to the production of an abundance of fibrous roots, so essential to the success of the plants when transferred to the gardens in which they find a permanent home.

Mr. Orpen's Garden.

Mr. Orpen's residence is situated on the high ground at West Bergholt, some two miles to the north of the railway station, and commands one of the most beautiful prospects in the eastern counties. It might indeed be said of the site of the house and garden that "the beauty of the surrounding scenery, its gentle declivities, its luxuriant meadows, sprinkled with flocks and herds, its well-cultivated uplands, its woods and rivers, with numerous scattered villages and churches, farms and picturesque cottages, impart to this particular spot an amenity and elegance hardly anywhere else to be found." We have an indication of the taste Mr. and Mrs. Orpen have for roses in the border which [illegible] the carriage drive, and in the huge specimen of Fortune's Yellow which spreads over a considerable amount of wall space [illegible] their residence to the height of some twenty feet, and produces its attractively-coloured flowers in due season. These plants are of interest as a foretaste of the feast of roses grown elsewhere, and it may be of interest to mention that, although Mr. Orpen has specially distinguished himself in the cultivation of the tea-scented varieties, he does not limit his enjoyment to their charms, but grows [illegible]

THE GOOD DIE YOUNG.—Unlike most popular sayings, this has very little truth in it. Experience every day proves that some at least of the good are spared to make the world brighter and better, and a more pleasant place to live in. In fact, our experience is that good people, and good things generally, live the longest. For example, consider the thousands of articles which have been widely advertised and are now forgotten. Why? Because they were bad. On the other hand, we have Holloway's Pills and Ointment, which have proved the faithful friend of poor humanity for fifty years and more. Why? Because they are good. Of a truth, that which is good does not die, but lives for all time.—[ADVT.]

representative collection, and fully appreciates the distinctive beauty of each of the sections. Although my visit was made a few days previous to the competition for the National Rose Society's tea trophy, which Mr. Orpen has held during the three past years, he did not proceed direct to the quarters devoted to the teas, but made a detour to show me the enclosure set apart to the free-growing varieties popularly known as garden roses. In these Mr. Orpen takes much interest, and it is not surprising he should do so, for the majority are represented by specimens so large that it would be difficult to convey an adequate idea of their dimensions without giving their measurements, which is not now practicable. I made special note of two specimens that pleased me immensely, one a densely-flowered bush of Blance Double de Courbet, one of the most beautiful of the rugosas, fully five feet in diameter, and a standard of Gustave Regis, with a head four feet through. Very fine also were the examples of Rainbow, especially good in standard form; Harrisoni, Macrantha, Hebe's Lip, L'Ideal, Paul's Single White, and Moschata alba. Here also were great masses of the strong-growing Penzance briars, such as Amy Robsart, Brenda, and Lucy Ashton, rising to a height of ten feet, producing a profusion of flowers, and filling the air with their delicate perfume. The garden roses have as a boundary on one side a rose arch, over which various climbers spread luxuriantly, and produce a profusion of flowers. Chief among these are Crimson Rambler, Dundee Rambler, and Clair Jacquier, the specimen of the last-named having no equal. The growth covers a space of twenty feet by ten feet, and when I saw it it was bearing thousands of trusses of its pleasing flowers. The Garland was promising a not less attractive display, for, spreading over a boundary fence, it was furnished with an enormous number of trusses, some consisting of upwards of two hundred buds.

The show roses for the production of exhibition blooms are grown in the kitchen garden, and the teas and noisettes are grown almost exclusively as standards and half standards, these giving much better blooms with Mr. Orpen than dwarfs. There are about five hundred of these, and in walking through the lines special note was made of Cleopatra, Souvenir d'un Ami, Madame Cusin, Souvenir de S. A. Prince, Enchantress, one of the fine teas recently introduced by Messrs. William Paul and Son, and held in high estimation at West Bergholt, more especially for its continuity and profusion of flowering; Sylph, Maman Cochet, Marie Van Houtte, Caroline Kuster, Madame Hoste, Corinna, considered one of the best of the teas for the garden; and Anna Olivier. Mr. Orpen holds the hybrid teas in high estimation, and mentioned Caroline Testout, Viscountess Folkestone, Kaiserin Augusta Victoria, which makes magnificent standards; Madame Pierre Cochet, Marquis Litta, and Mrs. W. J. Grant.

A lover of flowers might linger long in this delightful garden, but after leaving the roses it was not possible to do more than take a cursory glance at the other features. It, however, could be seen that Mr. Orpen has an excellent collection of hardy plants, and that he takes an active interest in hardy fruits, which are cultivated with exceptional success.

Mr. B. R. Cant's Nurseries.

This important establishment has so much that is of interest to rosarians associated with it that I might devote ten times the space I have now available to it without any risk of tiring my readers. But for the present it must suffice to indicate rather than to speak in detail of the culture which has obtained for this veteran rosarian renown wherever roses are grown and appreciated, and has accomplished so much in the development of the rose-growing industry which has brought so much fame to Colchester. Unhappily, Mr. B. R. Cant's health has not for some time past enabled him to take an active part in the management of the business; but the regret one naturally feels in missing this veteran from the exhibitions and meetings, where for many years he has been a prominent figure, is mitigated by the knowledge that his two sons, Messrs. Cecil and E. Cant, have inherited their father's love for the rose, and possess those other attributes which have brought him so much honour and respect. We have some evidence of the success with which roses continue to be grown in the record of the metropolitan exhibition of the National Rose Society on the 2nd, when the challenge trophy in the great class for seventy-two, and the first prize in the not less difficult class for forty trebles, were awarded to Mr. B. R. Cant. But a much better idea is obtained by a walk, however brisk, through the fields in which the roses are grown. In an exceedingly pleasant spot on the high road running due north from the town, Mr. B. R. Cant has a farm of sufficient area to enable him to take several agricultural crops between each crop of roses, and the advantages of his being able to do this is sufficiently manifest in the splendid condition of the whole of the tens of thousands of plants. Altogether there are upwards of twenty acres under roses, and as a well devised system of rotation gives each batch of stocks practically new ground, the best possible growth is obtained without the excessive use of manure, or the aid of rich top dressings. The eight acre field of maiden roses presents such a glorious appearance, as to produce an impression upon the mind that will not be readily erased. Arranged in unserried ranks are the thousands of dwarfs and standards, chiefly the latter, and making so excellent a growth that the characteristics of the varied leafage is so fully developed that the novice in a surprisingly short space of time would be able to recognize each of the numerous varieties from the foliage alone. This field is laid out in large blocks, with wide spaces between them and the roses are planted in rows about three feet apart across them, the rows being continuous from one side of the field to the other, with the [illegible] that with the aid of a horse-hoe and smart cob, the surface soil can be readily maintained in a loose state throughout the season. One might have lingered long in the field, making notes of the peculiarities of the varieties of the several sections represented, but time flies and the acres of "cut backs" and of stocks had to be seen. In admiring the great breaks of standards, Mr. Cecil Cant said they were as popular as ever, and expressed the opinion that they would still further increase in popularity if planters would select none but those varieties which, by reason of their vigorous habit, are well adapted for that form of tree. Nearly all the hybrid teas are, he considers, well suited for culture as standard teas, but some of the finest of the hybrid perpetuals make splendid standards, and before the planting season again comes round I must ask him to give the readers of the GARDENERS' MAGAZINE the advantage of his unique experience.

The greatest wealth of flowers was to be found in the quarters devoted to cutbacks, and it would be safe to hazard a guess that the greater portion of the flowers with which Mr. Cant has obtained his honours this season have been cut from these. The maidens when I saw them were, in consequence of the lateness of the season, not sufficiently advanced to yield many blooms, or to afford an opportunity of seeing the new varieties at their best, for the latter are necessarily chiefly found amongst these; but they will yield their harvest in good time, and there should be a plentiful profusion of roses until quite late in the season. A few of the novelties were producing good blooms, and amongst them were Ferdinand Batel and Madame Cadeau-Ramey, of which cultivators should make note as valuable additions to the list of hybrid teas. An immensely attractive feature of these nurseries is the rose hedges, of which I shall have something to say at no distant date, but visitors should not forget to see them whilst in the full flush of their wondrous beauty.

Messrs. Frank Cant and Co.'s Nurseries.

These nurseries are situate in one of the most pleasant spots around Colchester, in the direction of Braiswick, and the rate at which they are extending suggests the idea that the firm is engaged in the endeavour to convert the district into one large rose garden. However that may be, we have evidence that the integrity, the energy, and the skill displayed by Mr. Frank Cant since he established himself at Braiswick, are meeting with their due reward in the form of a continuous increase in business. It is now some five years since I last had the pleasure of a walk through the fields of roses at Braiswick, and although I have been fully acquainted with the fact that the firm has been steadily increasing in popularity, I was not a little surprised to find how remarkable had been the augmentation in the resources of the establishment. At Braiswick a farm of I know not how many acres is devoted to roses which take their place in the rotation of crops, and thus have the advantage of land that has not been occupied by roses for several years previous. The benefit to the roses is made manifest in the splendid growth of both dwarfs and standards, and the superb development of the blooms. In walking through the breaks one is struck with the firm, short-jointed growth that is being produced, a point of some interest, as indicating conditions favourable to the production of fibrous roots, chief among these being a substantial yet friable soil, and good cultivation, the latter including a constant use of hand and horse hoe.

Mental note was made of a goodly number of varieties in walking through the several fields, but I cannot do now more than briefly refer to two novelties that have had their origin at Braiswick. The first is Mrs. Frank Cant, a beautiful hybrid perpetual, introduced a year or two since, and now becoming generally known and highly appreciated. This has finely formed flowers of a bright pink hue, and is remarkably free, as evidenced by the fact that in a quarter of cut-backs containing nine rows there were no less than two thousand five hundred blooms in various stages of development, and all of high quality, the average number on each plant being six. The other novelty is Muriel, a brilliant carmine-pink sport from Suzanne Marie Rodoconachi, which, by reason of its fine form and effective colour, has, unless I am much mistaken, a great future before it.

Garden roses receive the attention that becomes their importance, and amonst these the Penzance briars occupy a prominent position. The hedges of those in the nurseries admirably illustrate their value in the formation of boundaries, and the hedge which has been formed round a large pond is especially attractive, and affords an object lesson which those who have an opportunity of seeing should not be slow to take advantage of.

Messrs. D. Prior and Son's Nurseries.

The establishment of this enterprising firm is the most recent of the nurseries devoted to rose culture at Colchester, and, as in the case of the two others to which I have briefly referred, contains much that is of interest to rosarians. Situate within a comparatively short distance of the railway station, the nurseries occupy a position amid charming surroundings, and afford a great diversity of soils and aspects more or less favourable to roses, as evidenced by the splendid growth that is being made by the plants, and the high quality of the flowers. The firm has been long established, but it is only within a comparatively short period that they have devoted special attention to the cultivation of roses, and the new departure has been fully justified by the large number of prizes that have been obtained at the National Rose Society's exhibitions and other important gatherings, and the extension of business. Since roses have been made a special feature of the Myland Nurseries, field after field has been added until the nurseries have assumed the proportions of a farm of large area, and afforded facilities for growing roses of all classes to the highest possible state of development.

In putting the finishing touch to this hasty sketch of a day among the Colchester roses, I must acknowledge that the pleasure was greatly enhanced by the friendly feeling that exists amongst the several rosarians. They, of course, enter into a keen competition with each other, but it is with the most friendly spirit, and they are jealous only of the reputation the town enjoys as a great centre of rose culture. G. G.

THE BEST GUIDE to the garden for the whole year is the "Gardening Year Book," containing practical articles on the cultivation of Flowers, Fruit, Vegetables, &c. Price 1s. "Gardeners' Magazine" Office, 4, Ave Maria Lane, London.—[ADVT.]

WORK FOR THE WEEK.

COOL ORCHIDS.

CYPRIPEDIUMS are not, properly speaking, cool house orchids, yet there are many varieties that may be cultivated with a fair amount of success in this department. Cypripedium villosum, C. Boxalli, C. insigne, C. Exul, all thrive fairly well in the odontoglossum house; a moist and shady position in one corner of the house is what they enjoy. There are also C. caudatum, C. Charlesworthi, C. purpuratum, C. Spicerianum, and the pretty hybrid C. Arthurianum, having C. insigne as one of its parents. All grow well in the warmest of the cool houses, and many other hybrids having C. insigne, C. Boxalli, or C. villosum as one of their parents will be found to grow satisfactorily in this house. Of course, in good establishments, where orchids are made a speciality, better accommodation can be afforded them, the intermediate house being the best place for them. Consequently more satisfactory results are obtained, but those not having this accommodation need not be afraid to give them a trial in the cool department. All are now growing freely, and enjoy a plentiful supply of water at the roots, and in bright weather moderate shade. C. insigne comes in most useful for supplying cut flowers during the winter months, as this old species of the Lady Slipper is a great favourite, and is found in almost every collection of plants. This is not surprising, as it can be grown by anyone having a greenhouse in which to winter it, as during the summer months a cool frame in a shady position is all that it requires. As they are growing freely an abundant supply of water should be given, and any plants that have filled their pots with roots should receive occasional supplies of weak liquid manure; plenty of air should be kept on the frame at all times.

Maxillaria Harrisoniæ is an old and undeservedly neglected species. It is a native of Brazil, and was introduced in 1828. It is now flowering, and lasts a long time in good condition, the flowers emitting a most exquisite perfume. It is most valuable for cutting, as the flowers last an immense time in perfection in a sitting-room. Repotting should not take place unless really necessary, as the large roots are so easily damaged by disturbance, and consequently the compost should be free and open. The odontoglossum house will be found the most suitable place in which to grow it, choosing the shadiest part, as it is easily injured by sunshine. Red spider sometimes attacks the leaves, and a sharp look-out should be kept for them, holding them in check by sponging the leaves with soft water. Maxillaria grandiflora, M. venusta, and all others of this section will require a plentiful supply of water now they are growing freely. Miltonia vexillaria will now be passing out of flower, and nothing should be done to induce growth. The plants should be afforded a light position, and treated to an abundance of air day and night; sufficient water must be given to keep the compost in a nice moist condition, so as to maintain the foliage and pseudo-bulbs in a plump and healthy condition till such time as the new growths make their appearance. The late-flowering varieties of Miltonia vexillaria as M. v. rubella, M. v. Leopoldi, and M. v. superba are now coming into bloom and still rooting freely, consequently they should be afforded liberal supplies of water until they have passed out of flower.—E. SHILL, *New Hall Hey Gardens.*

STOVE PLANTS.

Plants in these structures have grown freely, yet as there has been such a small amount of sunlight their growths are of rather a soft nature and not able to bear up during a very hot day, especially if there is a breeze blowing also. Under these circumstances care will be necessary to prevent undue flagging, which entails a severe check to the plant; upon such a day commence to ventilate at an earlier hour than usual; by so doing the temperature may be kept from reaching too high a point, with a smaller opening of the ventilators than would be the case were the temperature allowed to rise before opening them. The paths and walls will require to be frequently damped; also syringe amongst the pots on the beds and stages; also see that the blinds are let down early in the day. In lean-to houses, upon which permanent shading is used, it may be found necessary to supplement this by throwing a piece of tiffany, or mats, over those subjects which it can be seen are most affected by the strong rays of the sun, or a newspaper may be placed over small plants during the hottest hours of the day. Young plants of Plumbago rosea and P. coccinea superba that are well established in three-inch pots may now be potted on into six-inch pots, using a compost of loam, leafsoil, well decayed manure, and sand. If they can be afforded a position along with the poinsettias it will suit them admirably. Plants of ixoras which flowered early, and have had a week or two's rest may now be slightly pruned and started into growth again. If they are liberally treated, freely syringed, and afforded a brisk heat they will make a good growth, and flower freely during the autumn. The flowers of ixoras are always appreciated, and cannot come amiss at any season. Autumn-struck cuttings of gardenias, which are now bushy plants in six-inch pots, may be transferred into eight-inch pots. Pot firmly; do not grow them in too high a temperature; pinch occasionally to keep the plants shapely—the object is to obtain large shapely plants with well-ripened wood, which will afford an abundance of flower early in the coming year. It will be necessary to attend to plants of thyrsacanthus regularly, and remove any scale there may be upon them; if followed up closely, and the scale removed while soft, it will not be difficult to clean them. Keep the suckers removed regularly from Pandanus Veitchi if shapely decorative plants are required; if the suckers are allowed to grow unchecked the plants become too heavy and massive from a decorative point of view. To ensure distinct variegation the soil must not be too rich, neither must the plants be highly fed. Bougainvillea glabra is now flowering freely as a roof climber in the intermediate house; any flowering shoots standing up towards the glass should be drawn carefully down so that they may display their full beauty from below; feed liberally, and on no account allow it to become dry at the root, else the floral display will be of short duration. It will be necessary to daily examine the plants beneath, removing the fallen bracts and leaves before they cause any injury.

Hibiscus that are growing and flowering freely must be liberally treated, as they require an abundance of moisture. Gloriosa superba is now flowering, and must not be allowed to suffer from dryness at the roots, and if treated well its flowering season extends much longer than is the case where a careless system of watering is followed. All the stove flowering plants as they come into bloom should be removed to a cooler structure until their beauty is past, the high temperature and moist atmosphere of the stove causing the flowers to soon fade away. In effecting this change of quarters see that they do not receive a check, also that they are not exposed to draughts. Afford all plants in the stove and intermediate house a thorough syringing twice daily in hot weather, and be sure the water reaches the under side of the leaves—this is where the insect pests mostly lurk—the object of such frequent syringings is as much for cleansing purposes as for refreshing the subjects operated upon. Keep the night temperature of the stove about 75 degrees, and the day temperature about 80 degrees; the intermediate house may range about eight degrees lower.—J. TUNNINGTON, *Ripley Castle Gardens, Yorks.*

KITCHEN GARDEN.

AFTER the refreshing showers of last week weeds of all kinds will grow apace, and to keep them under in showery weather is no light task, especially amongst growing crops. Every endeavour, however, should be made to free the land of them, otherwise it will be impossible for any plants to do well. In many places where ground is limited heavy cropping has to be resorted to, and before one can be cleared another is waiting to be planted. Strawberries being late this season make it difficult to clear the old plants off in time for broccoli to be planted. To overcome this difficulty the plants should be pricked out and there allowed to remain until such time as the ground can be got ready. The same remarks apply to borecole and savoys. Tomatos growing against walls and in the open ground will now be making rapid growth; every care must be taken to get a set as soon as possible, and when a sufficient number of trusses have formed, take out the points of the plants that all the strength may be concentrated in the fruit. No watering will be necessary unless the weather is very dry, in which case give sufficient to reach the roots. Cucumbers on ridges, if proper attention has been afforded them, will now be fruiting freely. It is not often that these plants require watering. In dry weather a little may be given, but not sufficient to lower the temperature of the soil. Vegetable marrows have done badly this year owing to the cold nights, so that they are late in fruiting. With more genial weather the fruit will swell apace, so that it will be necessary to give them more water. Peas may still be sown in warm, sheltered places, choosing the second early kinds, as these, being more hardy, are not likely to mildew. Dwarf beans should also be sown to keep up the supply. It is not often that runners do much sown after this date, but in sheltered situations not subject to early autumn frosts they sometimes well pay for any extra labour needed to grow them. In the more southern counties a sowing of cabbage seed should now be made of such varieties as Ellam's Early, Flower of Spring, and such dwarf varieties as Gem. The seed should be sown thinly in an open spot. Colewort of the Early London type may also be sown now. The main sowing of carrots for drawing during the winter ought to be sown during the second week of the month, particularly in the north. The ground should be rendered as fine as possible before sowing, and kept moist until the seed germinates. In the more northern parts of the kingdom, winter spinach may be sown, but in the south this should be deferred till August. Endive for an early supply should be sown on well-manured ground, and the plants encouraged to grow as rapidly as possible by liberal waterings. Celery must be planted as the trenches can be prepared, and liberally water that which has already taken hold of the soil. Plant out leeks for a late supply, also lettuce and parsley. A sowing of the latter may now be made for winter and spring use.—H. C. PRINSEP, *Buxted Park Gardens.*

FRUITS UNDER GLASS.

FIG trees cleared of their first crop in May will now have the second crop in an advanced stage, and, if the weather continues as it is at present, a little fire-heat at night will be necessary to assist swelling of the fruits and ripening the wood. I hardly remember such a cold, wet, and sunless June as we have passed through, and such wet weather at a time when we expect a maximum of sunlight is bound to leave its mark on such sun-loving things as fig trees. Should the trees have produced a heavy second crop, it will be advisable to thin down to a reasonable number, as there is no need to strain the trees at this time of the year when successional trees will be producing their first crop. My experience is that heavy second crops reduce the prospects of good first crops the next year when the fruits would be more valuable. See that the trees do not lack for water at the roots, and continue the use of manure water at each watering in the case of planted out trees, and at alternate waterings with pot trees. Do not slacken the efforts to keep down red spider by frequent syringings with clear soft water. The interval between the crops gives an excellent opportunity to clean the trees which must not be lost. The points of leading shoots on trees trained near the roof have a tendency to turn upwards towards the glass, and often become crippled by contact with it. This should be avoided by tying them down at frequent intervals, this being not only good for the leads dealt with, but it also allows a maximum of light to the shoots and leaves which they overhang. Ventilate the house freely whenever the weather is fitting, and leave a little air on all night.

In vineries the current work will be reduced to the routine of ventilating, stopping, and watering, details of which have already been given in earlier notes, and need not be repeated, except to emphasise the fact that swelling grapes will absorb a considerable amount of water, and on a sufficient supply being given, tempered with plenty of liquid manure, the ultimate size of berry reached will depend. It may still be necessary to go over the late vines with a view to a final thinning, for late grapes for keeping must be allowed plenty of room to develop their berries, which should be so thinned that they do not press much on each other or allow of condensed moisture settling between them, as this would be sure to lead to damping during spells of wet weather. Shouldering up the bunches will relieve some of the pressure, and by this means we may avoid cutting away too many berries and spoiling the proportions of what should be good weighty bunches. Overhead syringing will soon be unsafe, so other measures—such as sulphuring the pipes and frequent damping down—must be resorted to to keep down red spider. Where it is necessary to keep back ripe Hamburghs, or any other early black grapes, the colour and bloom may be preserved by shading the roof and keeping the house as cool as possible; in this way they will hang for a long time after ripening, providing the house is kept dry, without decaying, turning red, or shrivelling. For Muscats, even where started early, fire-heat is still necessary; indeed, I begin to doubt whether we shall be able to do without it at all this year, as in my case it is necessary to get the crop well forward so that it may be cut and bottled before the end of September. Late Lady Downes will still be liable to scaldings, and the house should not be entirely closed except perhaps for an hour or two in the afternoon, putting on a little again at six p.m., and increasing it next morning.

Melons, especially those in frames, are having a very bad time of it through the dull and cold weather, and they need great care in ventilating and in keeping up the requisite heat. Should dull weather continue, syringing should be entirely suspended for the time being. Where plants are in flower, or about to be so, there must be, in addition, care taken not to spill much water about the frame or to overwater the roots. Air sufficient to render the atmosphere buoyant and to dry the pollen must be given to such plants, as the fruits will not set without it. Fertilise the blossoms between eleven a.m. and one p.m., whenever the plants are driest, and miss no chance with any flowers which open, so that a good set may be assured. Renew the outside linings piecemeal and frequently, so that a steady bottom-heat is kept up, as a drop in the temperature may be fatal to the well-doing of the plants and productive of canker at the stem. Sow more seeds if late fruits are needed, and continue sowing at fortnightly intervals until mid-August if necessary. Continue strawberry layering as fast as the runners are ready, and see that the early layered ones are given water when they want it; also suppress any further tendency towards running beyond the plant layered.—J. C. TALLACK, *Livermere Park Gardens.*

EXHIBITIONS AND MEETINGS.

NATIONAL ROSE SOCIETY, July 2.

The Metropolitan exhibition of the National Rose Society was held on the above date at the Crystal Palace, Sydenham, and was a much finer display than had been anticipated. The effects of the season were noticeable, not so much in the lack of competitors as in the larger classes, where one could observe here and there a faulty bloom among an otherwise grand lot of flowers, thus proving that it was by no means easy for the competitor to bring together the necessary specimens. Altogether it was a great show, and the competition was very keen in the principal classes. The show was arranged right down the length of the Crystal Palace, and so there was ample light for the exhibits. Under the able direction of the Rev. H. H. D'Ombrain and Mr. E. Mawley, the hon. secretaries, the judges got to work soon after eleven o'clock, and completed their duties in about an hour and a quarter. The garden roses made an especially grand display.

NURSERYMEN.

Six of the leading rose-growing nurserymen competed for the Championship Trophy, and the post of honour was won by Mr. B. R. Cant, Colchester, who staged a magnificent lot of blooms; the varieties in the back row were Ulrich Brunner, Cleopatra, Alfred Colomb, Marie Finger, Marquise Litta, Madame Jules Finger, Gustave Piganeau, Caroline Testout, Heinrich Schultheis, La France, Duke of Edinburgh, White Lady, Comtesse de Ludre, Catherine Mermet, Dr. Andry, Mrs. J. Laing, Horace Vermet, Madame G. Luizet, Thos. Mills, Mrs. Sharman Crawford, Marie Baumann, Lady Mary Fitzwilliam, Comte Raimbaud, and Mrs. W. J. Grant; the middle row contained specimens of Souvenir de la Malmaison, Magna Charta, Maréchal Niel, Mons. Noman, Madame Victor Verdier, Madame Cusin, Kaiserin Augusta Victoria, Captain Hayward, Mrs. Paul, Charles Lefebvre, Hon. E. Gifford, Senateur Vaisse, Marchioness of Dufferin, Le Havre, Ernest Metz, Helen Keller, Innocente Pirola, Dupuy Jamain, Souvenir d'Elise Vardon, General Jacqueminot, Medea, Suzanne Marie Rodoconachi, The Bride, and Crown Prince; the front row consisted of blooms of Salamander, Marchioness of Downshire, Auguste Rigotaud, Souvenir d'un Ami, Marie Verdier, Golden Gate, Earl of Dufferin, Muriel Grahame, Abel Carriere, Bridesmaid, Alice Laxton, Maman Cochet, Edouard Andre, Madame de Watteville, Prince Arthur, Margaret Dickson, A. K. Williams, Madame Cadeau Ramey, Madame Delville, Madame Bravy, Etienne Levet, Merveille de Lyon, Dr. Sewell, and Souvenir de S. A. Prince. Messrs. Frank Cant and Co., Colchester, were second, with a splendidly bright set of well-balanced flowers; Messrs. Harkness and Sons, Bedale, Yorks, coming third.

There were five competitors in the class for forty trebles, and in this fine competition Mr. B. R. Cant again came first with a beautiful lot of flowers, the varieties being La France, A. K. Williams, Gustave Piganeau, Souvenir de S. A. Prince, Marquise Litta, Mrs. J. Laing, Medea, Dupuy Jamain, Margaret Dickson, Duke of Teck, Madame G. Luizet, Prince Arthur, Dr. Andry, Souvenir d'Elise Vardon, General Jacqueminot, La Fraicheur, Maréchal Niel, Charles Lefebvre, Golden Gate, Suzanne Marie Rodocanachi, Alfred Colomb, Mrs. Sharman Crawford, Comte Raimbaud, The Bride, Fisher Holmes, Mrs. W. J. Grant, Souvenir d'un Ami, Captain Hayward, Duke of Edinburgh, White Lady, Marchioness of Downshire, Le Havre, Kaiserin Augusta Victoria, Marie Baumann, Helen Keller, Catherine Mermet, Crown Prince, Caroline Testout, Ulrich Brunner, and Lady Mary Fitzwilliam. The second prize in this large class was worthily won by Messrs. A. Dickson and Sons, Newtownards, county Down.

Messrs. Prior and Son, Colchester, secured first place in the class for forty-eight roses, distinct, showing a very even set of flowers, the varieties being Prince Arthur, Caroline Testout, Ulrich Brunner, Margaret Dickson, Marquise Litta, Marchioness of Dufferin, Helen Keller, Mrs. Sharman Crawford, Gustave Piganeau, White Lady, Dupuy Jamain, Mrs. W. J. Grant, Charles Darwin, Mrs. J. Laing, Duke of Edinburgh, and La France in the back row; Kaiserin Augusta Victoria, Abel Carriere, The Bride, Etienne Levet, Madame Gabriel Luizet, Comte Raimbaud, Souvenir de S. A. Prince, A. K. Williams, Magna Charta, Dr. Andry, Caroline Kuster, Prosper Languier, Alba Rosea, Prince Camille de Rohan, Rubens, and Marie Baumann in the middle row; Fisher Holmes, Marie Verdier, Alfred Colomb, Souvenir d'un Ami, Duke of Fife, Margaret Dickson, [illegible] Andry, Marchioness of Downshire, Beauty of Waltham, Souvenir d'Elise Vardon, Horace Vernet, Cleopatra, Duke of Wellington, Marie Van Houtte, E. Y. Teas, and Lady Mary Fitzwilliam in the front row. There were four competitors, and Messrs. Townsend and Son, Worcester, came second, with Messrs. Burrell and Co., Cambridge, third. The were seven entries in the class for two dozen blooms, distinct, and the first prize fell to Mr. C. Turner, Slough, for a very even set: General Jacqueminot, Ulrich Brunner, and Horace Vernet were splendid blooms. The second prize was awarded to Mr. G. Prince, Oxford, and the third to Mr. J. Mattock, Old Headington, Oxford.

For the best dozen blooms of varieties sent out by Messrs. A. Dickson and Sons, Newtownards, co. Down, the Messrs. A. Dickson and Sons were winners of the first prize with very fair blooms of Mrs. Sharman Crawford, Helen Keller, Mrs. W. J. Grant, Tom Wood, Robert Duncan, Jeannie Dickson, Countess of Caledon, Marchioness of Dufferin, Killarney, Ard's Rover, Muriel Grahame, and Daisy: Messrs. F. Cant and Co. secured the second prize; and Mr. B. R. Cant, Colchester, third. The Messrs. Dickson have thus won their own cup. A very beautiful exhibit of twelve bunches of roses, to include not more than six tea or noisette varieties, came from Mr. J. Mattock, Old Headington, and secured the chief place in its class; only seven trusses were allowed per bunch, but Mr. Mattock staged his blooms admirably with foliage, and made a pretty display; Messrs. Paul and Son, Cheshunt, second; and Mr. G. Prince, Oxford, third.

NURSERYMEN'S TEA ROSES.

Four competitors entered in the nurserymen's class for twenty-four blooms, distinct, of tea and noisette varieties, Mr. G. Prince, Oxford, securing the leading award with a fine set of blooms that consisted of Comtesse de Nadaillac, Souvenir de S. A. Prince, Madame De Watteville, Innocente Pirola, Maréchal Niel, Rubens, Mrs. Pierrepont Morgan, and Cleopatra in the back row; Hon. E. Gifford, Princess of Wales, Marie Van Houtte, Maman Cochet, The Bride, Francisca Kruger, Ernest Metz, and Anna Olivier in the middle row; with Amazone, Madame Hoste, Catherine Mermet, Mons. Furtado, Souvenir d'un Ami, Muriel Grahame, Princess Beatrice, and Golden Gate in the front row; Messrs. Prior and Son, Colchester, followed second; and Mr. B. R. Cant, third. Mr. J. Mattock scored for a dozen tea and noisette roses, his best blooms being The Bride, Souvenir d'Elise Vardon, and Rubens; Messrs. Burrell and Co., Cambridge, second; and Messrs. Townsend and Sons, Worcester, third. For eighteen teas and noisettes, three blooms of each, Mr. G. Prince, Oxford, won first place with a set in which there were some grand roses, notably Comtesse de Nadaillac, Innocente Pirola, Madame Cusin, Bridesmaid, and Ernest Metz; Messrs. Prior and Son, Colchester, second; and Messrs. F. Cant and Co., Colchester, third.

OPEN CLASSES.

Mr. B. R. Cant, Colchester, won the first prize in the class for a dozen blooms of distinct hybrid teas, showing good flowers of La France, Lady Mary Fitzwilliam, Souvenir de Pres. Carnot, La Fraicheur, Duchess of Albany, White Lady, Mrs. W. J. Grant, Antoine Rivoire, Clara Watson, Marquise Litta, Caroline Testout, and Kaiserin Augusta Victoria; Messrs. Prior and Son, Colchester, second; and Messrs. F. Cant and Co. third. Seven dozens were staged in the class for any yellow rose, and here Messrs. Prior and Son took chief place with Marie Van Houtte in fine condition; Mr. G. Prince second with Maréchal Niel, and Messrs. A. Dickson and Sons third with Marie Van Houtte. For twelve blooms of any white rose, Mr. Prince was the foremost competitor, winning from ten other exhibitors, and staging lovely flowers of Souvenir de S. A. Prince; Mr. B. R. Cant came second with Margaret Dickson; and Mr. A. Hill Gray, Beaulieu, Bath, third with The Bride.

There were ten boxes of any light or dark crimson rose, and the best twelve blooms were an even set of Ulrich Brunner, sent by Mr. C. Turner, Slough; Messrs. Townsend and Son, Worcester, second with Gustave Piganeau, and Messrs. Harkness and Sons, Bedale, third with Horace Vernet. With lovely flowers of Mrs. W. J. Grant, Mr. B. R. Cant led in the class for twelve blooms of any light pink or rose-coloured rose; there were thirteen competitors, and Messrs. A. Dickson and Sons were close second also with Mrs. W. J. Grant; Mr. C. Turner, Slough, third with Mrs. John Laing. No less than eleven boxes of blooms were put up in the class for a dozen blooms of any one variety of a tea or noisette rose, and here Mr. G. Prince, Oxford, took first prize with such fine blooms of Comtesse de Nadaillac as he only can show; Messrs. Townsend and Sons, Worcester, second with beautiful blooms of Rubens, and Messrs. Prior and Son third with the same variety.

The best dozen blooms of any new rose were examples of the lovely Mrs. W. J. Grant, put up by Mr. B. R. Cant; Messrs. A. Dickson and Sons, second, with Ulster; and Messrs. Paul and Son, Cheshunt, third, with the Rev. Alan Cheales. There were three sets of a dozen new roses, distinct varieties, and here Mr. B. R. Cant scored with Mavourneen, Beauté Lyonnaise, Mrs. W. J. Grant, Mrs. Rumsey, Madame Cadeau Ramey, Empress Alexandra of Russia, Souvenir de President Carnot, Helen Keller, Tom Wood, Antoine Reviore, Marguerite Appert, and Souvenir de Jeannie Caband; Messrs. A. Dickson and Sons, Newtownards, second; and Messrs. Paul and Son third. Mr. G. Prince won in the class for nine bunches of roses suitable for buttonholes, with very pretty vases, each carrying seven blooms; Mr. J. Mattock second. Mrs. O. G. Orpen showed the best three sprays of roses, putting up neat buds in an elegant manner with maidenhair fern; Mr. G. Prince second.

AMATEURS.

The amateur champion trophy was closely and keenly competed for by six exhibitors, and the result was that Mr. E. B. Lindsell, Bearton, Hitchin, secured it once again, with a very handsome set of flowers; his varieties were Captain Hayward, Gustave Piganeau, Charles Lefebvre, Duchess de Vallombrosa, Beauty of Waltham, Mrs. J. Laing, Ulrich Brunner, White Lady, M. Bernardin, Marchioness of Dufferin, Dupuy Jamain, and Mrs. S. Crawford, in the back row; Mrs. W. J. Grant, Horace Vernet, Maman Cochet, Duke of Edinburgh, Madame Cusin, Comte Raimbaud, Marie Van Houtte, Souvenir d'Elise Vardon, and A. K. Williams, in the second row; with Madame Hausmann, Caroline Testout, Earl Dufferin, Helen Keller, Marie Baumann, Heinrich Schultheis, Duke of Wellington, Suzanne Marie Rodocanachi, Senateur Vaisse, Madame de Watteville, Xavier Olibo, and The Bride, in the front row. The Rev. J. H. Pemberton, Havering-atte-Bower, Essex, came second; and Dr. S. P. Budd, Bath, third. Seven competitors entered in the class for two dozen roses distinct, and here the chief honours were taken by Mr. F. H. Flight, Turnstiles, Twyford, who had lovely blooms of Le Havre, Captain Hayward, A. K. Williams, and Margaret Dickson; Mr. R. E. West, Reigate, a good second, and Mr. Mease, gardener to A. Tate, Esq., Downside, Leatherhead, third. There were only four competitors in the class for a dozen trebles, but Mr. Lindsell showed a grand lot of blooms in his first prize set; the varieties were Duke of Wellington, Charles Lefebvre, Souvenir d' Elise Vardon, Ernest Metz, Captain Hayward, Suzanne Marie Rodoconachi, Beauty of Waltham, Helen Keller, Duchess de Vallambrosa, Dr. Sewell, Gustave Piganeau, and A. K. Williams. Mr. C. Salter, gardener to T. B. Haywood, Esq., Woodhatch Lodge, Reigate, second; and Colonel J. H. Pitt, Turkey Court, Maidstone, third. Mr. Chas. J. Grahame, Wrydelands, Leatherhead, won easily in the class for twelve blooms of any but a tea or noisette rose, showing immense flowers of White Lady; Mr. E. B. Lindsell, second, with Horace Vernet; and Dr. Budd third, with Caroline Testout; there were four competitors in this class.

The best eighteen blooms distinct in the section open only to growers of less than 2,000 plants, came from Mr. Conway Jones, Hucclecote, Gloucester, who showed very fair flowers of Charles Lefebvre, Kaiserin Augusta Victoria, Victor Hugo, La France, Horace Vernet, Marèchal Niel, Gustave Piganeau, Chas. Darwin, the Bride, Comte Raimbaud, Mrs. Laing, A. K. Williams, Roseriste Jacob, Mrs. W. J. Grant, Tom Wood, Suzanne Marie Rodoconachi, Comtesse Ludre, and Jeamie Dickson; Mr. E. M. Bethune, Denne Park, Horsham, second; and Mr. R. E. West, third, out of eleven stands. The class for eight trebles was a popular one, and here Mr. R. E West was first with fine flowers; Mr. P. G. Burnand, Reigate, second, and W. C. Romaine, Esq., Windsor, third. For nine blooms of any rose, save a tea or noisette, the winner was Mr. E M. Bethune, with Kaiserin Augusta Victoria; Rev. H. A. Berners, Harkstead Rectory, second, with Margaret Dickson, and Mrs. P. Bernand, third, with Duke of Wellington. Mr. E. Moules, Hitchen, was first for a dozen bloom in the smaller classes, securing the piece of plate offered to growers of less than a thousand plants. The leading prize winners in the section for growers of less than five hundred plants were Mr. J .C. Trueman, Oaklands, Swanley; Mr. H. Foster, Ashford; Mr. G. A. Hammond, Burgess Hill; and Mr. R. Cook, Stonebridge Park.

The challenge cup, open to small growers, and presented by Mr. C. J. Grahame for the best twelve roses, was won by Mr. G. Moules, Hitchin, with neat examples of A. K. Williams, Madame Hoste, Captain Hayward, Anna Olivier, Dr. Sewell, Rubens, Fisher Holmes, Hon. E. Gifford. Exposition de Brie, La France, Roseriste Jacobs, and Horace Vernet; Mr. L. Parry, Dorchester, second; and Mr. E. Wilkins, Sidcup, third. For four trebles, the prizes were taken by Mr. E. Wilkins, Mr. M. Hodgson, and Mr. J. H. Scott-Tucker, Oxford, in the order given. The best half-dozen blooms of one variety were specimens of the handsome Mrs. W. J. Grant, shown by Mr. G. H. Cook, The Briars, North Finchley.

The Ramsey Cup, offered as a first prize for twelve blooms, and open to all amateurs was won by Mr. O. G. Orpen, Colchester, who staged first-rate flowers of Marquise Litta, Kaiserin Augusta Victoria, Mrs. W. J. Grant, Souvenir d'Elise Vardon, Catherine Mermet, Horace Vernet, Rubens, Marèchal Niel, Captain Hayward, Lady Mary Fitzwilliam, A. K. Williams, and Margaret Dickson; Rev. J. H. Pemberton, second; and Mr. P. Burnand, third; there were thirteen competitors. The Rev. J. H. Pemberton was first for nine varieties of roses, seven trusses to a bunch of each; he showed A. K. Williams, Comtesse de Nadaillac, La France, Ulrich Brunner, Caroline Testout, Mrs. W. J. Grant, Marie Van Houtte, Prince Arthur, and Souvenir d'un Ami. Out of fourteen competitors, Mr. J. Carter, Mill House, Halstead, won the piece of plate offered by Messrs. Prior and Son for amateurs who have never previously won a N.R S. prize; the competition was for six blooms. For six blooms shown by new members of the N.R.S., Mr. J. Hinton, Batheaston, was easily first. The Rev. J. Moor, Arundel, was also a first prize winner, with six blooms.

Mr. Conway Jones scored with six new roses, showing Helen Keller, Princess de Venosa, Marjorie, Mrs. W. J. Grant, Sylph, and Tom Wood. The best half-dozen blooms grown within eight miles of Charing Cross were examples of Margaret Dickson, Ulrich Brunner, Captain Hayward, Magna Charta, Madame Lambard, Hon. E. Gifford, shown by the Rev. G. Moor, Lyminster Vicarage, Arundel. The second prize was won by Mr. J. B. Marsh, Claygate, Surrey.

Amateurs' Tea Roses.

The amateur tea rose trophy, together with a replica, was won this year by Mr. A. Hill Gray, Beaulieu, Bath, who showed splendid specimens of the following eighteen roses: Souvenir d'un Ami, Maman Cochet, Ernest Metz, Jules Finger, Alba Rosea, Princess Beatrice, Souvenir d'Elise Vardon, Comtesse Panisse, Bridesmaid, Comtesse Nadaillac, Medea, Souvenir de S. A. Prince, Hon. Edith Gifford, Marie Van Houtte, Cleopatra, Catherine Mermet, Maréchal Niel, and The Bride. Mr. Conway Jones, Hucclecote, Gloucester, won the second prize, and Mr. O. G. Orpen, of Colchester. the third. The best twelve teas and noisettes were shown by Mr. A. Hill Gray, Beaulieu, Bath, who had lovely flowers of Bridesmaid, Maréchal Niel, Souvenir d'Elise Vardon, Ernest Metz, the Bride, Maman Cochet, Souvenir de S. A. Prince, Catherine Mermet, Alba Rosea, Comtesse de Nadaillac, Anna Olivier, and Souvenir d'un Ami. Mr. Mease, gardener to A. Tate, Esq., Leatherhead, second; and Mr. E. M. Bethune, third.

Mr. A. Hill Gray was also successful in the class for eight trebles, teas, or noisettes; his examples were charming blooms of The Bride, Princess of Wales, Madame Hoste, Comtesse de Nadaillac, Maréchal Niel, Catherine Mermet, Souvenir de S. A. Prince, and Ernest Metz. Dr. Budd second, and Colonel Pitt third. In the class for nine blooms of any tea or noisette, Mr. A. H. Gray again proved invincible, scoring with exquisite flowers of Catherine Mermet; Dr. Budd second with Madame Hoste; and Mr. Bethune third with Comtesse de Nadaillac. Mr. O. G. Orpen set up some very pretty roses in the class for six distinct tea or noisette varieties, seven trusses of each, showing Enchantress, Hon. E. Gifford, Marie Van Houtte, Anna Olivier, Souvenir d'un Ami, and Comtesse Panisse; Mr. A. Evans, Oxford, second.

In the smaller amateurs' classes for teas and noisettes the leading prizewinners were: Mr. Conway Jones, who showed especially well; Mr. R. F. Hobbs, Worcester; Mr. J. T. Strange, Aldermaston; Mr. E. Mawley, Berkhamsted; Mr. M. Whittle, Leicester; Mr. A. Munt, Slough; the Rev. G. E. Jeans, Isle of Wight; Mr. J. Trueman, Swanley; Mr. R. E. West, Reigate; and Mr. L. Parry, Leicester.

The vases of roses were tastefully arranged, and the winning vase was filled with lovely flowers by Mrs. O. G. Orpen, Colchester; Mrs. E. Mawley second.

Garden Roses.

The two displays of thirty-six bunches of garden roses made up a splendid show, and in a close competition Messrs. Paul and Son, Cheshunt, took first place with splendid bunches of Madame Worth, Madame G. Bruant, Rose Apples, Blanche Moreau, Camoens, W. A. Richardson, Dawn, Gustave Regis, Amy Robsart, Tuscany, Madame Falcot, Souvenir de C. Cochet, Blanche Double de Courbet, Allister Stella Gray, Alba, Marquis of Salisbury, Maman Cochet, Laurette Messimy, Madame C. Guinoisseau, L'Ideal, Ma Paquerette, Royal Scarlet, Madame P. Ducher, R. rugos fimbriata, Morletta, A. M. de Montravel, Madame Pernet, Madame E. Risal, Crimson Rambler, Una, Green Mantle, Rosa Mundi, Claire Jacquier, James Veitch, Janet's Pride, and Perle d'Or; Messrs. G. Cooling and Son, Northgate Street, Bath, came a good second. Mr. J. Mattock won the premier award for eighteen bunches of garden roses, his bunches of Marquis of Salisbury, Madame P. Ducher, and Ma Capucin being especially good; Mr. C. Turner, Slough, second.

The silver cup for the best twelve bunches of garden roses, not less than three trusses to a bunch, was won by Mr. Mease, gardener to A. Tate, Esq., of Leatherhead, with bunches of Marquis of Salisbury, Perle d'Or, Gloire de Rosemanes, Safrano, Rosea Mundi, Anna Maria Montravel, Red Damask, W. A. Richardson, Reine Olga de Wurtemburg, Hebe's Lip, Bardou Job, Gustave Regis. The second prize was won by the Rev. J. H. Pemberton, Havering; the third by Mr. O. G. Orpen, Colchester. Mrs. A. F. Perkins, Oakdene, Holmwood, was first for nine bunches of garden roses, her huge sheaf of Marquise de Salisbury being especially fine; Miss Dorothy Nesfield, Speldhurst, Kent, second.

The exhibits of Penzance Sweet Briars were very pretty, and Mr. Orpen's first prize set of twelve bunches was a fine display; the varieties were Lady Penzance, Lord Penzance, Jeannie Deans, Lucy Ashton, Lady Bertram, Brenda, Anne of Gierstein, and Amy Robsart; Mr. F. W. Campion, Reigate, second.

Medal Roses.

A gold medal was awarded to Messrs. Cooling and Sons, Bath, for their pretty new hybrid bourbon rose named Purity.

The best blooms in the show, gaining silver medals, were as follows: Best tea or noisette, nurserymen, Comtesse de Nadaillac, shown by Mr. G. Prince, Oxford; Gustave Piganeau was the best H.P., and it was shown by Messrs. J. Townsend and Son, Worcester. In the amateurs' classes Mr. A. Hill Gray, Bath, had the best tea rose in Comtesse de Nadaillac, and Mr. Lindsell the best H.P., with a superb bloom of Mrs. John Laing.

Trade Displays.

A first-rate exhibit of hardy flowers was staged by Messrs. Barr and Sons, Covent Garden, who showed beautiful bunches of irises, pæonies, and delphiniums, together with Eryngium alpinum, Campanula latifolia macrantha alba, Hemerocallis fulva, H. f. variegata, Aconitum lycoctonum, Heuchera sanguinea, Iris Kæmpferi, Philadelphus Lemoinei, and many other charming subjects. A bank of roses in pots was arranged in front of the orchestra by Messrs. J. Veitch and Sons, Chelsea; this was a fine exhibit, but the plants were rather too closely staged for elegant effect. Bamboos, Hydrangea paniculata, and Cocos plumosus made a first rate background with skimmias and euryas as an edging; a most fragrant exhibit. Liliums and calochorti from Messrs. R. Wallace and Co., Colchester, made up a pretty exhibit, and one that was greatly admired, for roses and lilies seem always to associate well; L. auratum Whittyi and L. Washingtoniana were especially noteworthy. A gorgeous display of well grown cannas with superb spikes, produced in forty-eight sized pots was the contribution of Messrs. H. Cannell and Sons, Swanley; there can be no question as to the value of cannas when grown as at Swanley.

Messrs. J. Laing and Sons, Forest Hill, showed tasteful bouquets and other floral arrangements, and also put up a most effective group of plants that consisted largely of their celebrated tuberous begonias associated with gloxinias, ferns, bright crotons, elegant palms, orchids, and liliums. Messrs. Laxton Brothers, Bedford, sent baskets of their newer strawberries—Royal Sovereign, Mentmore, and Leader, the latter a heavy cropping variety and of good size. Messrs. G. Jackman and Sons, Woking, contributed hardy flowers, and made an extensive and bright display with garden roses, sweet peas, pæonies, delphiniums, &c., &c. Sweet peas from Mr. F. E. Foster, Brockhampton Nurseries, Havant, were bright and fragrant, and shown in considerable variety. Messrs. Dobbie and Co., Rothesay, had a most attractive exhibit of violas and sweet peas, around which the lady visitors were thickly clustered during the whole of the afternoon. The lovely Malmaison carnations were well shown and tastefully displayed by Messrs. W. Cutbush and Son, Highgate. Roses in abundance, both specimen blooms and bunches of garden roses were staged in fine condition by Messrs. G. Bunyard and Co., Maidstone. Hardy flowers, representing the popular herbaceous plants, were staged by Messrs. J. Cheal and Son, Crawley, Sussex, who also sent violas and gloxinias.

SOUTHAMPTON ROSE SHOW, June 28 and 29.

The Royal Horticultural Society of Southampton has for many years been celebrated for its excellent exhibitions of garden produce, and the two days' show held on the above dates may be written down as in every way satisfactory. It is some years since a show of roses was held in Southampton, and the happy idea of arranging one on the Royal Pier was amply justified. The cool and spacious pavilion is quite an ideal place for cut blooms on a hot summer's day, the temperature being quite ten degrees cooler in this building than in the large tent erected near by for the accommodation of other exhibits. The taking of the show to the people, as it were, in such a delightful position has doubtless proved successful financially, if one may form an opinion from the large number of visitors on the opening day.

Though it was nominally a rose show, the schedule was very comprehensive, and included valuable prizes for plants, fruit, and vegetables, all of which were well shown, and, generally speaking, good competitions were the rule. The entries in the rose classes were limited, owing chiefly to the lateness of the season, but in the first prize stands excellent quality was found. In the open classes Mr.

CAUTION!

M. L. LINDEN, Brussels, regrets very much to be obliged to reply to the "CAUTION" published by M. Florent Claes in "GARDENERS' CHRONICLE" of the 2nd of July last, but he is compelled to do so in the interest of truth, and he maintains that, contrary to several advertisements of M. Claes, **not a single grand form of Odontoglossum crispum** has flowered from M. Claes' importations since 1891. In addition, M. Linden makes publicly known the following:—

I.—Till to-day (6th of July), M. Linden has not received any notice of the threatening steps taken against him.

II.—What proves the published letter of the late M. J. Linden? Only that a "GOOD MANY VERY EXCEPTIONALLY LARGE PLANTS" arrived. But on flowering they turned out to be very poor varieties.

III.—The letter of M. Lucien Linden, Nov. 7th, 1894, says that he has received "DRIED FLOWERS AND DRAWINGS"! But how were the living plants in flower? Not one turned out as represented in the drawings. One of the drawings represented as a NEW ODONTOGLOSSUM (Nouveauté superbe) was only BATEMANIA Lalindei!

IV.—It must be added that in the same year of 1894, M. Claes sent a large consignment of a "NEW WHITE CATTLEYA," of which the same M. Claes wrote: "IT WILL NOT DISPLEASE ME SHOULD THIS SPECIES BE NAMED AFTER ME, IT WILL REVENGE ME SOMEWHAT FOR CATTLEYA ALEXANDRÆ, and I could LAUGH IN MY TURN WITH MESSRS. THE ENGLISHMEN WHO TRIED TO SPOIL THAT PLANT." On the unpacking of the large consignment of that NEW WHITE CATTLEYA, they were only EPIDENDRUM CILIARE!! This gives an idea of what M. Claes calls grand varieties!!

V.—M. Lucien Linden again repeats, that not a SINGLE PLANT coming from the importations of M. Claes are or have been in cultivation in the Establishment at Moortebeek, only built in 1895.

VI.—It might be necessary to add that ODONTOGLOSSUM ALDENARDENENSE, which M. Claes describes now as "THE GRANDEST AND MOST WONDERFUL VARIETY KNOWN UP-TO-DATE, FLOWERED IN AN IMPORTATION THIS YEAR," is only known in Europe till now by a DRAWING AND DRIED FLOWER! It is to be hoped that it will turn out better than the plants M. Claes sent to M. Linden in 1894.

This is the final answer M. Linden will give to the ridiculous pretensions of M. Claes, of which it was necessary to inform the public. For the rest M. Linden awaits with confidence the decision of the Law Courts of Belgium.

M. CLAES HAS NO RIGHT WHATEVER IN USING M. LINDEN'S NAME IN OFFERING AND SELLING HIS OWN IMPORTATIONS OF ODONTOGLOSSUMS.

George Prince, of Oxford, showed splendid flowers, winning easily in three classes. Messrs. Prior and Son, Colchester, secured first honours in the classes for three blooms each of eighteen varieties, and also for six blooms of any dark coloured rose. In the amateurs' division Mr. F. W. Flight took chief honours in each class for very nice flowers, though by no means equal to the fine blooms from Oxford in the open division. Apart from the roses, one of the most attractive features of the exhibition was the pretty effect produced by the bright and nicely-arranged groups of miscellaneous plants which were set up in the centre of the pavilion. Mr. Carr, gardener to W. A. Gillett, Esq., who included a number of choice orchids in his arrangement, secured the first prize; Mr. Wills, of Shirley, being second with a very pretty group. Mr. Carr also staged a lovely collection of orchids, which included many choice species, the gem of the lot being a well-flowered specimen of a very richly-coloured Cattleya gigas Sanderiana; Lælia purpurata and L. tenebrosa were also in fine form.

Of miscellaneous exhibits special mention must be made of the beautiful group of Malmaison carnations from Messrs. Cutbush, Highgate Nurseries, which was deservedly awarded a silver medal. The plants were in robust health, and carrying large flowers. Mr. Ladhams, of Shirley, put up a gorgeous bank of hardy flowers, which the firm make a speciality; these were a source of great attraction, and were highly commended. A pretty group of sweet peas in pots was sent by J. Key Allen, Esq., and was much admired; this also was highly commended by the judges. Some very fine strawberries were sent by the society's president, Sir Samuel Montague, M.P., and these received a cultural certificate, the variety being Royal Sovereign. The Messrs. Webb contributed from their Stourbridge Nurseries a fine lot of cut flowers, including some very good stocks. Other growers, including Messrs. Jarman and Co., Chard; Messrs. Hillier, Winchester; Messrs. Longster, Bassett; and Mr. W. Roberts, Southampton, sent collections of various cut flowers; Mr. Wills, Shirley, sent plants, and Mr. Lickfold, of Southampton, a lovely display of floral designs, bouquets, &c., all of whom received complimentary acknowledgments of their excellent exhibits.

The show throughout was, as is usual at Southampton, admirably arranged and very interesting. It will fully warrant an annual recurrence and a still better and more extended patronage.

The varieties in Mr. G. Prince's first prize stand of thirty-six roses were Viscountess Folkestone, Duke of Edinburgh, Comtesse de Nadaillac, Salamander, Souvenir de S. A. Prince, Mrs. Grant, Maréchal Neil, Ulrich Brunner, Madame Hoste, Mrs. Crawford, Xavier Olibo, Mrs. J. Laing, Princess Beatrice, Duke of Wellington, Augustine Guinoisseau, Her Majesty, Prince Arthur, Alba Rosea, Amazone, Golden Gate, Caroline Testout, Rubens, Ethel Brownlow, and Cleopatra. For eighteen roses, three blooms each, Messrs. Prior were first, Messrs. Frank Cant and Co. second, and Messrs. Jarman third. Fine blooms of A. K. Williams, Prince Arthur, Helen Keller, Mrs. Grant, and Mrs. Sharman Crawford were amongst those in the first prize stand.

Mr. Prince came first for a dozen tea or noisette roses, with excellent flowers of Cleopatra, Maman Cochet, Comtesse de Nadaillac, Souvenir de S. A. Prince, Souvenir d'un Ami, Maréchal Niel, Catherine Mermet, Princess of Wales, Alba Rosea, Madame de Watteville, The Bride, and Souvenir d'Elise Vardon; Messrs. Prior and Son second. For six blooms of any light-coloured rose, Mr. Prince was first, with good blooms of Comtesse de Nadaillac; while the Messrs. Prior were first for a dark rose, with A. K. Williams.

In the amateur division for eighteen blooms distinct, Mr. Flight was first; Dr. Seaton second; and Mr. West third. For twelve blooms distinct, Mr. Flight was first; Mr. West second; and Captain Ramsay third. Messrs. Flight, West, and Newman won the prizes for a dozen blooms, teas or noisettes.

For a conservatory group of miscellaneous plants, Mr. Carr was first; Mr. Wills second; and Mr. Peel, gardener to Miss Todd, Shirley, third. Mr. Ladhams made a good exhibit of twelve bunches of hardy flowers, and was easily first. Mr. Hall staged a good collection of fruit for first prize, and was also first in the class for grapes.

In the vegetable classes valuable prizes were offered by Messrs. Sutton and Sons, Messrs. Toogood, and Messrs. Webb and Sons, the first prize in each class being taken by Mr. Wilkins, gardener to Lady Theodora Guest, Inwood House, Blandford, with excellent produce, distinctly ahead of the other competitors. Various classes were also provided for amateurs and cottagers. and in cut flower arrangements for ladies, which were well contested.

Mr. Fuidge, who has served the society as secretary for so many years, manages everything, with the committee, in the best possible manner, judges and exhibitors being unanimous in their praise of the working of the exhibition.

MARKETS.

Covent Garden.

SUPPLIES of fruit are daily increasing, while vegetables are plentiful and good. There is a brisk demand throughout, and a clearance is usually effected at reasonable rates. Strawberries and cherries find a quick sale.

FRUIT.—Tasmanian apples, 8s. to 16s. per case; English grapes, 1s. 6d. to 2s. 6d.; Jersey, 1s. to 2s. per lb.; pineapples, 2s. to 4s. 6d. each; bananas, 5s. to 10s. per bunch; cherries, 3s. 6d. to 8s. per half-sieve; strawberries, 2s. to 9s. per dozen punnets, 2s. to 3s. 6d. per peck; gooseberries, 2s. 6d. to 3s. 6d. per bushel; apricots, 6d. to 1s. per box; peaches, 2s. 6d. to 10s. per dozen; French, 10d. to 1s. 2d. per box; English tomatos, 4d. to 5d.; Jersey, 3d. to 4d. per lb.; Spanish, 1s. to 1s. 3d. per box; green figs, 2s. 6d. to 4s. 6d. per dozen; lemons, 6s. to 15s. per case.

FLOWERS.—Arums, 3s. to 4s.; carnations, 1s. to 3s.; eucharis, 3s. to 4s. gardenias, 1s. to 3s.; Lilium Harrisi, 3s. to 4s.; tea roses, 6d. to 1s.; pink roses, 2s. to 5s.; red roses, 1s. to 4s.; cattleyas, 6s. to 9s.; Odontoglossum crispum, 1s. 6d. to 4s.; and tuberoses, 1s. to 1s. 6d. per dozen blooms; Adiantum cuneatum, 4s. to 8s.: marguerites, 2s. to 4s.; mignonette, 2s. to 4s.; pelargoniums (scarlet), 4s. to 6s.; stephanotis, 1s. 6d. to 3s.; lily of the valley, 6d. to 1s.; white gladiolus, 6d. to 9d. and pelargoniums, 4d. to 6d. per dozen sprays.

VEGETABLES.—Egyptian onions, 4s. to 5s. per cwt.; English spring, 1s. 6d. to 2s. 6d. per dozen bunches; endive, 1s. 3d to 1s. 6d.; cucumbers, 1s. 6d. to 3s. 6d.; cauliflowers, 1s. to 2s. 6d. per dozen; mushrooms, 6s. to 8s. per 12 lbs.; new carrots, 3s. to 4s.; turnips, 3s. 6d. to 5s.; parsley, 1s. to 1s. 6d.; mint, 2s. per dozen bunches; peas, 1s. 6d. to 4s. per bushel, 2s to 4s. 6d. per sack; French beans, 3d. per lb.; spinach, 1s. 6d. per bushel; cabbage lettuce, 6d. to 10d. per score; cos, 1s. 4d. to 1s. 6d. per dozen; marrows. 3s. to 4s. 6d. per dozen; Jersey potatos, 6s. to 7s.; St. Malo, 4s. 6d. to 5s.; Cherbourg, 4s. 6d. to 5s.; Malta, 4s. to 5s. per cwt.

Borough Potato Market.

Very large supplies are now being received, but there is a good demand at fair prices, English kidneys and White Beauties, 6s. 6d.; St. Malo, 5s.; Jersey Flukes, 6s.; kidneys, 5s. 6d.; Cherbourg Flukes, 5s.; kidneys, 4s. 6d. to 5s. per cwt.

ANSWERS TO CORRESPONDENTS

Editorial communications should be addressed to the Editor of the GARDENERS' MAGAZINE, 148 and 149, Aldersgate Street, E.C.

Ashleaf Potatos.—W. S., South Wales: The tubers sent are fine handsome ones for this early date, and large as well. They do not represent any form of the Ashleaf Kidney with which we are acquainted, and are much too robust to belong to that variety. What the variety is we cannot tell at present, as the tubers are not mature, and there are no opportunities for proper comparison at this season. The variety is worth taking care of as an early sort for your district, whatever it may be elsewhere.

Black Spot on Tomatos.—J. R., Wigan: The attack is a rather bad one of the dreaded Black Spot, a fungus known as Cladosporium lycopersici. The fungus attacks the pistil, sometimes as soon as the young fruit has set, and from this it radiates, forming a black flat patch over the apex of the fruit. Often the attack is not sufficient to absolutely spoil the whole fruit for culinary purposes, but it always renders it useless for sale. If allowed to ripen such fruits as you have sent will be useless for food, while they will be serving to spread a troublesome fungus. The best plan will be to remove and burn all the affected fruits, and any that subsequently appear with a black spot. Ventilate freely, and in every way do all possible to maintain a buoyant atmosphere in the house; a little artificial heat will probably be necessary, as the nights are by no means warm as a rule this summer. There is no remedy known to be effective without destroying the plants, and we know of no preventive. Even in the best grown collections of tomatos Black Spot sometimes appears, but affected fruits are removed as soon as seen.

Losses in Bedding Pelargoniums.—A. C. R., Faversham: There is something radically wrong in the soil to make the pelargoniums die away as in the specimens sent, and as the plants have only been affected in a few places along the extensive border, it would almost appear as if foul play were the cause. An excessive application of some chemical manure would produce a similar result, especially if given in a liquid state, as it would burn up the roots and the stem below the ground line. This, of course, might happen by accident in the case of a badly-mixed liquid, where the last poured from the can would be immensely stronger than the first. We have seen an escape of both coal and sewer gas do similar injury, but in such cases the damage occurred in a restricted area, and almost in a straight line. We trust these remarks may help you to fix upon the cause of the mischief, and we suggest, by way of experiment, that in some cases you remove the soil at the points where plants died, replace it with new material, and plant again; in others do not remove the soil, but plant again as before. Let us know the result if you make the experiment.

Names of Plants.—H. C., Southall: A form of Adiantum scutum.

Amblecote, Surrey: Lathyrus latifolius and L. l. albus.

A. L., Lovat: Probably Buddleia globosa; send a specimen when the shrub is flowering, if you can.

We have received one parcel of specimens that contained no card or letter to show whence it came; it also contained a half-grown peach and a peach stone. While we recognise the careful economy of the sender in first eating the peach and then sending the stone to us for identification, we must express our regret at being unable to name the variety on such evidence. With regard to the plants, Nos. 1 and 4 should be sent when in flower; 2 is Eleagnus longipes; 3, Inula glandulosa.

CLAY'S LONDON FERTILIZER TRADE MARK

CLAY'S
SUCCESSFUL GARDENING
By EMINENT SPECIALISTS, with ILLUSTRATIONS,
CONTAINS A SPECIAL CONTRIBUTION UPON
"ROSES: THEIR SELECTION AND CULTIVATION,"
By H. C. PRINSEP.
WITH FULL DIRECTIONS FOR USE OF

S.C. CLAY'S INVIGORATOR TRADE MARK.

CLAY'S FERTILIZER. INVIGORATOR.

"A concise yet excellent handbook, equally useful to the amateur, the practical gardener, and the grower for market. The subjects dealt with comprise all the most important plants, flowers, fruits, and vegetables, and each of the chapters is written by a horticulturist who is not only master of the subject, but is able to discuss the details in a manner that cannot fail to interest his readers."—*Gardeners' Magazine.*

"'CLAY'S SUCCESSFUL GARDENING' is a well written and useful work, teeming with valuable information. Its publication will, I am sure, make clear to thousands the great difference between the proper use and the abuse of CLAY'S FERTILIZER, which I have long regarded as a perfect plant food, and continue to use largely. In the interests of horticulture I trust the day is at hand when CLAY'S will be in every garden in Great Britain."—*H. Dunkin (Head Gardener to the Earl of Warwick), Castle Gardens, Warwick.*

"CLAY'S FERTILIZER is one of the best and safest artificial manures ever offered to the public. For plants in pots it is invaluable. Having tried the preparation for some years I have no hesitation in recommending it as a first-class all-round manure."—*James H[illegible] (Head Gardener to the Earl of Jersey), Osterley Park Gardens, Isleworth.*

"CLAY'S SUCCESSFUL GARDENING" is published at 1s., post free, or of Seedsmen, &c.

CLAY'S MANURES are sold in 6d. and 1s. Packets, and SEALED BAGS—7 lbs., 2s. 6d.; 14 lbs., 4s. 6d.; 28 lbs., 7s. 6d.; 56 lbs., 12s. 6d.; 112 lbs., 20s.

Or from the Manufacturers, Carriage paid in the United Kingdom for Cash with Order (except 6d. Packets).

NOTE.—Every PACKET, BAG, and SEAL bears the respective TRADE MARK, which is THE ONLY GUARANTEE OF GENUINENESS.

THREE INSERTIONS FOR THE PRICE OF TWO!

A MAN WANTS SITUATION in a suburban nursery; low wages would be accepted in return for extended experience in nursery.—E. ELSLEY, 10, Redman Place, High Street, Sevenoaks.

BARR and SONS have on their Register several competent HEAD GARDENERS. They will be pleased to furnish full particulars on application.—12 and 13, King Street, Covent Garden, London.

GARDENER (Head) where three or four are kept; life experience in all branches; age 40; married, two children; good references.—Address J. DENTON, Up Down Hill, Windlesham, Surrey.

GARDENER (Head of two or three, or good Single-handed).—A gentleman highly RECOMMENDS S. Lane as above, who has been with him four years; age 26; single; near London preferred.—Address S. LANE, 3, Albert Cottages, Albert Road, St. Mary Cray, Kent.

GARDENER (Head, where another is kept), no objection to Good Second, where four or five are kept; 8 years in present situation as Second; 17 years' experience; single.—S. E., The Gardens, Highlands, Bolney, Sussex.

GARDENER (good Single-handed, or with help); thoroughly experienced both Inside and Out; age 29; three years in last place.—"W. P," 48, Lewisham Road, S.E.

GARDENER (Head or Single-handed).—Gentleman can highly RECOMMEND his late gardener, left through breaking up establishment; life experience, inside and out; age 36; married.—W., 3, Spring Grove Gardens, East Molesey, Surrey.

GARDENER (Head Working).—Scotch; age 40, married; life experience Inside and Out; 12 years in last place as Head. Abstainer. Excellent characters.—D. B, Green Hill, Calverley, near Leeds.

GARDENER (Head Working or good Single-handed); Scotch; age 30; life experience in vines, peaches, tomatos, cucumbers, melons, stove and greenhouse plants, flower and kitchen garden; satisfactory reasons for leaving; first class references from present employer as to character and ability; total abstainer; married when suited.—C. W., 2,916, "Gardeners' Magazine" Offices, 148 and 149, Aldersgate Street, E.C.

PRACTICAL LANDSCAPE GARDENING and ESTATE DEVELOPMENT CO.

This Company undertakes to advise as to the laying out of gardens, the general improvement of landed property, and the development of building estates; to provide plans and estimates, and, for a fixed sum, to carry out all work incidental to the making of the smallest Villa garden as well as to the designing and execution of the most extended estate improvements.

It has a staff of experienced foremen, and all necessary plant.

No charge whatever is made for plans, which, however, remain the property of the Company unless the work is carried out by it.

All communications to be addressed to—

Owing to continued increase in circulation, the "Gardeners' Magazine" now goes to press on Wednesday. No advertisement can be guaranteed insertion, or altered, unless received before Four p.m. on that day.

NOTES OF THE WEEK.

GRASS ORCHARDS.

ACCORDING to the most recent returns, there are 224,000 acres of orchards in Great Britain, and of this area all but three per cent. is situate in England, a fact in no way surprising, considering the more favourable conditions of soil and climate that obtain within its boundaries. Of the English acreage there are nearly 100,000 acres in the four counties of Devon, Hereford, Somerset and Worcester, and in the first three of these the orchards consist chiefly of grass land planted with fruit trees. In Worcestershire the largest proportion of the orchards are under grass, although there is a considerable area of cultivated land devoted to fruit culture, as at Evesham, and some places on the borders of the Severn. In Kent, Gloucestershire, and Shropshire, there is also a large percentage of grass land planted with standard fruit trees, and it is estimated that of the 218,000 acres of orchards in England, 170,000 acres are of this description. In discussing the present condition of English orchards, the *Journal* of the Board of Agriculture directs special attention to the state of orchards in grass, and it is a matter of much interest that the views so fully set forth in the series of articles published in the GARDENERS' MAGAZINE, under the title of "The Wasted Orchards of England," and reprinted in separate form, are amply confirmed. We are told in the opening remarks that "from the appearance of these grass orchards it is evident, even to those who know but little of fruit culture, that a large proportion of them is not producing half as much fruit as it should, and that a great deal of the fruit yielded is of a common kind and of poor quality. Even in counties where general fruit cultivation is carried out intelligently and well, as in Kent, Gloucester, and Shropshire, there are grass apple orchards in nearly as bad a condition as those of the western counties." It is further pointed out that many of the owners consider it quite unnecessary to manure grass land on which fruit trees are planted. In the greater part of these orchards the grass has been regularly mown or fed off by lean stock without corn or cake, and without the application of any compensating fertilising materials, in the mistaken belief that standard apple and pear trees require nothing to help them to produce continuous crops of fruit beyond that which they obtain at some distance below the surface and from the atmosphere. It is also generally assumed that grass growing between fruit trees requires nothing and takes nothing out of the soil, whereas it absorbs the available plant food from it as far as the roots extend, and materially interferes with the proper aeration of the soil so important in the earlier years of the life of the trees. These facts are fully stated in "Wasted Orchards," but they will bear reiteration, more especially as their importance is now recognised by one of the great departments of the Government, and their appearance in the present form is the best possible proof of the great care that was shown in conducting our investigations. There can be no question as to the advantage of cultivating the spaces between the trees of apple, pear, and plum orchards, but if the soil is naturally fertile excellent results may be obtained from grass orchards when the trees receive proper attention, and the grass is fed off by sheep or cattle. The trees suffer most from the grass during the three or four years after they are planted, as shown by the experiments conducted at the Woburn experimental fruit farm. In the course of these it was demonstrated that the grass reduced the size of the leaves of apple trees two years after planting by 41 per cent., and the growth by 74 per cent. The results of the Woburn experiments, coupled with the condition of orchards that are met with on all sides, should be sufficient to convince the most sceptical that if we are to compete successfully with American and Canadian apples we must follow the example of the growers in these countries and cultivate our orchards.

GARDENERS' EXCURSIONS.

THE excursion of the National Chrysanthemum Society on Monday to one of the seaside resorts in East Anglia, which the enterprise of the Great Eastern Railway Company has done so much to popularise, and the visit of the Horticultural Club to Slough and Stoke Pogis on Tuesday is sufficient evidence that the holiday spirit is abroad, and that the horticulturists in the metropolitan district have been brought within its influence. These excursions have been so admirably planned that nothing but fine weather is wanting to ensure abundant enjoyment to those who are so fortunate as to be able to take part in them, and we, therefore, trust the elements will on each occasion be favourable. We have nothing to urge against day trips to places of interest, but it appears to us that the time has come when an endeavour should be made to arrange excursions extending over two or three days to enable horticulturists to visit gardens and parks in distant parts of the country and at a cost well within the means of the average gardener. There can hardly be anything more beneficial to practical horticulturists from all points of view than to visit establishments far enough away for the work to be carried out under conditions different to those which obtain at home, and to derive the full advantage from such visits some amount of co-operation is essential. This is necessary not only for the purpose of enhancing the pleasure and the educational value of the excursion, but for the purpose of effecting a material reduction in both railway and hotel expenses. To make a long railway journey individually involves a larger expenditure than the majority of gardeners can well afford, but, owing to the enterprise that is now being shown by the railway companies, there would be no difficulty in obtaining for parties of thirty or forty greatly reduced rates for travelling, and it should be possible to obtain favourable terms from the hotels. There are many centres from which several gardens of importance could be visited in two days from London, and, as an example, we would mention "the Dukeries," which include three or four first class gardens of different character that could be visited without any undue tax upon the strength in two days, including a railway journey of about one hundred and fifty miles in either direction. It would be possible to go a farther distance, but there are many good centres within a radius of a hundred miles from London, and, indeed, of Manchester, Liverpool, Leeds, Exeter, Southampton, and other of the great provincial towns; and we would strongly advise that centres be selected just far enough for their horticultural features to be investigated without undue hurry in the time at disposal, that the members of the party may be able not only to thoroughly enjoy the visit, but derive some practical advantage from it. We know that some gardeners' associations succeed in covering two or three hundred miles, and visiting three or four gardens, in the course of some fifteen or sixteen hours; but such excursions are of but little benefit either physically or mentally to those who take part in them.

IMPORTS OF FRUIT AND VEGETABLES.

THE Board of Trade returns for June are, we are pleased to state more satisfactory than they have been for several months past, and there is a material increase in both the exports and imports. In the case of the exports of both British and Irish produce and manufactures, there is an increase in each section, with the exception of that for textile fabrics, in which there was a material drop in values. In the section devoted to fruits the decreases predominate, the most important drops being in the imports of apples and oranges. Of apples we received 17,241 bushels only, against 66,669 bushels in the corresponding month of last year, the values being £9,373 and £26,868 respectively. The imports of these fruits for the six months ending June 30 were 914,828 bushels, of the value of £341,471, as compared with 2,049,406 bushels, of the value of £566,443 in 1897. Cherries were received in increased quantities, the imports amounting to 166,017 bushels, of the value of £117,399, or an increase in quantity of 7,956 bushels, and in value of £19,311; but on the six months there is a small drop both in quantity and value. Grapes also show an increase, the imports amounting to 5,018 bushels, against 4,469 bushels last year; but with an increase of 549 bushels, there is a decrease in value of £1,033. But few pears are imported in June, and last month the imports nearly reached the vanishing point, for four bushels only, of the value of £2, were received, which is the lowest price per bushel recorded for some years past. Plums also show a decrease of 5,230 bushels, the quantities received having been 9,543 bushels, against 14,773 bushels last year, and the respective values are returned at £10,503 and £18,639. Unenumerated fruits were received in much larger quantities than in the two corresponding months of the preceding years, and the increase in value as compared with June, 1897, is £30,640. Potatos again show a material increase, the imports amounting to 1,533,374 cwt., of the value of £669,947, and of this quantity we received 72,039 cwt. from Germany, 443,272 cwt. from France, 870,235 cwt. from the Channel Islands, and 147,838 cwt. from other countries. Our imports of potatos for the six months were 5,683,953 cwt., of the value of £1,664,349. The increase in the imports of onions was considerable, the quantities received having been 388,746 bushels, of the value of £56,426 in June, and 2,432,849 bushels, of the value of £376,395 in the six months.

"Gardeners' Magazine" Rose Number.—It gives us much pleasure to acknowledge the hearty congratulations received from our readers in all parts of the United Kingdom on the success achieved by our Rose Number, published on the 9th inst. In discharging this agreeable duty we would assure our correspondents that their expressions of approval are immensely gratifying to us, inasmuch as they afford additional evidence that our efforts in the cause of rose culture, as of all other aspects of floriculture and horticulture, are highly appreciated. We fully agree with the opinion expressed by a large proportion of our correspondents that the superb coloured plate is worth more than the small sum charged for the issue, and we have no hesitation in stating that in no other form has so much that is of interest and useful to those engaged in rose culture been published at the price of the issue. In reply to numerous inquiries, we have to add that the publisher is still able to supply copies.

National Rose Society's Exhibition at Halifax.—The Northern Exhibition of the National Rose Society at Halifax on Thursday last was a splendid success and the best of the series. There was a strong competition throughout, and the blooms were of high quality. Messrs. Harkness and Sons, of Bedale and Hitchin, were in splendid form, and won the provincial trophy and the premier awards in the classes for seventy-two and thirty-six. Mr. E. B. Lindsell, Hitchen, was successful in winning the amateurs' trophy, and Mr. O. G. Orpen and Mr. H. V. Machin specially distinguished themselves, and Mr. G. Prince, of Oxford, was strong in the tea classes. Two gold medals were awarded to Messrs. A. Dickson and Sons, of Newtownards, for new roses, the varieties being Mrs. Edward Mawley and Mildred Grant, and one to Messrs. James Cocker and Sons for a variety named Mrs. James Cocker. The weather was fine, and the attendance of visitors large.

The Walnut-leaved Rhus (*Rhus juglandifolia*) is usually a tree of moderate size, native of Western America, ranging from Mexico to Peru, and inhabiting mountainous districts, up to at least 3,500 feet above the level of the sea. Galeotti describes it as a beautiful shrub, having pale yellow, fragrant flowers, growing in woods in the Cordillera of Vera Cruz, at an elevation of 3,000 feet. Birschel designates it a large tree, growing at an altitude of 3,500 feet, near Guarenas, in the province of Caracas, and bearing the name of "Manzanillo Bovo." Purdie, who collected it in New Grenada, states that it is "the celebrated Palo Petro-Fernandez"; and on another label he describes it as a large forest tree. According to the *Kew Bulletin* there are specimens in the Herbarium from several other collectors and localities, but they are unaccompanied by any remarks. Ernst enumerates Rhus iuglandifolia among woods and timbers, under the vernacular name of "Manzanillo de Cerro." Not one of the foregoing Spanish names is given in Seemann's "Die Volksnamen der Amerikanischen Pflanzen," and we have found no published account of its possessing poisonous properties, which, from its popular name "Manzanillo" (Manchineel) might have been expected. But some months ago Mr. J. V. Sigvald Muller, of Guayaquil, sent to Kew fruiting branches of Rhus juglandifolia; one parcel named "Aluvilla blanca," and another "Aluvilla negra." There were slight differences in the foliage, but we could find nothing to distinguish them specifically. Mr. Muller, however, is of opinion that they are distinct, and states that both have the reputation of being exceedingly venomous. So far as we understand, his information was all derived from hear-say, and is merely traditional. Indeed he states that he had met none except Indians who even knew the name "Aluvilla." There may be a grain of truth in the tradition, though it is almost certain that Rhus juglandifolia is not harmful to Europeans.

Diseased Cherry Leaves were received by R.H.S. Scientific Committee from Mr. B. G. Berry, F.R.H.S., Scarbutts Manor, Broughton, Faversham, and submitted to Dr. W. G. Smith, who reports as follows: "I cannot make up my mind whether the fungus on cherry leaves you sent last week is Cylindrosporium padi, *Karst*, or Claderosporium amygdalearum, *Pass*. Both are given as causing spots on foliage similar to that sent. The spores are different, but I get both forms (or something very like them) present. In any case the fungus is the cause of trouble. The disease is common in the United States, though I have no definite record of its occurrence here. It is not considered serious and yields easily to spraying remedies. I am afraid at present the crop is too far advanced to allow of immediate treatment, but as soon as the fruit is plucked Bordeaux mixture should be sprayed on the foliage. Next year the spraying should be continued as soon as the foliage is strong enough to allow it. It should not be used towards the season of ripe fruit, as it stains the cherries, but applied before and after is reliable."

Flavour in Strawberries.—We were pleased to observe that in the collection of strawberries exhibited by Messrs. James Veitch and Sons at the meeting of the Royal Horticultural Society on Tuesday, varieties remarkable for high flavour were well represented. One of the most important of these was Veitch's Prolific, a distinct variety raised by the firm from a cross effected between Empress of India and Royal Sovereign. The fruits are large and handsome, bright in colour, and richly flavoured, and, as suggested by the name, they are produced in great abundance. Especially worthy of note also was Exquisite, a distinct variety, raised from Lord Suffield, possibly fertilised with pollen from Waterloo. This has somewhat conical, wedge-shaped fruits, of a dark crimson colour and with bright red flesh; the flavour is surprisingly rich, in the latter respect quite surpassing the British Queen, which has long been regarded as the standard variety for flavour. This is a good cropper, and the strawberry for those who have a higher appreciation for flavour than for mere bulk in these fruits, for no more richly-flavoured strawberry has yet been introduced.

The Apple Sucker (*Psylla mali*) is reported to have been very plentiful in orchards this season, and to have done considerable damage in some districts. In many cases much injury was done to the trees attacked before the cause of the mischief was recognised, owing to the small size of the pest. Spraying with soft soap and quassia extract in solution is one of the best means of holding the apple sucker in check. Very beneficial also is spraying with Paris green; but owing to the habit of the pest in making its way between the innermost folds of the blossom there is a difficulty in subjecting it to the full effects of washes used to poison its food or make it unpalatable.

Gold Medal Garden Rose.—The award of a gold medal to a garden rose by the National Rose Society at the Crystal Palace, on the 2nd inst., is not without precedent, for Turner's Crimson Rambler obtained that distinction on its introduction, but it is nevertheless of interest as a proof that the society is prepared to recognise new varieties of merit to whatever section they may belong. The conferring of this coveted distinction upon Messrs. Cooling's Bourbon Purity, has to us additional interest, from the fact that the large body of eminent rosarians—on whom the duty devolved of making awards to novelties—confirmed the high opinion we expressed of its merits when it first came under our notice rather more than a year since. In referring in the GARDENERS' MAGAZINE of June 12 to some of the objects of interest in Messrs. Cooling's nurseries, we observe: "We must refer, however, to a grand open air new seedling white rose, of which we are certain to hear more in due course. It has the neat foliage of a Bourbon, and is rampant in growth, and the long bent-over shoots produce at every joint a medium-sized blossom, which is nearest in colour to *Devoniensis*, but is beautifully reflexed like *Madame Bravy*. The petals are of good substance, and it was the only good double rose out at the time in the nurseries on June 7th. This habit of early bloom, freedom of growth, and pureness of colour, with the stout footstalks and erect H.P.-like pose of the flowers, mark it out as the coming white or flesh-white florists' rose." For decorative purposes in a cut state Purity has much to recommend it, and it has the promise of becoming a popular rose for market.

Jean Linden Memorial.—Soon after the death of the late M. J. Linden, several friends joined in the project to perpetuate the memory of the celebrated explorer and learned botanist, whose loss is deplored by the horticultural world, his innumerable discoveries having enriched our gardens and houses with so many beautiful plants. The idea of erecting a monument to his memory has emanated and received a large adherence, the same to be erected at Brussels, where M. Linden passed the greater part of his life. To realise this object, which is the wish of all those who have known the great part taken by him in the development of modern horticulture, a committee has been formed under the presidency of Count O. de Kerchove de Denterghem, President of the Royal Botanic and Agricultural Society of Ghent, and comprises the Count de Bousies, Orchidophile, Mons; M. de Middeleer, President of the Royal Society Linnéenne of Brussels; M. Dutrieu de Terdonk, Secretary of the Royal Horticultural Society of Malines; M. Kegeljan, President of the Royal Horticultural Society of Namur; M. Lubbers, Secretary of the Royal Floral Society of Brussels; M. Massange de Louvrex President of the Royal Horticultural Society of Liége; Baron Osy de Zegwart, President of the Royal Horticultural Society of Antwerp; and M. Warocqué President of the "L'Orchidénne," Brussels. M. Kegeljan has kindly accepted the function as treasurer, and M. Lubbers those of secretary. It has been decided to address an appeal to botanists, amateurs, and nurserymen, [illegible] public establishments and societies, in Belgium and abroad, to give this [illegible] an international character. Subscriptions will be received by M. F. [illegible], Banker, Namur, Belgium.

Cost of Daffodil Culture.—Some idea of the cost of growing the narcissus may be formed from rough estimates given verbally by Mr. White, of Spalding, to Mr. W. E. Bear, and recorded by him in the current issue of the Royal Agricultural Society's *Journal*. Supposing, he says, 200,000 bulbs of moderate size to be planted on an acre, costing £4 per 1,000, and allowing £40 an acre as the cost of manuring, cultivating the land, planting, weeding, picking, and marketing, the total would be £840 per acre. Probably rent, rates, and taxes are included in the £40. Some varieties of bulbs cost a great deal less, and some a great deal more, than £4 per 1,000, and Mr. White makes the total expenses per acre range from £400 to £1,000. But these amounts apply only to the first year, even to growers who have to buy their bulbs, as the bulbs [illegible] from two to three years, the extremes being one to four years on the [illegible] question. Therefore the average annual expenses would be very [illegible] the amounts given. Again, growers would not find a market for all the [illegible] grow, and, therefore, when they produce their own bulbs for planting, these [illegible] not be valued at the selling price in reckoning the actual cost of production. If a grower bought 200,000 bulbs at £4 per 1,000, the cost might be spread over three years, making it about £266 per annum, while the cost of planting could be similarly treated. Whatever the precise amount per annum might be, however, it clear that the annual returns from flowers and those obtained from bulbs at the end of three years would need to be very large to cover expenses and afford a profit. At the present time Mr. White has in growth 1,500,000 bulbs of Ornatus, between 400,000 and 500,000 each of Sir Watkin and of Horsfieldi, 750,000 of common double daffodils (Telamonius plenus), 1,000,000 Double Whites, 100,000 each of Emperor and Grandee, 40,000 of Empress, and a number of other varieties. He usually begins to pick forced flowers in the first week of January, and finishes at about the end of February or early in March, when the open-air flowers are ready. To show the difference of time between the flowering in Scilly and in Lincolnshire, it may be pointed out that whereas Mr. White began to pick Emperor and Empress only on April 7 or 8, the whole of the former and about half of the latter had been marketed from Tresco by March 14.

Apple and Peach Crops in America.—The condition ot apples in America, in all the New England States except Rhode Island, is considerably above the average for this season. In New York it is five points above the ten-year-average, in North Carolina eight points above, in Michigan seventeen points, in Wisconsin thirty-one points, in Iowa eight points, and in Nebraska thirteen points. On the other hand the present early indications are less favourable than usual in the following states and to the extent indicated: Rhode Island five points, New Jersey four points, Maryland eight points, Virginia four points, Georgia three points, Alabama three points, Arkansas thirteen points, Tennesse eleven points, West Virginia thirty points, Kentucky twelve points, Ohio seven points, Indiana fifteen points, Illinois six points, Missouri eleven points, Kansas one point. Excepting in New Jersey, Delaware, Maryland, Kentucky, Tennesse, Mississippi, and Arkansas, the season has been highly favourable for peaches throughout the entire eastern half of the country. In Georgia, probably the greatest peach-growing state in the Union, the condition is one hundred and five, against an average June condition for the last ten years of sixty-one.

Hybrid Tea Medal Roses.—By an inadvertance we omitted to give in our report of the National Rose Society's exhibition, at the Crystal Palace, the names of the blooms of the hybrid teas selected for the medals offered for the best blooms of varieties belonging to the second class. We now supply the omission, by stating that the medal in the amateurs' division was awarded to Mr. C. J. Grahame for a magnificent bloom of White Lady, and the medal in the nurserymen's division was awarded to Messrs. Paul and Son for a finely developed bloom of Mr. W. J. Grant.

The Rainfall in Wiltshire, as recorded at the Compton Bassett Gardens by our coadjutor, Mr. W. A. Cook, during the past half-year, was as follows:—In January rain fell on ten days, and the total amount was 45 inches; February, seventeen days, 1·74 inches; March, twelve days, ·79 inches; April, thirteen days, 2·02 inches; May, twenty-three days, 2·50 inches; June, eleven days, 2·07 inches.

Intending Emigrants are informed, on the authority of the Emigrants' Information Office, Broadway, Westminster, S.W., that there is a good opening for experienced farm hands in Canada at this season of the year. There is no great demand for labour in New South Wales, notwithstanding the total acreage under cultivation this year is considerably more than it was in 1897. In Victoria the general demand for labour has ceased, but there are excellent openings for men who understand fruit-growing. In the sugar-growing districts of Queensland there is a good demand for farm labourers during the crushing season, which lasts from June to December. Farm labourers are wanted in Western Australia, but not in Tasmania; New Zealand affords opportunities to experienced farmers with capital, while in Cape Colony marked progress is being made in developing the important industry of fruit growing.

Investigation of Respiration in Plants.—It has long been known that methylene blue is capable of being decolorised by reducing agents, but botanists appear not to have recognised the possibilities latent in the methods, perhaps because some ten years ago Pfeffer stated that though fermenting yeast would decolorise the blue solution, green plants would not do so. Doubtless this was true under the conditions of Pfeffer's experiments, but nevertheless, many green plants are, as a matter of fact, found to give admirable results. Mr. J. B. Farmer states in a communication to *Nature* that if germinating seedlings of barley or peas be placed in test tubes filled with a 0·0005 per cent. solution of methylene blue, which has been boiled in order to expel air, it will be found that in the course of a few hours the liquid around them will have lost its colour. The most striking way of performing the experiment is to suspend the peas in the solution, then a decolorised zone is formed between the upper and lower parts of the liquid, each of which still retains its blue colour. Gradually the clear zone extends until the entire mass of the liquid, except just at the surface where it is in contact with the air, becomes decolorised. At first the radicles of the seedlings are strongly stained, they finally again become white. If some of the decolorised liquid be drawn off by means of a pipette, and shaken up with air, the blue tint speedily returns. If some of the seedlings be removed from the now colourless liquid, and be rinsed in boiled water and then exposed to the air, they soon become blue, and the stain gradually extends into the internal tissues as these become gradually aërated. The "development" of the blue can readily be seen in sections, quickly made, under the microscope. Cress seedlings are far more active than either barley or peas, just as would have been expected from the relations which they exhibit towards oxygen. The most remarkable results are, Mr. Farmer observes, those obtained from a plant like Chara. This alga is suspected to possess peculiar properties in regard to its connection with oxygen, and it has been ascertained in several ways that the plant is nearly as greedy for oxygen as are many seedlings. A branch of Chara placed in the methylene blue and put in the dark, will decolorise the surrounding liquid in a few hours; but if the tube containing it be exposed to the action of bright daylight the colour soon returns when the plant is alive, owing to the evolution of oxygen consequent on its splitting up the carbon dioxide which has been evolved by it, and which has been accumulating in the water, during the plant's stay in darkness. Many other plants fail to give such quick results; thus Elodea requires about two days in darkness to obtain the reaction. All the plants experimented on give a result much more quickly if they have previously been starved of oxygen. And this indicates that the oxygen is not directly utilised either by the protoplasm, or some of the normal combustible bodies present in the cell, but by some dissociation product formed during metabolic activity of the protoplasm. Of course, decoloration of the blue does not occur when the plants are exposed to the action of free oxygen; this element can then be obtained more cheaply than by reducing the aniline dye. These facts have been arrived at during an investigation by Mr. Farmer, which is still proceeding, into the respiratory processes of plants. The method here detailed is, however, so simple, and seems likely to prove useful to teachers and others as a demonstration-experiment, that it is important to make it generally known.

Black Currant Shoots Falling.—Mr. E. Ballard submitted specimens to R.H.S. Scientific Committee, from a large plantation, which break off at a slight touch or by the wind. Mr. W. G. Smith, who has examined them, reports upon them as follows: "The currant leaves bore a mildew, but other fungi were also present when I examined the material. The characteristic mode of attack pointed to a Peronospora species. I have raised good crops of one on fresh portions of the leaves, and am following up the clue. If it be really a species of this family it is new to Britain, although one (Plasmopora ribicola) has been reported from U.S. America. I have observed the emission of motile swarm spores from the sporangia (so-called spores) of fresh material, and otherwise feel sure of the Peronosporeæ nature of this fungus. As to remedy, I should recommend a spraying of Bordeaux mixture or allied copper mixture. To a black currant plantation this could be done by a knapsack sprayer, which are readily obtainable."

New Early Pea.—Mr. E. Beckett writes: "The new early pea, Thomas Laxton, is one of the very best early peas that has come under my notice. It is said to be a cross between Gradus and Earliest of All, but in appearance it much resembles Ne Plus Ultra, except that the pods are double the size; the latter are of a deep green colour and well filled, and the flavour is excellent. With us it proved to be earlier than Gradus, and only a few days behind Earliest of All. In my opinion, it will become a great favourite with exhibitors of vegetables; also for market and home use in general. I can fully endorse the good opinion formed by the Fruit and Vegetable Committee, last week, at Chiswick. I am enclosing a few pods for your inspection." The pods sent by our able coadjutor are large and handsome, and the peas, of which there are eight or nine in each pod, are of a fine deep green colour, and of high flavour when cooked.

Metropolitan Parks and Gardens.—The report presented to the monthly meeting of the Metropolitan Public Gardens Association evinced, as usual, a considerable amount of activity on the part of the governing body. It was reported that since the last meeting the garden which the association laid out in York Street, Walworth, and the Central Park and drinking fountain, East Ham, had been formerly opened to the public. It was agreed to undertake the laying-out of a disused burial ground in Hoxton, the enclosure at Portland Place, New Kent Road, and some small City churchyards, provided that proper arrangements were made in each case for maintenance. In response to the appeal of the association, a reply was received from the Rev. Harry Jones, the rector, to the effect that so far as he was able he had, in giving up a strip of the churchyard of St. Peter Cheap for the widening of Wood Street, safeguarded the existence of the fine plane tree at the corner of Cheapside and Wood Street. It was agreed to communicate with the Corporation asking that body to take care to do nothing which would injure the roots of this unique tree.

Children's Geranium Club.—Amongst the many organisations of which Cambridge House Settlement, Camberwell Road, is the centre, there is a children's geranium club, embracing some seven hundred members. In the early part of the year a geranium cutting was handed to each member, proper care being taken to prevent cheating, and each child was invited to cultivate the plant and exhibit it at the show. That the interest of the children was thoroughly aroused is shown by the fact that the seven hundred cuttings were represented at the show held on Monday by six hundred and seventy grown plants. The geraniums were used in the floral decoration of the large hall, which was also embellished by many choice plants kindly supplied by Messrs. Segar and Wills, of South Kensington. The show was opened by the Duchess of Devonshire, who also distributed the prizes to the successful competitors.

Messrs. J. Laing and Sons, Forest Hill, specially distinguished themselves on the occasion of the recent visit of H.R.H. the Duchess of Albany to Camden Park, Chislehurst, in aid of the Royal Deptford Fund. In the floral tent the firm arranged a magnificent trophy of palms and flowering plants, with hanging baskets of ferns, &c. Carnations, orchids, streptocarpuses, and begonias made fine displays elsewhere, as also did a collection of bouquets and fancy floral designs. The Messrs. Laing placed large standard bays and giant dracænas as an approach to this tent; they also decorated the duchess's tent with myrsiphyllum and white flowers and made the presentation bouquet. Her Royal Highness expressed her admiration of all the productions of the Forest Hill firm.

The Potato Crop in the United Kingdom is on the whole somewhat more satisfactory than at the corresponding period of last year. In England the crop is about equal to that of last year, in Wales it is hardly so good, while in Scotland it is decidedly better.

The Co-operative Flower Show will be opened at the Crystal Palace on August 19, when Earl Grey will deliver an address to a gathering of workers in the co-operative movement. The exhibition will as usual extend over two days.

NEW PLANTS, FLOWERS, FRUIT, AND VEGETABLES.

VIOLAS.

THE trial of violas at Chiswick was examined by the Floral Committee on the 5th inst., when the following varieties received three marks (× × ×), which may be regarded as equivalent to an award of merit :—

Miniature Wragment, a dwarf growing and free flowering rayless viola; flowers palest cream colour, well formed and very fragrant; a rather large miniature form.

Diuna, very dwarf but robust; flowers large, bright rosy-lilac; lower segments shaded with white at the base, and having a few violet rays.

Jackanapes.—This is a popular viola in many gardens by reason of its freedom of flowering, dwarf habit, and bright blooms; the latter have the two upper petals rich crimson, and the others yellow.

J. B. Riding, a handsome viola as long as it keeps true; dwarf in habit and free flowering; flowers of good shape, rosy-plum colour, very effective.

Sir Robert Pullar, a splendid bedding variety of robust habit, and producing plenty of large purplish-blue flowers that are carried well above the foliage. The foregoing were received from Mr. Forbes, Hawick, N.B.

Countess of Hopetoun, one of the best of the white violas for bedding purposes, good constitution; flowers abundant and of good shape.

Bullion, a very dwarf and compact habited viola producing an abundance of medium sized deep golden-yellow flowers, rayed with very dark crimson.

Marchioness is a beautiful viola with soft white flowers that have a yellow eye; the habit is good, the flowers large and freely borne on long stalks; a grand bedder.

Mrs. H. Bellamy, a handsome form with rounded flowers; three lower segments deep violet; two upper ones violet at the base, but with a very pale blue border.

Iona, an effective viola, dwarf and free, upper segments blue with darker veins; side segments blue with violet basal blotches; lower segment violet with a central blue segment.

Mrs. C. F. Gordon.—This is coloured much as is Iona, save that the blue is very pale, almost lilac in some flowers.

Duchess of Fife, a free flowering fancy viola, upper segments creamy, bordered with blue, three lower segments yellow, with a very irregular blue border; very showy.

Hamish, a pretty viola with rounded flowers; the three lower segments are deep rosy-purple, the upper segments much paler.

Princess Louise, a dwarf grower, but producing a profusion of soft canary yellow flowers that are mostly rayless; flowers rather small.

Blue Gown, a splendid bedding viola of very dwarf habit, fine for carpeting. Flowers soft blue, freely borne just above the foliage. The foregoing ten were received from Messrs. Dobbie and Co., Rothesay.

LETTUCE CRYSTAL PALACE.

A large and early cabbage lettuce of the Drumhead type, but a fortnight earlier than that form. It produces fine solid hearts, crisp and tender, and of good flavour. Colour pale green, leaves with crenate margins. A.M., R.H.S., July 5. Messrs. Watkins and Simpson, Neal Street, Long Acre.

STRAWBERRY REWARD.

A second early strawberry of moderate growth, producing, this season, a moderate crop of medium-sized oblong fruits that are bright scarlet both outside and in. The flavour is very fine, reminding one of the pine. A.M., R.H.S., July 5. Messrs. Laxton Brothers, Bedford.

PEAS.

Thos. Laxton.—This is a straight-podded variety with well-filled pods of wrinkled deep green and very sweet peas. It is a good cropper, early, and grows about three and a-half feet high; haulm strong. A.M., R.H.S., July 5. Messrs. Laxton Brothers.

Drummond's New Pea.—A heavy cropping early pea, bearing pods in pairs; peas bright green, sweet, and highly flavoured. Moderate in growth; about four and a-half feet in height. A.M., R.H.S., July 5. Messrs. W. Drummond and Sons, Dawson Street, Dublin.

Veitch's Acme.—This grows about three feet high, and has produced a very heavy crop at Chiswick; the pods are in pairs and well filled with large deep green peas of excellent flavour. The variety was produced by crossing Stratagem and Veitch's Extra Early. A.M., R.H.S, July 5. Messrs. J. Veitch and Sons, Chelsea.

STRAWBERRY VEITCH'S PROLIFIC.

A good mid-season strawberry, vivid scarlet in colour, wedge-shaped, and of large size. It is a grand cropper, and produces luscious, highly-flavoured, white-fleshed fruits. The variety is the result of crossing British Queen with Empress of India. F.C.C., R.H.S., July 12. Messrs. J. Veitch and Sons, Chelsea.

SENSATION CUCUMBER.

A fine cucumber, much fleshed, of good size, and blunt ended; previously described in these columns. F.C.C., R.H.S., July 12. Mr. S. Mortimer Rowledge, Farnham.

ROSE EDITH TURNER.

A beautiful h.-p. rose, with large, slightly-pointed flowers of a delicate blush colour, and deliciously scented. The petals are very broad and full, margins rounded. A.M., R.H.S., July 12. Mr. C. Turner, Slough.

ROSE PERLE DES ROUGES.

This is a beautiful polyantha rose, exceedingly free-flowering and producing much-branched clusters of rich crimson flowers, the bases of the segments being shaded with deep rose. A.M., R.H.S., July 12. Messrs. W. Paul and Son, Waltham Cross.

ASPLENIUM ORNATUM.

A very handsome dwarf-growing spleen wort, with very deep bronzy-green fronds, that have the pinnæ deeply laciniated; this is a fine form for use as a table plant, and its appearance suggests that it will last well. F.C.C., R.H.S,, July 12. Mr. H. B. May, Edmonton.

SWEET PEAS.

Aurora, a very bright pink variety, with large bold standard, veined and streaked with red.

Golden Gate, a pretty hooded form, with several shades of blue in the standard and wings; keel tipped with pale greenish-yellow. A.M., R.H.S. to each, July 12. Mr. F. S. Foster, Havant.

ABIES PUNGENS GLAUCA PENDULA.

This is a graceful drooping form of the now fairly well-known glaucous variety of Parry's abies or Abies pungens. The glaucous hue is finely developed, and altogether the plant is a most beautiful one, and a variety that should become deservedly popular. F.C.C., R.H.S., July 12. Messrs. Koster and Co., Hollandia Nurseries, Boskoop, Holland.

CARNATIONS.

Sundridge, a lovely soft crimson-scarlet variety with flattish flowers composed of broad and rounded petals. A.M., R.H.S., July 12. Mr. F. Tapper, Sundridge Park.

Nell Gwynne, a fine and full white carnation, free in habit, and with crinkled edges to the petals. A.M., R.H.S., July 12. Mr. J. Douglas, Great Bookham, Surrey.

Mrs. Martin Smith, a magnificent malmaison carnation with huge silvery rose flowers that have broad petals of the finest substance. The habit of the plant is good, both strong and free.

Calypso is another of the Hayes seedlings, a malmaison carnation of the finest quality having fine big white flowers with the petals delicately veined and marked with deep red. A.M., R.H.S., to each. Mr. C. Blick, gardener to Martin R. Smith, Esq., Hayes, Kent.

KALANCHŒ FLAMMEA.

This new succulent has been referred to in our columns (G. M., August 14, 1897, p. 497), in connection with its flowering for the first time at Kew. The species was discovered by Mrs. Lort Phillips and Miss Edith Cole in Somaliland, and they sent seeds to Kew in May, 1895. The plant is dwarf, as compared with some other species, growing only about a foot high; the stems and the obovate leaves are pale-greyish green, the latter being about three inches long by nearly two inches across. The inflorescence is a terminal corymbose cyme, four to five inches in length and breadth, bearing a large number of flowers, each half an inch long by three-quarters of an inch across; tube pale yellow; spreading, four-lobed mouth, vivid orange-red. Kalanchœ flammea appears likely to make a more popular plant, horticulturally, than any of the other species cultivated. *Bot Mag.*, 7,595.

AUSTRIAN BRIARS.

AMONGST all the real old-fashioned summer flowering roses, none are so beautiful and distinct as the Austrian Briars, and although they may claim to be amongst the earliest roses cultivated in our English gardens, yet even to-day we have no varieties that excel them in the beauty of the colouring of their flowers. Some twenty years ago these briar roses had almost gone out of cultivation, and were only occasionally found in old gardens and seldom seen quoted in rose catalogues; indeed, the writer well remembers a bunch of the Copper variety being exhibited at one of the Royal Horticultural Society's meetings, when at least one well-known rosarian acknowledged that he had not seen it before. Now, thanks to the growing taste for garden and old-fashioned roses, which has been helped by the classes introduced, and the exhibits at the National Rose and other shows, and these and many other beautiful old varieties, which had almost been forgotten, are again being fairly distributed amongst rose collection.

Of the Austrian Briars, as generally known, there are four varieties —two single and two double forms. The single varieties being Rosa lutea, the Yellow Austrian Briar, and Rosa punicea, the Copper Austrian Briar. These two varieties have been known in England for upwards of three hundred years, and are also found growing wild in some parts of Europe. Rosa lutea is of a beautiful clear, rich shade of yellow, quite distinct in shade to any other single or double variety. R. punicea, the copper-coloured variety, is of a coppery orange-scarlet in colour, with shaded under petals, the tints running one into the other, so much so that it is difficult to describe the gorgeous blending of those rich colours which make this one of the most distinct roses known. Both of these single varieties flower very early, sometimes soon after the middle of May, and when grown in quantity are most useful for supplying cut flowers, the unique shades of colour rendering them most popular with ladies for vases and table decorations.

The double varieties are Harrisoni and Persian Yellow. Although known as Austrian Briars, neither of these varieties originated in Europe. The first named was raised in America, and is said to be a cross between Rosa lutea and a Scotch Briar. It was introduced in 1830. In colour it is of a fine clear golden-yellow. The Persian Yellow was sent to England from Persia by Sir Harry Willock in 1837. It is deeper in colour than Harrisoni, not quite so large, but more double.

The Austrian briars are extremely hardy, and do remarkably well with proper treatment, in the most exposed positions. They may, perhaps, prefer a dry soil. One occasionally hears complaints of their not flowering, and this in most instances is to be traced to want of care in pruning. These varieties, like many other summer-flowering roses, should not be pruned at all in the spring; it must always be borne in mind that they bloom entirely upon the growth made the preceding season, and even to top the shoots is to cut away the flower. Immediately after flowering is the time to prune, the old shoots should then be shortened, some of them cut away altogether, and fresh growth encouraged to form the flowering shoots for the following season's bloom.

All the Austrian briars are very effective for grouping and bedding where rich effect in early summer is desired. Clumps of three or four of a variety planted together, and the long shoots pegged down, will flower from every joint, and are most showy in the rose border. Tall standards of all the varieties, with the shoots tied to wires to form weeping roses, are very novel and striking; and even as pot plants for late spring flowering in the conservatory, if suitable plants with long shoots are selected in the autumn and potted, the shoots being bent and tied round small stakes, beautiful little specimens, which will be covered with flower, may be had in March and April.

Bath. W. F. COOLING.

A MORNING MIXTURE.

Diluculo surgere saluberrimum est.

It is not often that I indulge myself in a course of preliminary pen-biting and thumb-twiddling when I sit down to write, but on the present occasion I find myself labouring under as severe an attack of that juvenile malady as ever I had in my novitiate. The reason of this, if you please, is nothing more nor less than a pull-devil, pull-baker contest as to whether I shall or shall not touch on roses at this particular season. His satanic majesty suggests that everybody must by this time be heartily sick of roses, while the floury one stoutly contends that as the season is yet far from through, rosarians have only got their appetites nicely whetted. Between the two of them I am at a standstill.

On the whole, I am inclined to let the specialists have their innings. If they cannot write about roses ever so much better than people who are not specialists they think they can, which comes to about the same thing. And this reminds me what a humourous study is the attitude of the specialist towards the non-specialist when the latter ventures on the sacred preserves. Sometimes it takes the form of jocular scepticism, sometimes of good-natured toleration, sometimes of genial indulgence, sometimes of tremendous sarcasm, but never of serious attention. It is not so long ago that I had a great rosarian in my garden, and to him I ventured—greatly daring—to address a few comments on rose practice which are not in the rose books. He listened with a bland and beaming abstraction, said "Dear me!" at the end, and immediately afterwards began to talk with great animation to a young solicitor who had won a fourth prize at a local show, and was, therefore, one of the elect. And what do you think was the burden of their eager converse? Whether my pet A. K. Williams would rank as a one or a two point flower! This about a bloom which I honestly believe would have won the medal at the National was too much.

Perhaps, however, this sort of thing is only a just Nemesis. Outsiders always say that horticulturists look down upon them from a higher plane of being. Therefore, when the camp sub-divides and one section looks down on another, the same principle is being applied to the sinners themselves. It is capital sport to beguile a rose specialist, who has been lording it over you, into a carnation or chrysanthemum show, introduce him to an enthusiast, and leave him to his fate. If he be an all-commanding floricultural genius—an F. D. Horner, let us say—he may come through the ordeal triumphantly. But F. D. Horners are few and far between, and as a rule he has a bad quarter of an-hour before the hollowness of his pretensions are exposed.

Let me hasten, however, to something practical, lest trouble befall me. Some time ago, after venturing on a few brief reflections, which hadn't any particularly practical end, I was admonished by a post-card, which was somewhat to the following effect: "Look here! If you are 'Lux' stop that fancy jaw and give us something sensible." The young recipient was not the time-worn Lux, but he contrived to get this painful thrust passed on until it reached the right party, who, happening to have taken professional pride in the matter thus contemptuously derided, was badly mauled. My first practical point is about strawberries. I have said so many good things about Royal Sovereign that I cannot be said to have a bias against it in giving utterance to a bad one. It is not altogether pleasing many of the chief market men, and this because it matures so rapidly that unless they can tackle it all at once it is gone. Paxton's develop more gradually, and are therefore more convenient for gathering and marketing. It looks from this as though the process of displacement which was going on between the two great rivals may be checked. Any way, large growers may thank me for the hint to proceed with caution in extending one at the expense of the other.

The Editor deals with the delicate subject of lawns in a recent note. I choose the adjective purposely. Trimness is not everything in a lawn. You may shave some lawns as rigorously as you do your own chin of a morning, and they never possess that indescribable fineness and delicacy which a perfect lawn exhibits. The perversity of people on this subject is very remarkable. I could not help wondering, as I read of the gentleman who objected to freshly turf or seed his plot on the score of expense, but fell readily in with the reserve plan of mending it piecemeal, how much he was in pocket when the grass was at last put into respectable condition. This lawn-patching is doubtful economy. It is not so much the odd bits of seed nor the odd bits of soil which cost money, as the time consumed in the fetching, carrying, and applying. However, his refusal to do the thing thoroughly had an advantage for the public if not for himself, for it enabled an instructive experiment to be made. The mention of phosphates reminds me of a wonderful crop of hay just garnered by a friend who adopted a suggestion of mine to dress with steamed bone flour. It is, indeed, a remarkable crop, even in what is recognised as a good hay year. The Editor mentions "bone meal." Perhaps that would be better still as containing rather more nitrogen.

Mr. D. T. Fish writes, in his usual interesting way on the subject of "fruit production." I got along capitally with him (as I nearly always do, by the way, either in the press or in person), until I came to the last paragraph, and then I began to sniff powder. Fruit trees, says Mr. Fish, suffer more from want of water than want of food, and then he proceeds to say that drought at the roots shrivels off thousands of blooms and embryo fruits. Wrestling with a slight ambiguity of expression, I came at last to the inevitable assumption that drought is suggested as a leading cause of imperfect setting and swelling. But I ask, When has fruit gone off as it has done this year? And when have we had a more saturating spring? It must be many a year since the two things have run in a more significant double harness. In all my experience I have never known a more disastrous sweep of all classes of orchard fruit as 1898 has presented us with. How, therefore, anyone can advance drought as the cause passes the comprehension of ordinary mortals, and even transcends the massive intellect of that heaven-sent genius, Peter.

Peter, let it be known, has a theory of his own. You remember the story of the journalist who determined to thwart the cunning scheme of the policeman who desired to keep midnight skulkers off the seats in the square. Robert soused the seats with water, but when he saw a respectable newspaper man there he was obliged to hold his hand. However, he routed the interloper with the whispered warning "insecks." Similarly, when I asked Peter to give his views on the question of fruit loss in or just after the blossoming stage, he responded—"insecks, sir." Peter points to the excess of blight this year, and expounds his theory with such unbounded conviction that I know it is useless to argue with him. I weakly imagined I had presented him with a poser when I pointed out that the imperfect bloom was there before the insects, but he shattered this by asserting that the flowers would have stiffened up right enough if the blamed varmint would have let 'em; he'd known 'em do it many a time. What can I say to this?

It no doubt pleases "A.D." to ask for the papers of the "senior wranglers" in horticulture, whose names have been recently published; but it would have been more to the point if he had suggested that there should be an examination in practical work. I shall not recapitulate former arguments in favour of this cause. Suffice it to say that such arguments have been advanced and never refuted. I do not know that I should refer to the matter at all, well aware though I am that I have a strong mass of opinion behind me, were it not that some people construe my attitude into one of hostility to the principle of theoretical study root and branch. Rubbish! What I contend for is a happy harmony of practical skill and intelligent scientific aptitude. It may be difficult of attainment, but it is certainly not impossible. Now, with a mere paper examination you can never be sure you are turning out the right material. A skilful crammer may upset all your calculations. On the other hand, while an examiner is putting a series of candidates through a practical test, he can ask for reasons for each task, and so test theory at the same time.

LUX.

ROSES IN DECORATIONS.

As far back as we have any history of the rose, it has been one of the most popular of flowers, and one used most extensively to decorate the festive board and hall at the principal public and private gatherings of those nations in whose lands it grew freely. The rose has ever been admired by those who loved beauty of form and colour, and delicious fragrance, consequently we find that at the present time roses enter more largely into the composition of floral designs than they ever did. This is not to be wondered at when we consider how rapidly the taste in floral designs and decorations has advanced and improved during recent years; then, of course an additional incentive to the popularising of the rose for bouquets, baskets, table decoration and personal adornment, has been the continual increase in the number of delicately-tinted roses possessing fragrance. Indeed so wide is the colour range we now possess in roses, so numerous the charming half-shades, and so exquisitely beautiful the combinations of colour seen in many of the noisette tea-scented and hybrid tea roses, that there can scarcely be anyone who cannot be supplied with a rose, or roses, suitable for association with any colour that may be presented by vase or basket, furniture or dress.

Roses were never more popular than now, especially for bridesmaids' bouquets, and for presentation baskets. What could be more effective than a combination of yellow roses with those that have a brownish shade, providing they are tastefully disposed amid bronzy foliage. It would also be difficult to imagine a prettier combination than that of the lovely pink Catherine Mermet with the rich crimson Duke of Wellington. Such combinations as these suggested are more generally admired than are baskets or bouquets of any handsome self-coloured rose, such as Mrs. J. Laing, Captain Hayward, Caroline Testout, Ulrich Brunner, A. K. Williams, Viscountess Folkestone, or Her Majesty, to enumerate only a few of those that are eminently suitable for floral decorations without the assistance of other varieties. Some of the self-coloured roses make charming displays when associated with white variegated, pale green, or bronzy foliage, according to their colour; thus pink roses and white variegated foliage go well together.

The greatest difficulty floral designers have to contend with in the use of roses is the lack of substance and rigidity in the stems. It is a great pity that so many of our most beautiful roses have such weakly stems and need to be wired, this process somewhat affecting their charm. Niphetos, Maréchal Niel, Safrano, and L'Ideal are sinners in this respect, and florists would be grateful to those who would raise varieties similar in colour, but producing flowers on long stiff growths. We want, for floral decorations, more roses of the class so ably represented by The Bride, Catherine Mermet, Bridesmaid, Captain Hayward, &c., for not only would such prove a great help to decorators, but they would prove much more effective when cut, and used unmounted, with long stalks, than those with limp stems, and which have to be wired into position.

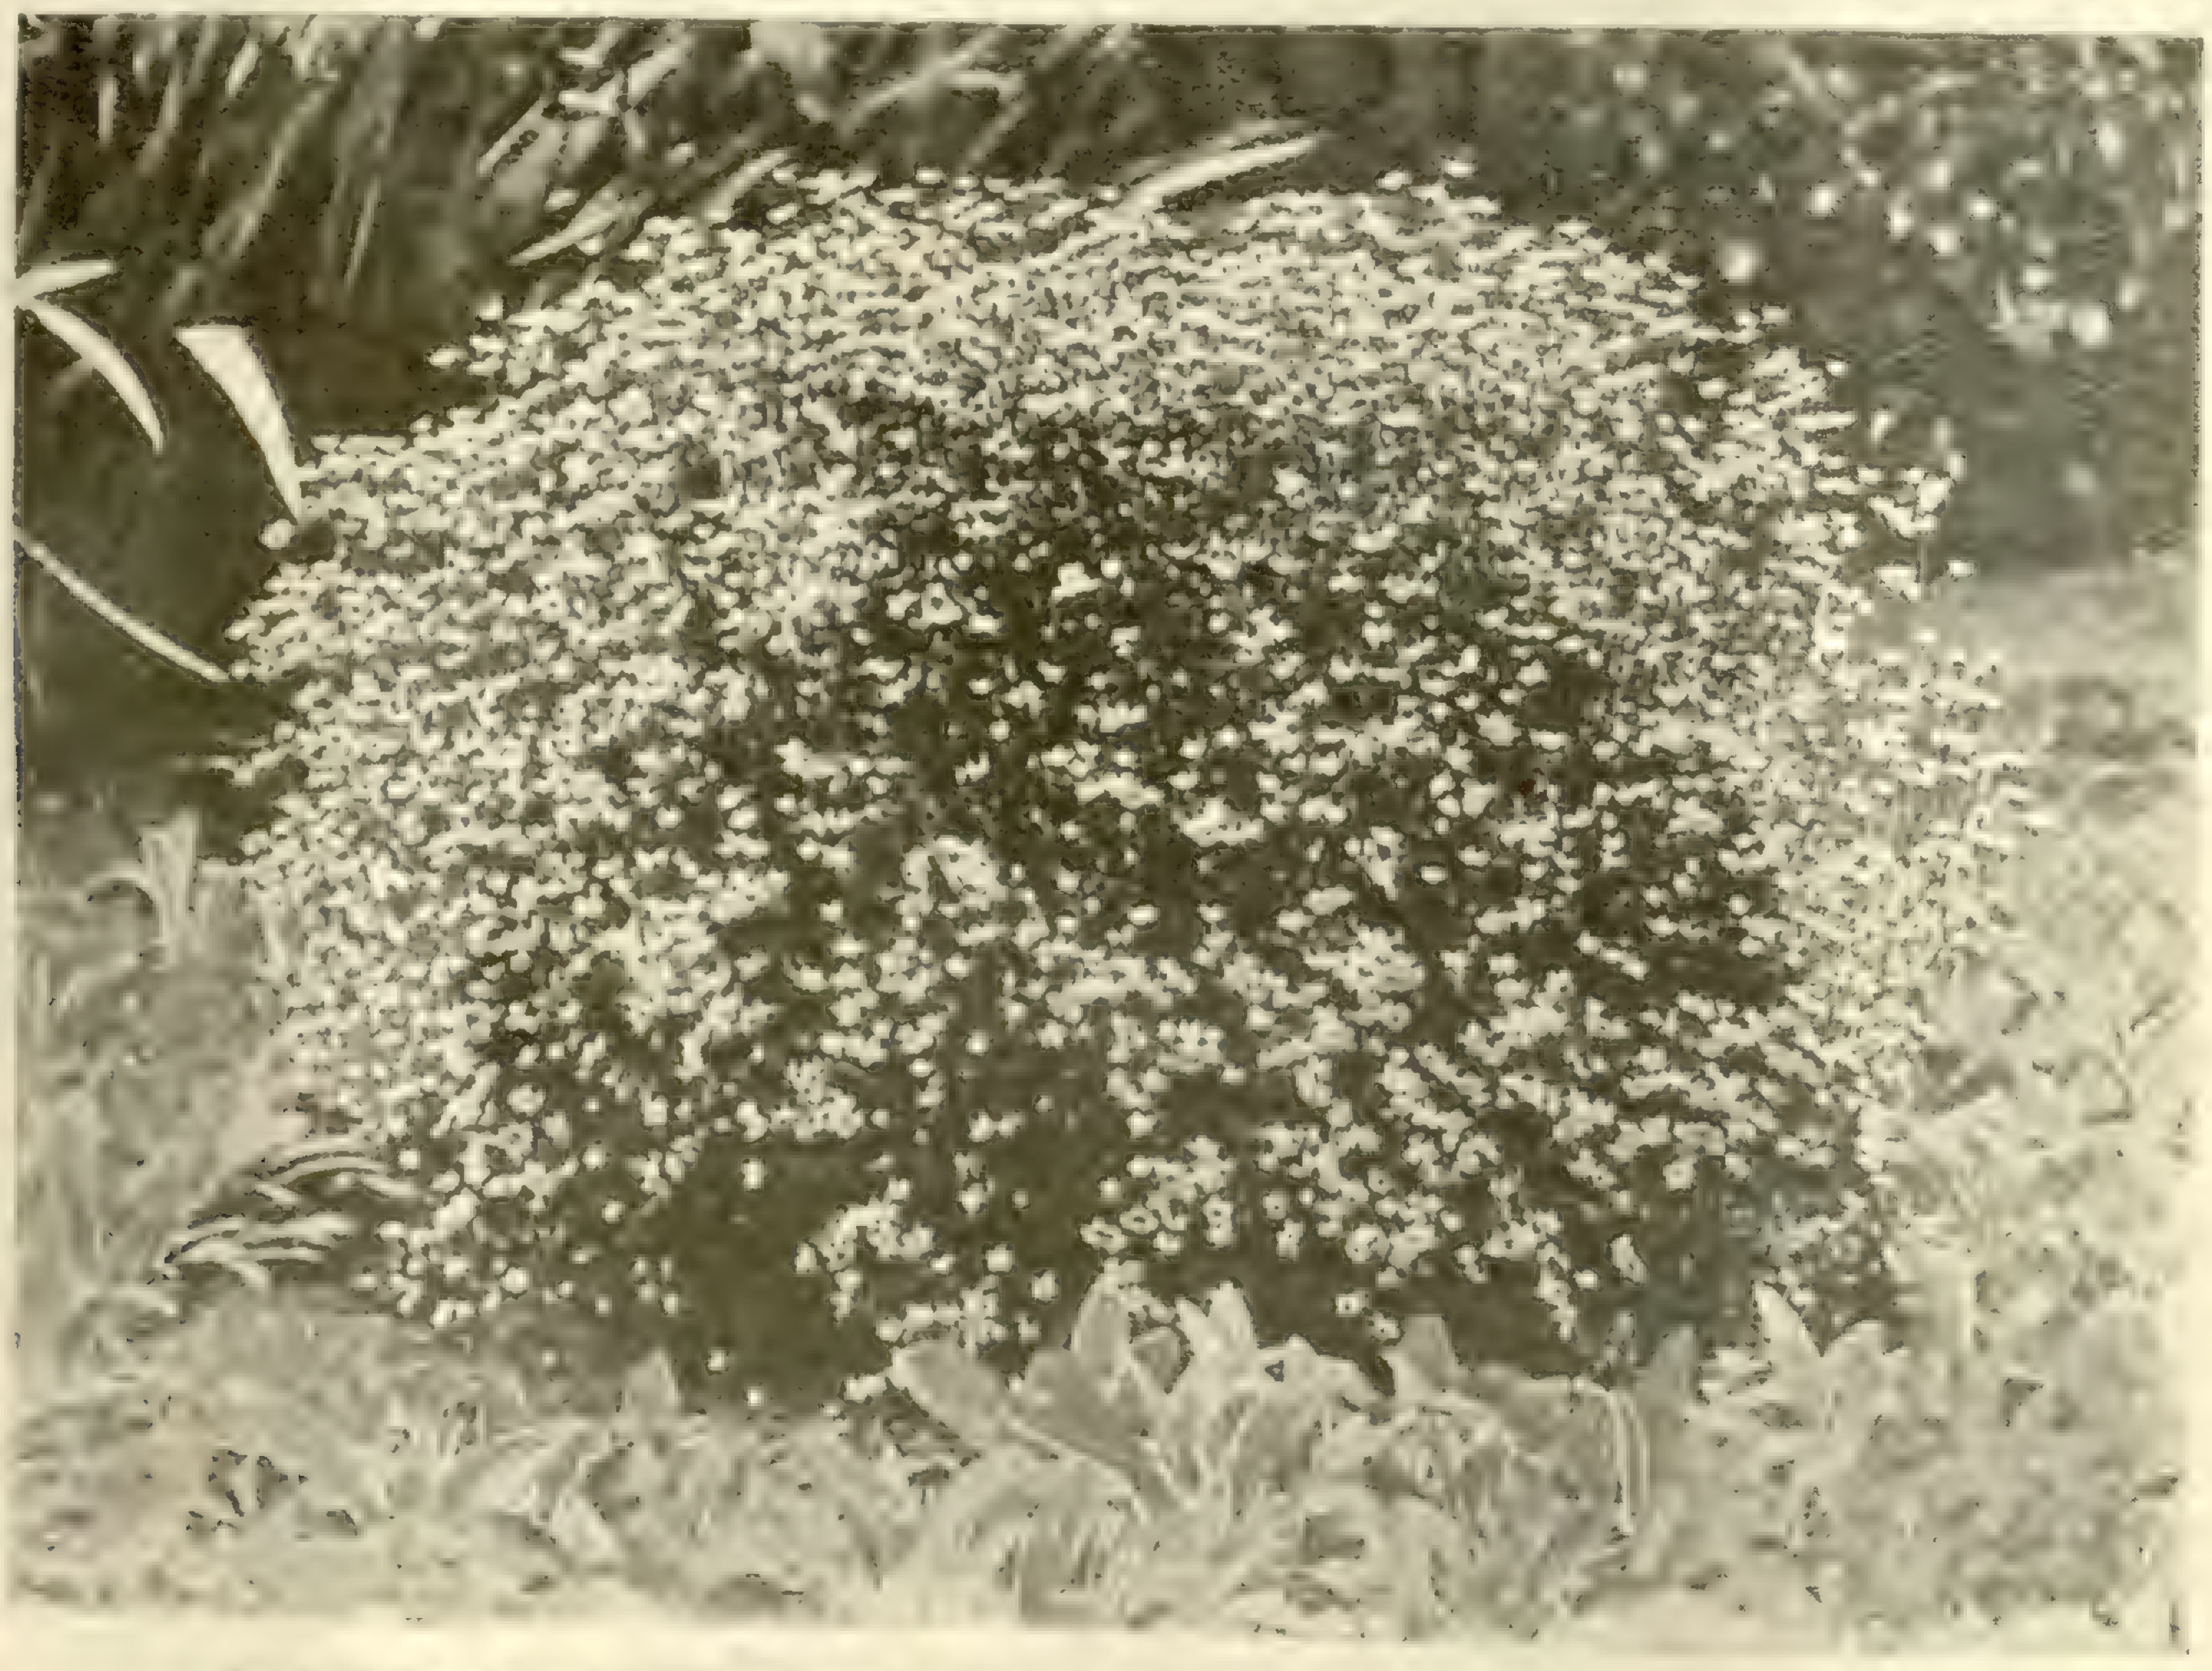
That comprehensive section known as garden or decorative roses, contains many varieties that are of the greatest possible use in making up bouquets, corsage and hair sprays, buttonholes, &c., for in the bud state they are surpassingly beautiful and easily manipulated. A few of the best include W. A. Richardson, L'Ideal, Homere, Madame Chedane Guinoisseau, Ma Capucine, Safrano, Laurette Messimy, and Coupe d'Hebe.

Coventry.

H. A. PERKINS.

SAXIFRAGA HYPNOIDES.

One of the prettiest and most easily grown of the mossy saxifragas is the British species S. hypnoides, known as the Dovedale Moss, or Eve's Cushion. It is a very variable species, so much so that some of its forms have at times been described as species. Sir J. Hooker, in his "Students' Flora of the British Isles," writes: "I have repeatedly studied the forms of S. hypnoides and its allies, and always with the result that the passage from hypnoides proper to cæspitosa is undefinable." In the higher hills and mountains of Somerset this saxifraga is fairly common, but it is more abundant in the highlands of Scotland. Apart from its effectiveness when in flower, S. hypnoides is a most useful rock plant because of the dense mossy growth it produces, which is of a lively green hue throughout the winter. In country gardens one may often see the species used to cover the front of a low rockery, especially in cottage and villa gardens. It is not at all particular as to position, but it prefers an exposed, or at least a half-shaded, position, whether grown in a rock garden proper or in a butter tub, as shown in the illustration. The specimen figured is the pride of a good lady whose villa garden in the Canterbury Road, Croydon, contains many homely plants well grown. It is planted in a butter tub, and has flourished so well that the tub is completely hidden by the overhanging mass of mossy growth. When in full flower during June and July there is a mass of white blossoms that draws the attention of every passer-by, and probably the majority never for one moment think that the plant that delights their eyes is a native of our own land.



SAXIFRAGA HYPNOIDES IN A BUTTER TUB, AT CROYDON.

SHEAVES OF ROSES.

The question of exhibiting garden roses should prove a popular and useful subject for discussion in your columns, if room can be spared. That mass is might to win prizes seems to have caused the piling up of not a few sheaves of garden roses. When these classes were introduced not a few expected a great and decided development in the display of roses with artistic effect. These brilliant ideals have been doomed to serious disappointment. A few very creditable exhibits of garden roses have been made, but on the whole the last efforts of showing roses artistically have been worse than the first. When showing rose blooms singly the beauty, merits, or faults of single flowers not only could, but must, be seen by every open eye; but by showing garden or other roses in sheaves individual merit is hid, and no one can see the natural grace, form, or artistic beauty of the trusses because of their numbers. The more trusses in a bunch or sheaf of roses the less can each assert or show its individual graces or charms. As you point out in your recent editorial note, the National Rose Society stipulates that not less than three trusses of one variety shall be shown in a bunch of garden roses. It would be just as easy to add that not more than five trusses of any one variety shall be shown in a bunch. I prefer five to seven or any larger number of trusses, for the reasons already stated.

But the mere number determined upon is of less account than the fact that a definite minimum and maximum number of trusses should be insisted on throughout the entire class. Thus, so far as possible, placing all growers and exhibitors on a level of justice and opportunity. According to present rules, or lack of rules, the biggest growers have the prizes very much in their hands, and even this is a far less evil than this lumping on the show tables of garden roses through crowding ponderous sheaves of unlimited numbers of trusses. There are yet two other possible methods of checking this evil, worthy of consideration. One is to make the minimum limit of number of trusses of garden roses the absolute limit—three perfect trusses of a garden or other rose, would reveal its habit, character, and beauty, just as well as five, as if all were limited to three, there could be no hardship to any. The larger grower would still have his legitimate advantage in his wider field of choice for his best trusses.

There might also very properly be a class for single trusses of garden roses. Just because these roses differ so materially in size of truss and individual blooms, such a class would prove of great interest and educational value to the public at large. As I have said, over and over again, our present systems of showing hides individual merits and demerits under the blinding shelter of mere mass. This may give telling blazes of colour, or masses of verdure, but often leads intending planters widely astray as to the individual merits of species or varieties of roses. But exhibit each rose in single sprays or trusses of sufficient length, and place them sufficiently far apart for each to be seen clearly, and he who runs, or walks through the show tents, may read off their merits at a glance. Thus our best shows of roses would not degenerate into mere spectacular displays of colour for an hour or a day, but become schools of learning.

Edinburgh. D. T. Fish.

PEACHES OUTDOORS.

I feel compelled to respond to the remarks of "D. T. F.," given on page 422 of the Gardeners' Magazine, where he comments upon my methods of procedure in peach growing. I am very pleased to tell "D. T. F." that in spite of my unorthodox style (as he terms it), I have a lovely lot of fruit, the trees are the picture of good health, and I shall be pleased for him or anyone else to see them. The trees do not look as though they had been treated very badly, or on any "erratic" system. I must point out that in my letter of May 14, I did not write two ounces of carbolic soap, but two pounds, that is just thirty ounces different; and also add that my practice of cleansing at the start is quite justified by results. The reason I use warm water is that it is one hundred per cent. more effectual upon insects than cold; I thought most practical gardeners knew that; rose growers do. We start washing the trees early in the morning, say, at ten o'clock, so that they are nicely dry before nightfall. Nothing at all is gained here by leaving any protection over the trees after May has come in; in fact, it does more harm than good. What is the covering put over for but to protect the blossom? So, after that is safe, the less coddling the trees receive the better. It is at this stage that the trees become badly crippled, and are almost certain to be infested with aphis, which must be eradicated before the trees will start into growth. I have this season seen trees badly crippled through this cause.

On several occasions I have expressed in these columns my opinions and experience with reference to disbudding, but I do not remember ever stating that this operation should be performed in one act, quite the reverse. I have said that disbudding should be commenced very early, as soon as the shoots can be handled, and I adhere to that system, for from my own experience it is the most advantageous, as it certainly gives a better chance to those shoots left, to say nothing about the fruit. I have been wondering what the trees would look like after having been covered up with bracken, asparagus tops, or other thick material, and this close on the tree; and how is it possible for trees to be healthy under such conditions? I consider a fish net a much more effective method, and put two feet away from the wall, one can walk under and examine the trees. This is not much covering, but it is effectual, and further proof is not necessary. I have grown peaches here for ten years, and have never yet had a failure either in or out-of-door crops. When I took charge I was informed that peaches would not do here, but I was allowed to make a fresh start, and the results have been gratifying to all concerned.

Combton Bassett, Calne, Wiltshire. W. A. Cook.

THE QUEST OF THE BLUE ROSE.

THE rose has been justly described as one of the grand prodigalities of Nature; and the poetry and romance of Europe and the Orient have awarded it the first place in the world's wide garden. In his own manner, Herrick tells us that it was in a floral parliament—sitting, no doubt, in "the month of roses"—that the rose was voted the Queen of Flowers. Man has ungrudgingly accepted her sovereignty, but for ages seems to have been haunted by the idea of changing the contour and colour of her diadem. Following in the footsteps of Baptista Porta he seeks to add yet another shade to the damask beauty whose natural graces are deemed inadequate for exhibition and prize purposes. It goes for little that we have had a "black damask" rose for so many years that it is quite out of date; or that we have many varieties whose splendid depth of colour seems to shade into blackness. A Russian rose-grower has, as all the world has just been assured, succeeded at last in producing a black rose. The news may stand for what it is worth; and, leaving this particular flower of Erebus to the care of its cultivator, it is, a writer in the *Globe* so well states, more interesting to turn to the line of the true quest—the aspiration for the rose that shall be "darkly, deeply, beautifully blue."

Now, the rose-grower is subject to so many natural disquietudes that it would seem to be a sheer act of folly gratuitously to add to them. In some seasons the "green fly" alone is enough to deprive him of his natural rest. Then there are the recondite points of arbitrary excellence to which—if he aspires to fame—his blooms must strictly conform. Finally, he falls under the potent spell of the colour mania, in regard to which he realises the truth of the axiom that "Man never is, but always to be blest." Though there is no authentic record of the "issue" of a blue rose, it is not for want of the most strenuous and long-sustained efforts on the part of the seekers. Considering that the quest dates at least from the time of the Moorish dominion in Spain, and that the experimentalists are still busy, few will grudge them the solace of hope. Moreover, the search may be said to be animated by the impulse of perpetual youth, which manfully takes up the running as the elders drop wearied by the way—

> "Youth, a breeze mid blossoms straying,
> Where hope clings feeding, like a bee."

The bee is admittedly the florist's greatest natural ally: but even his active industry has not yet availed in hastening the era of the blue rose. Scientific men, indeed, declare that the bee has an instinctive preference for blue flowers; though he is too busy and practical an insect to attempt their production on his own account. If any comfort is to be found in didactic quotation the rose-grower may experience it in the assurance that "all things come to those who wait." But, alas! it is not always the things waited for that come. A blue orchid has been discovered, and a blue dahlia has long been an object of desire. But the blue rose is admittedly the highest aim of the floral discolourist, simply because it seems to be the most difficult of attainment.

Probably the quest has been pursued with the greatest assiduity in France. Already our neighbours claim the "invention" of innumerable charming varieties, including the striped and the so-called black or purple rose; and paragraphs not unfrequently appear in their newspapers announcing the advent of "a natural rose of blue colour." But though the tint of a particular bloom may momentarily flatter the fond idea, the plant itself has hitherto declined to conform to the wishes of its cultivators. Not long since an eminent French florist offered a prize of 30,000 francs to anyone who could produce a plant on which blue roses would bloom. The terms of this offer were obviously intended to eliminate the mere "fakers" of flowers, who, by means of chemical agencies, often temporarily influence the colour of a particular bloom, or the tendency of a single plant to produce flowers of that shade. We know too well how easily the ingenious purveyor is enabled to modify the natural colour of milk. "Sky blue" is attained by a method of such rare and patriarchal simplicity, that it is impossible now to give the palm to its great originator. But the cow that shall voluntarily produce blue milk is yet to be discovered. So it is, happily, with the rose tree; and the prize offered by the discriminating Frenchman is still unawarded. Science so far declares that the quest is a vain one, and that florists are destined to "table" a blue rose only on the occasion when the Zoological Society exhibit their first phœnix. Nevertheless, the enthusiastic rose-grower will not take "no" for an answer. Flower crazes of all kinds are said to develop a well-marked kind of "ferocity" in the bosoms of their votaries; and we are assured that the amateurs of tulips have in their time been the most ferocious of all. But no mania has persisted for so long a period as that displayed in the quest of the blue rose. Nor is it "little men" only whom it has infected. Under the date of September 18, 1840, a book of French reminiscences says: "We had Balsac to dinner. He is quite mad. He has discovered the blue rose for which the Horticultural Societies of London and Belgian offer 500,000 fr. reward, and he will sell the seeds at 5 fr. each." Happily, Balsac had something better to do, and left the roses to their untutored ways.

If the Darwinian theory is correct, all flowers were originally green; and having through the vicissitudes of time, soil, and climate gradually whitened, have progressed through yellow into red. Comparatively few have achieved the final greatness of blue, and fewer still have allowed it to be "thrust" upon them. But "nil desperandum" is especially the motto of the florist, who still regards the blue rose as in some sort the "blue riband" of the floral world. It is many a year since Dr. Lindley told the student how a blue flower will change to white or red, though not to yellow; and that a bright yellow flower will become white or red, but never blue. Nature is, in fact, parsimonious in blue, which is probably the main reason why the enthusiast is so desirous of imposing it. But though the blue rose has not yet arrived, green roses have been exhibited on several occasions. Of these, however, beyond being a nine days' wonder, nothing seems to have come; and they are probably a sign of floral degeneracy rather than advance. And if by any possibility the blue rose were obtained, it would seem more likely to revert to an early stage of its colour development than that the imposed shade should become fixed and inherent in its descendants. Gerard, the herbalist, records some of the attempts of a friend in this direction; but he soon comes to a pause with the significant remark that "to recount his experiments were to roll Sisyphus' stone, or number the sands."

The old-world gardeners used sometimes to plant rue, or other ill-smelling plants, near the rose, under the belief that they imparted to it a sweeter perfume. But the scientific floriculturist who seeks to influence the colour of flowers works by much more recondite means. Instead of a potting-shed he requires a laboratory. His "stimulative agents" include several of the salts of iron and zinc, arsenic, ammonia, sulphuric ether, picric acid, and some of the aniline series of dyes. Alum and iron filings are frequently employed, and by some of these, or by other means, he has given us primroses of "slaty blue," and has even succeeded in bestowing a "blueish" tint upon other flowers which only too plainly resent the treatment. A native rose found in the Philippines is said to be pure white from dawn to about ten, when it begins to turn pink, until by five o'clock it is of a perfect rose colour. It seems a pity that it cannot change to blue by sundown. Then the "blue rose man" would be freed from the incubus of his quest, and might in time learn to say with the poet—

> "I'll take the showers as they fall,
> I will not vex my bosom;
> Enough, if at the end of all,
> A little garden blossom."

BUTTON-HOLE ROSES.

IN the year 1885 the committee of the N.R.S., at their metropolitan show, introduced a class for buches of roses suitable for button-holes. No doubt my having had an unbroken record of success as an exhibitor in this class from that time accounts for our esteemed Editor's request for a few notes on the subject of "Button-hole" Roses. It is a pity that other societies have not followed the N.R.S. schedule, for as with garden roses, the lovely bunches of these pointed buds, gracefully arranged, make a charming addition to a show, and take off the stiffness created by long rows of cut blooms.

It must be admitted by all lovers of flowers that the rose is the universal favourite button-hole flower. Of all classes of roses the tea family, in my opinion, take the lead for this purpose, and for many reasons. They are almost the first to bloom, and are certainly the last to leave us. Again, it having been proved of late years that their constitutions are almost as hardy as many of the H.P.'s, they can be grown in any garden where the soil is warm and dry without being coddled in winter blankets, as was once thought necessary. Their many varied and delicate tints of colour and long, pointed buds also commend them. In giving a list of the varieties most suitable for button-holes I will not weary readers with a description of each variety. That can be easily obtained from any rose catalogue.

The following varieties are the best in the tea class: Amazone, Anna Olivier, Corinna, Isabella Sprunt, L'Ideale, Ma Capucine—this is probably the most beautiful of all the fancy coloured tea roses; the colour is very difficult to describe, being a bronzy yellow and orange-scarlet; very free-flowering, but a moderate grower—Madame Charles, Madame Chedane Guinoisseau, Madame Falcot, Madame Hoste, Madame Lambard, Madame de Watteville, Marie Van Houtte, Niphetos, the best white for growing under glass, but very few succeed with it outside; Papa Gontier, Rubens, probably the best of its colour, with exquisite long pointed buds, flowering and growing very freely with us; Safrano, Sunset, and W. A. Richardson (noisette), which is by no means to be despised.

The hybrid teas form a class that is rapidly coming to the front among roses generally, and certainly containing a few varieties very suitable for buttonholes, the following being the best: Camoens, Gustave Regis, Madame Pernet Ducher, and W. F. Bennett. The latter variety is very little known, but is a most reliable and early-flowering rose with us. Among the polyanthas we have two of our most exquisite miniature varieties, viz., Cecile Brunner and Perle d'Or. In the Chinas is found one of the best varieties in Laurette Messimy.

Coming to the H.P.'s, although this class cannot boast such a variety in form and colour as do the teas, still we cannot afford to despise them, as it is to this class we must go for those deep velvety-crimson kinds so much admired, and among which the following are the best: General Jacqueminot, Fisher Holmes, Victor Hugo, Prince Arthur, and Prince Camille de Rohan.

In growing buttonhole roses, no particular care is required in their culture; one thing should, however, be remembered, and that is, do not prune too hard, particularly such varieties as Marie Van Houtte, Madame Hoste, Madame Lambard, &c., these being exhibition kinds. To those who are not at all familiar with the growth and habit of any of the above varieties, and who intend planting during the coming season, I would recommend the following dozen as being very good, and certain to give good results: General Jacqueminot, Fisher Holmes, Papa Gontier, Laurette Messimy, Madame Lambard, Anna Olivier, Gustave Regis, Madame Chedane Guinoisseau, Madame Falcot, Madame Hoste, Rubens, and Marie Van Houtte.

Oxford. J. R. MATTOCK.

THE QUEEN'S DIAMOND JUBILEE CUP FOR ROSES.

ALL the rosarians who read the GARDENERS' MAGAZINE, and they are legion, will thank you for your representation of this handsome cup, which honours her gracious Majesty the Queen as well as the winner. After a severe contest Mr. Benjamin R. Cant has won the cup for two years in succession, and is now able to place it for good in the chief place of honour amid his marshalled hosts of these trophies that so richly adorn his beautiful home, environed on all sides with tens of thousands of roses. As an old friend and neighbour of Mr. Cant's for many years in East Anglia, who has noted with intense interest and pleasure his rise, progress, and brilliant success, will you kindly permit me thus publicly to congratulate him on this crowning victory of his great career. Most rosarians were disappointed to find the honoured name of the veteran B. R. Cant omitted from the Jubilee medallists. To hold the Queen's Jubilee Cup by his own merit is, however, a higher honour, and all his rose comrades and friends will join in wishing him long life and better health to enjoy his last and highest as well as his many other well-merited honours. In looking through the list of roses on page 417 one is delighted to find that the Queen's Cup, in the main, was won by old and well-established varieties, seasoned here and there with such novelties as Medea, Golden Gate, Helen Keller, Mrs. W. J. Grant, &c., and that among the older varieties, with a history of twenty three years, was Prince Arthur, one of the several fine roses introduced by Mr. Benjamin Cant, who always grew this, his favourite seedling, as he did so many other roses, better than anyone else.

12, *Leiter Row, Edinburgh.* D. T. FISH.

NEW HYBRID CYPRIPEDIUMS.

SINCE the discovery by amateur orchid growers that cypripediums could be cross-fertilised almost as readily as cucumbers, and be followed by seed almost as surely, there has been a tremendous lot of cypripediums raised. Unfortunately, during later years, very many of these orchids have been in no degree better than those previously raised, and there has been too general a use of the same species or varieties; the natural result has been that the variations have, broadly speaking, been slight, and a casual observer would think cypripedium hybrids and crosses of any distinction could not in future be obtained. Occasionally, however, a new and distinct cypripedium, artificially produced, makes its appearance, and proves that there are combinations not hitherto effected, while a study of the genus affords still further proof.

Two very distinct hybrid cypripediums were exhibited by Messrs. Hugh Low and Co., Bush Hill Park, Enfield, on June 28 last, and both received the award of a first-class certificate at the hands of the Orchid Committee of the Royal Horticultural Society. C. Mrs. Reginald Young is a remarkable production, obtained by crossing C. Lowi with the pollen of C. Sanderiana; it has a pale yellow dorsal sepal veined with rich brown. The petals stand out from the flower for a couple of inches before drooping, this making a wide arch; these are narrow, whitish at the base, blotched and spotted with purple that fades towards the apices into deep purple-brown. The short labellum is wide and full, rich burnished brown in front, shading to purplish rose behind. It should be added that the petals are nearly eight inches long and slightly twisted.

C. I'Ansoni is a splendid new cypripedium, with large bold flowers that betray their parentage. C. Morganiæ, itself a hybrid between C. Stonei and C. superbiens, was the seed parent of C. I'Ansoni, C. Rothschildianum being the pollen parent. The oblong-ovate dorsal sepal has a shining, whitish ground, tinted with rose, and on this are curving lines of blackish purple, composed of contiguous spots; the lines on either side of, and next to, the medium one are shorter than it by one half, the next beyond are longer, and so the lines alternate in length to the margin. The ventral sepal is about the same size, and almost as finely coloured as the dorsal one. The petals, drooping gracefully, are very attractive, they are fairly broad at the base, but narrow gradually towards the apex; the ground colour is palest green, with a suspicion of yellow, and on this are numerous claret-purple spots, some of them inclining to purple-brown. As already stated in these columns, C. I'Ansoni bears the name of a well-known orchid foreman at Messrs. H. Low and Co.'s nurseries. Both these new cypripediums are decided acquisitions, as a glance at the accompanying illustration will prove.

FRUIT PROSPECTS IN THE NORTH.

THE most notable crop of fruit in this district of Northumberland for trade purposes is the strawberry, and it promises to be more than an average crop. We have had some timely showers since the month of May, but no severe frost when the plants were in bloom. Yet the weather has been very changeable, with a low temperature. The strawberries are very healthy and in a vigorous condition, the earliest kinds ripening some fine fruits. Royal Sovereign has proved itself to be the earliest, and best that we know of. It is some days earlier than John Ruskin, and altogether finer, with a heavier crop. Last year we had an extra lot of plants layered in pots, and we planted them out a foot or so apart. These are now producing a splendid crop.

Of apples there are not large quantities grown for market, and the crop is irregular; some few kinds have heavy crops, others very light. It is rather early yet to say decidedly what the crop may be, as much small and imperfectly set fruit drops at the end of this month. Among codlins, Domino is specially good; Warner's King and Grenadier are good, but Lane's Prince Albert, usually producing a full crop, has this year a rather light one. Lady Sudeley promises to be an exceptionally useful dessert kind, planted in the open. Plums on walls have been attacked with green-fly more severely than we have ever seen before, and there was that curling of the leaf which makes it so difficult to destroy the pest while the fruit is tender. We apply insecticides moderately as soon after setting as we think it safe; and when not too cold, water from the hose is, we find, one of the best methods to destroy fly, followed by picking off the worst curled leaves. Vigorous, healthy well-fed trees are likely to outgrow this extraordinary attack, but those who have heavy crops set on badly-attacked trees should thin the fruit severely. We shall be obliged to thin our Victoria plums very much. After many years of varied experience, I am thoroughly convinced that heavy crops should be well thinned, as then the trees do not become exhausted in any one year, and one can obtain a good, useful crop annually. When extraordinary crops are left on, feed the trees as you may, half the crop is scarcely of any use. A moderate crop results in fine fleshy fruits, with a brisk flavour, which are acceptable for dessert in the northern counties. Jefferson is again very fine, but Kirk's Gage is not well cropped.

Some of the apricots have needed much thinning, and for a general crop we find there is nothing so fruitful here as Moor Park. Peaches on open walls have been setting queerly. The fly has been a plague on peaches also, but, after some care and trouble, the trees are growing away clean. Gooseberries are not so heavy a crop as we occasionally have. Whitesmith has a much heavier crop than Whinham's Industry this season. Sulphur Yellow, Glanton Green, and Red Warrington are all fairly good. The gooseberry caterpillar has just made an attack, and we are dusting with hellebore powder, which will be washed off by means of a syringe before the fruit is fit to use, as it is a poison. We dust it through a muslin bag. Of black currants we have certainly one of the finest crops we have ever seen. Hammond's Victoria is a very fine variety. Raspberries promise extra fine crops. Superlative is excellent on canes planted from three to five years ago. The May Duke cherry is fairly good, as usual, but the Morello is lightly cropped.

Alnwick Castle Gardens.

GEORGE HARRIS.

"VIOLETS DIM."

I VENTURE to submit the subject of violas to your readers with trust alone in their sweet associations. Our book lovers I know will love them for the poet's sake, our artists for their pleasing shades and gentle grace, our scientists for the truths they so simply tell, and all I think for their just being violets dim, pansies freaked, thought tokens from childhood onwards.

Shakespeare must have loved the violet. Canon Ellacombe, in his "Plant Lore of Shakespeare," has eighteen references to the flower. The poet notes it as "of virtuous season, forward, not permanent; sweet, not lasting the perfume and suppliance of a minute, no more," in addition to being nodding dim and blue. He makes it an emblem of the untimely death of youth in Pericles and Hamlet; he uses it for the measure of a king in Henry V., where the monarch says of himself "the violet smells to him as it doth to me," but shows its limitations in his sonnets, when he speaks of secrets—

> "These blue veined violets whereon we lean,
> Never can blab, nor know not what we mean."

Milton, telling of the blissful bower in Paradise, writes how the violet with crocus and hyacinth underfoot, "in rich inlay broidered the ground, more coloured than with stone of costliest emblem." Sir W. Scott crowns it as queen of wild flowers, and by all the poets, for beauty or for sweetness, the violet seems to be noticed, as the printer makes Canon Ellacombe say, "with affectation."

It is strange that whether Queen or "lowly down," as some would have it, the violet has no English name. Violet is borrowed from the Greek ion, through the Latin viola. The old vocabularies give the viola translated as Banwyrt, Clœfre, "violé apple leaf," wyolet, vyolytte, violetta, a violet, from the eleventh to the fifteenth century. In the tenth century is the unkindest cut of all, where the herb Viola purpurea is spoken of as useful "for new wounds and eke for old, for hardness of maw." In Charles II. time it was a cure for consumption. Its medicinal uses are still respected, and the chemist finds in it a delicate and useful test. Some violets of the old writers were not violets at all; the early writers on natural history following Pliny called any early flowering plant they fancied a violet; even in 1693 Gilbert writes of "the lesser early bulbous violet a common flower, yet not to be wasted, because when none other appears that does, though in the snow, whence called snowflower or snowdrop," as the only violet. In all Eastern countries it is a favourite flower. The legend goes that Mahomet said "The excellence of the extract of violet, above all other extracts, is as the excellence of me above all the rest of creation! It is cold in summer and hot in winter." The sherbert of the Grand Seigneur is flavoured with its blossoms. In classic times the Athenian crowned with violets was a most honourable distinction; the Romans cultivated it in their gardens; the troubadours received a golden violet as a prize in their floral games. Later in France it became the badge of the Imperial party, and was identified with the Buonopartists during Napoleon's exile at Elba. His farewell promise was to return with the violet. Byron has it—

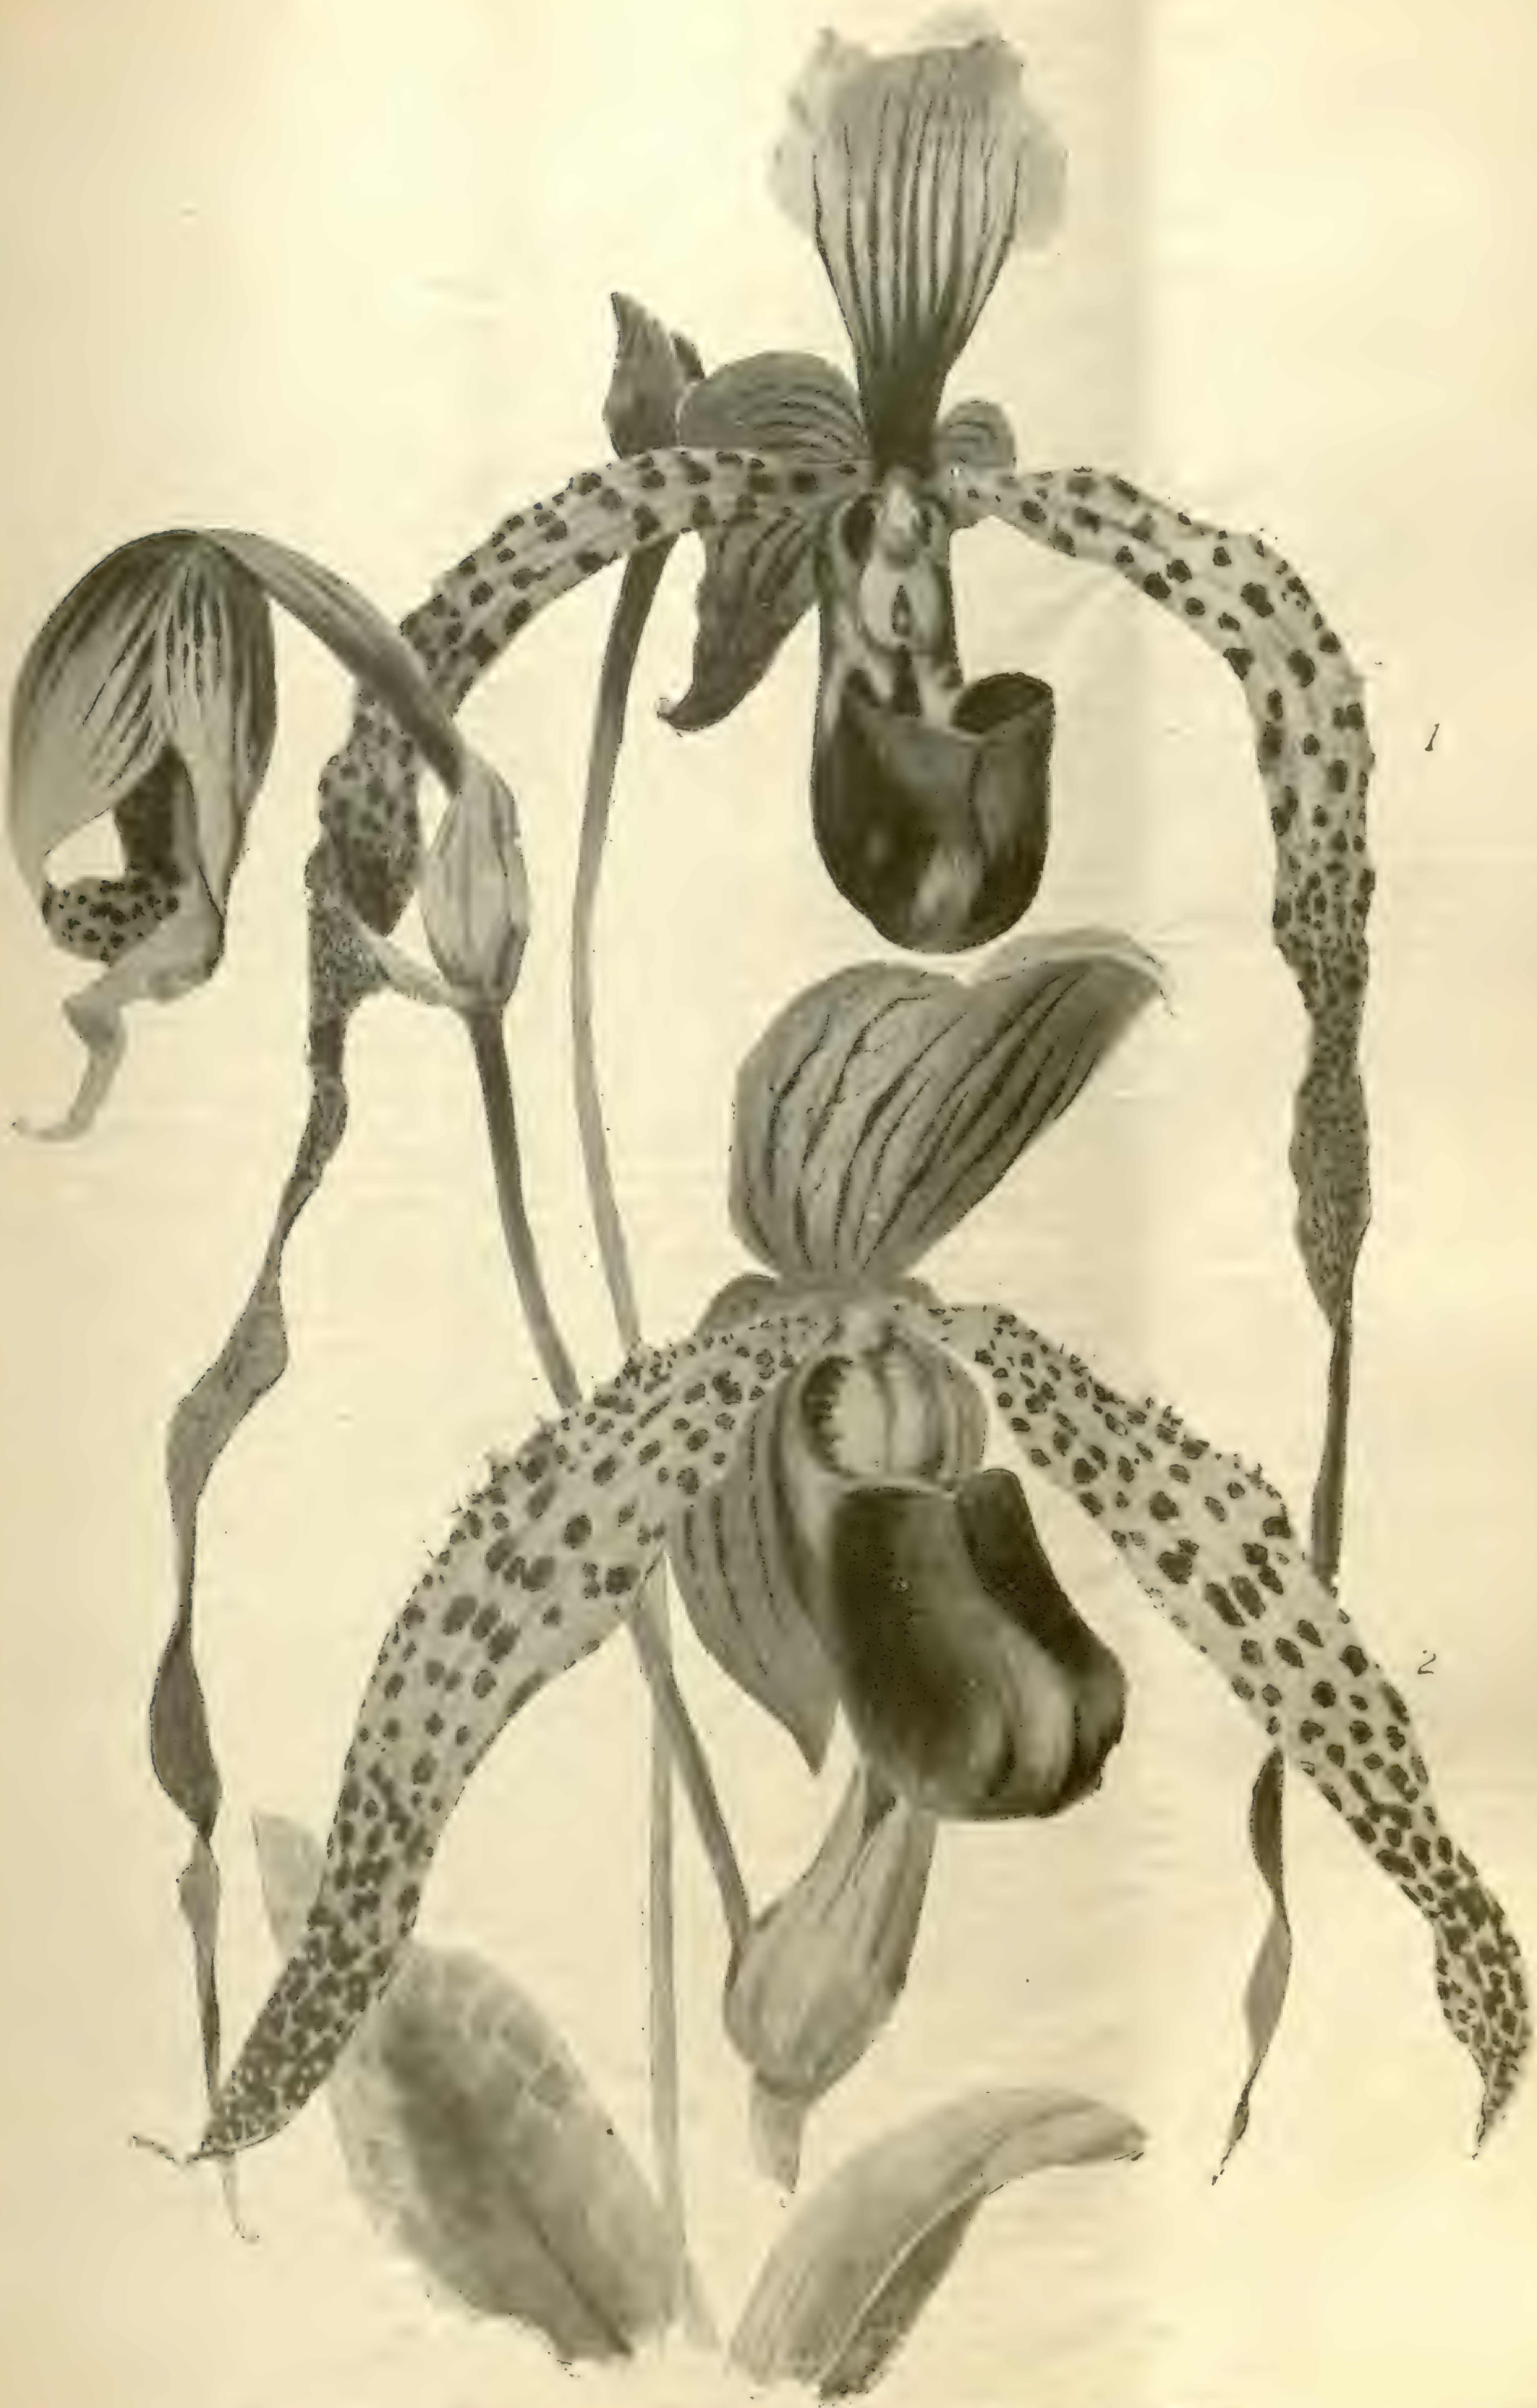
> "Farewell to thee, France, but when Liberty rallies
> Once more in thy regions, remember me then;
> The violet grows in the depths of thy valleys,
> Though withered, thy tears will unfold it again."

His health in exile was toasted as "Caporal Violette, the flower that returns with the spring."

Mdlle. Mars was hissed by the body guard of Louis for wearing violets. The Empress Eugenie silently accepted Napoleon III. by wearing violets in her hair. Afterwards the flowers were the chief tributes on his tomb.

Many other interesting violet associations may be found in Folkard's Plant Lore." Canon Ellacombe, whose "Plant Lore of Shakespeare" I have already quoted, writes further of violets in a letter to myself. "I send you a spray of a pretty little shrub which, unless you are a consummate botanist, you will scarcely recognise as a violet, nor is it exactly a viola; but it belongs to the family of the Violaceæ. It is a New Zealand shrub, quite hardy, and its name is Hymenanthera crassifolia." With this suggestion as to the cosmopolitan character and variety of the order in stem and leaf and fruit, I would bring the subject nearer home. It would be presumption on my part to describe the three hundred species of the Violaceæ, few of which I have been fortunate enough to see but in Britain; instead of fifteen smaller divisions or genera of Violaceæ we have only one, that of viola represented, and in place of the two hundred species contained in it we have but six, on the authority of the "British Flora" of Bentham and Hooker, and of these three are nodding acquaintances with us all. V. odorata, the sweet violet; V. canina, the dog violet; and V. tricolor, the wild pansy or heartsease. So also are the other three, as far as their retiring disposition will permit. I allude to V. palustris, the marsh violet; V. arenaria, the sand violet; and V. hirta, the hairy one. These are all the native species of the genus viola.

Even these I cannot pretend to describe in any detail, but only the two which horticulturally are most interesting. I refer to the sweet violet and the wild pansy. These two are distinct in little matters of form and habit, such as the upper petals of the sweet violet are bent forward to form a hood, while those of the pansy are upright and give the flower a flat, face-like appearance. Again, the stipules, or outgrowths at the base of the leaves are small in the violet and relatively large in the pansy, doing much of the work of leaves, and last, the flowers of the violet in spring, sweet as they are, do not often seed, but leave the work for smaller buds, "cleistogamous flowers," that have their stamens so placed above the ovary that the pollen may send its tubes directly down and fertilise the ovules without any insect aid at all in its deposit. The older botanists were so struck by the discovery that they named one plant "the wonderful violet," to express their admiration for its economy.



NEW HYBRID CYPRIPEDIUMS (No. 1, C. Mrs. Reginald Young; 2, C. I'Ansoni).

Darwin took great pains to investigate these minute flowers. On opening them he found the petals rudimentary or absent, the pollen grains actually growing in the anthers, the pistil small, and the stigma, or pollen deposit point, much reduced. Fertilisation so conducted was a sure and speedy process, and but few pollen grains, only one hundred, were needed to effect it in the flower. As the violet produces seeds chiefly from these self-fertilised flowers, it is somewhat difficult to explain the use of the showy ones. Their persistence can only be accounted for by the use such flowers are in securing an occasional cross by insect visits. The blue colour is said to be specially attractive to bees, as shown by Sir John Lubbock in his book, "British Wild Flowers in Relation to Insects."

This point is disputed by recent papers of Professor Plateau, who, from personal observation, concludes that insects are but little affected by colour; what they seek is pollen or nectar, and to these they are guided with certainty by the sense of smell rather than that of sight. Sir John Lubbock replied to these memoirs at a meeting of the Linnæan Society, refuting the conclusions of Professor Plateau by the record of experiments of his own, and maintaining that the conclusions of Sprengel and Darwin are in no wise weakened by these new observations. To the unconscious selection of insects he still considered we were indebted for the beauty of our gardens and the sweetness of our fields. In the violet, the nodding flower, the dry pollen, the thin, curved style, and the overlapping stamen ends seem all adapted for such a purpose. Such was the opinion of Sprengel after his study of the violets of his day, an opinion which was set aside for seventy years and then brought out again to demonstrate with Darwin "how actual forces were operating before our eyes to modify living forms."

A letter I have received from the curator of the Cambridge Botanic Gardens states the matter well. "The genus viola is one of great botanical interest. It gives us the opportunity of showing that evolution takes place under our very eyes." To return to the question of colour. The blue shade is due to a substance known as anthocyanin. It is remarkable for its constancy in the violet and pansy, none of the cultivated varieties as yet being without a trace in the spur. Anthocyanin appears to be necessary for the protection of plant food substances from the action of light. If a root of violet be placed in water it develops a violet tinge in the light. The reddish-violet tints of sprouting shoots in spring, and the autumn tints of leaves are also caused by the same agent when performing its useful function of protecting certain foods in transit.

With regard to the evolution of colour in violets, Müller states, "that facts go to show they were originally yellow." The smallest and most short spurred is V. biflora. It is visited by flies and short-lipped bees, and its flowers are yellow. The smallest form of V. tricolor has whitish-yellow flowers. Many alpine violas show all stages from yellow to blue, some are yellow throughout; in others the flowers are yellow when open and change gradually to blue as they fade; in others the change is a quicker one. The most highly specialised form is V. calcarata. This is almost always blue, but reverts occasionally to the ancestral yellow. It is fertilised only by lepidoptera; one, a quick worker, has been seen to visit one hundred and ninety-four flowers in six and three-quarter minutes.

The perfume of violets is also found in the wallflower, stock, hesperis, gentian, daphne, and blue water lily. The effect of the colour and odour is seen in the fact that the large, brightly-coloured but scentless pansy is much less visited than the small, blue, sweet-scented violet. V. cornuta is adapted for night fertilisation by moths by its long spur and evening perfume.

Much of the perfume sold as that of the violet, until recently, was obtained from the Florentine iris. The discovery of ionone, the artificial essence of violets, is both a scientific and commercial success. The dispersal of the violet seeds is caused by the action of the capsule after drying. It consists when open of three boat-shaped valves, each containing a double row of seeds. These valves in curling exert such pressure upon the seeds as to shoot them out to a considerable distance.

The cultivation of the violet is a most important business, winter blooming violets being grown in the open, and then lifted for protection in frames by thousands. The use of runners, helping the violet to form new plants at a distance from the parent, but affecting considerably its flowering capacity, is an important detail in this connection. The finest of the sweet violets or violas are mostly of French origin. Princess of Wales is one of the finest of these, having very large blue single flowers, strongly scented, and long, thick stalks. A few American violets, such as California, have been sent out, and are among the newest and finest additions. Easy as it is to find the common violets at this season, the large and beautiful new-fashioned violets which made such a sensation at our autumn show, may fairly now be difficult to obtain. One large firm of growers write from Devon: "Your date, April 6th, is far too late for violet blooms to be characteristic, or fit to be seen." Good advice I received was "keep the violets as cool as possible." I certainly kept them cool, but not collected.

I have to thank Messrs. Barr for beautiful specimens of Princess of Wales and Viola pedata. The others, I was assured by one alpine specialist, could only be obtained by an enthusiast. Viola biflora, V. lutea, V. calcarata, V. striata, V. Munbyana, and V. cornuta, were supplied by Messrs. Backhouse. "Why have I said nothing concerning violets?" asks the Poet Laureate, in "The Garden that I Love," "I have been asked more than once. It was a grave omission, but silence arose not from their scarcity, but from their profusion. They are everywhere, nestling where you will, and everywhere at home. White ones are growing round the very doorstep, and when they have done flowering, their strong green leaves keep the roots of the clambering roses cool all through the heat of summer." Let the poet come from the land where the boys call "Mammole! Mammole!" In the classic streets, he will find no lack of them in the garden that he too loves.

Norwich.

EDWARD PEAKE.

WORK FOR THE WEEK.

WARM ORCHIDS.

CATTLEYA MOSSIÆ will have finished flowering, so the potting must also conclude, and the plants be placed in their growing quarters; a little more shade will be necessary, and a slight watering until active growth takes place, except in cases where plants have been repotted earlier in the season. The root action of imported plants of this cattleya will be fairly brisk by this, so the crocks must be removed, and the plants placed in rough peat and sphagnum. Cattleya [illegible] will have finished its flowering, and young roots will be forming at the base of the bulbous stem; fresh material will be beneficial, and in some cases it may be necessary to shake out the plants, give them new material in pans or baskets; the species thrives well in flat pans suspended from the roof in the cattleya house. C. Schilleriana may be treated exactly in the same manner. C. Eldorado and varieties may also require attention in this direction, and a shady place in the cattlea house is suitable for it at all times. C. Gaskelliana will now be making a nice display in the cattleya houses, filling up a blank between the summer and the autumn and winter flowerings. The flowers are very susceptible to damp, and become spotted unless kept in a dry place. C. superba will now be producing its beautiful flowers; it is, unfortunately, a very difficult subject to manage, flourishing well for a few years only, and then gradually deteriorating as many of the other orchids do. The best place for it is the dendrobium house, placing it in pans or baskets suspended from the roof. Epidendrum bicornutum is another difficult plant to grow successfully, but the present is a good time to rebasket or top-dress it as necessary. Many growers find the dendrobium house a very suitable place for this species while growing; others find the cattleya house suitable, and whichever way is found to be the most successful it should certainly be continued.

The new leaves on Phalænopsis will be growing freely, so it will be well to avoid a stagnant atmosphere; keep the bottom ventilators open at all times, unless cold winds are blowing; pay strict attention to shading. Dendrobium Wardianum and D. crassinode will be now well advanced in growth, so a little stimulant, such as guano, used alternately with liquid cow manure, should be given in a very weak state for a beginning, increasing it gradually as the growths finish. The evergreen dendrobiums will mostly be growing vigorously, so plenty of water will be required, and the syringe must be used pretty freely; fumigating must be done occasionally to keep down red spider or thrips. Selenepediums will require to be carefully watered, and do not allow water to lodge in the axils of the leaves; a slight syringing is, however, necessary at this time of the year. Cypripediums in the warm house will require plenty of water and a good moist atmosphere; fumigation at the present season is most important among this class, for yellow thrips attacks them, and is a great enemy. If it has obtained a footing in any collection, it is a good plan to dust the leaves where attacked with tobacco powder, leaving the same on until the thrips are thoroughly eradicated, after which give them a good sponging with soapy water or fir-tree oil insecticide used a little weaker than the directions given on the bottle.—T. STAFFORD, *Tyntesfield Gardens.*

CONSERVATORY AND GREENHOUSE.

AT last we appear likely to have a continuation of summer weather, and the plantsman's labour will increase, for not only will he have to take care that plants growing in small pots do not suffer for even a short period for the want of water at the roots; but syringing, which perhaps has only been necessary once a day, must be performed twice and copiously. Moreover, there will be many winter-flowering plants, including those used for forcing, such as thorns, roses, lilacs, and many other things which require most generous treatment through the heat of summer, if they are to flower freely during the short dull days of winter, when their blossoms are so valued. It is not uncommon to find these standing about in odd corners, and what watering is afforded is done in a rough way and at long intervals sometimes, causing them to lose their foliage prematurely. It is much better to arrange all such plants in a group, standing the tallest in the centre in such a way that watering is done easily. If the pots can be plunged in a bed of ashes so much the better, or, failing this, a few inches of decayed straw or leaves placed between them will assist to keep the roots cool and active during a period of drought. A free syringing overhead after a hot day will also prove beneficial to these and other plants whose roots are restricted. Those who grow a large collection of chrysanthemums know the extra labour incurred in watering and syringing when the weather remains continuously hot and dry for several weeks, and yet on no account can such important details be put off an hour if the plants are to produce the finest blooms or make perfect specimens. It is often on Sundays that there is a danger of the plants suffering. The plants may be examined in the morning with a view to that watering lasting until the following day, but after midday the soil in many of the pots has become dust dry, the foliage flags, and then a serious check results. Again, potting is often deferred too long, and the roots become so matted together that they do not strike quickly into the new compost when they are potted. It is when plants are allowed to get into this unsatisfactory condition that they cannot stand the force of the sun, and the roots are starved and baked by its power on the sides of the pots where they are chiefly located. I do not recommend plunging the pots up to their rims, but where labour or water is scarce it would be found beneficial and save labour to partially do so in a bed of ashes, or the pots may be shielded from the full force of the sun by standing nine inch boards on edge against them. A cool, moist bed is necessary for all pot plants to stand on during dry weather; but means should be employed to prevent the roots coming through the drainage and becoming established in the ashes beneath, as this may cause the formation of sappy growth, besides which the plants receive a check in the autumn when these outside roots are disturbed and cut off.

Portable frames are most useful to the plant grower, as their position can be altered to suit the seasons and occupants. Some plant houses are too airy during the heat of summer for many things, such as seedling ferns, ferns for cutting, young palms and the like, which delight in a moist shady position. Spare frames may be used with advantage for these, giving them an east or west aspect. If suitable blinds are not available to give the necessary shade, common whitening, mixed with milk, may be used for smearing the glass over. In this way a genial atmosphere may be maintained if the lights are only slightly tilted at the back, and not in such a way as to cause a draught. Provision should be made for sowing herbaceous calceolarias and cyclamens, so as to have good strong plants before autumn. Broad, shallow pans, filled with rich sandy compost, will make suitable seed beds. Sow the seed thinly, cover slightly with fine soil or sand, and place a pane of glass over until germination takes place. Shade and moisture is most important to raise the young plants, and when this is secured we prefer it to raising them in a high temperature, as they come up weakly, and much after care is necessary to properly harden them and produce a sturdy habit.—RICHARD PARKER, *Goodwood Gardens.*

THE FLOWER GARDEN.

THE rearrangement and replanting of daffodil borders should be taken in hand, where this has become necessary through overcrowding, as soon as the leaves have ripened off, which is now generally the case in our borders. For ordinary garden where it is not necessary to lift these bulbs annually, about every three or four years being often enough, unless it is wished to increase the stock of any special variety. In the latter case it is desirable to lift the bulbs and select all those of flowering size for planting by themselves, all the smaller ones to be planted in the reserve garden to grow on into the flowering size. We have already lifted quantities of Sir Watkin, the early N. poeticus ornatus and some others, selecting the largest bulbs, which are used for pots, forcing in boxes, &c., and the smaller ones will be replanted in the reserve quarter to grow on for next year's use. The bulbs, after lifting, should be laid out thinly in a cool shed for cleaning and selection where they may remain a short time, although replanting, where convenient, may be done at once, and in any case the bulbs should be in the ground either during this or early in the coming month. Tulips and other bulbs removed from the flower beds and laid in temporarily until ripened off should be lifted and laid out in a shed to dry, to be afterwards cleaned and stored as soon as opportunity offers, such as a wet day when outside work is necessarily at a standstill.

Although roses are somewhat later than usual in flowering this year, yet by the time this note appears many blooms will have passed, and where propagation of roses from cuttings is desired, the present is the most suitable time for quickly working up a stock of own root roses, as they strike readily now and make plants large enough for planting out in winter or early spring. In many cases it is desirable to shorten the growths of standard and dwarf H.P. roses after the first flowering, thereby inducing the lower buds to break for the second or autumn blooming, and the operation assists in forming a more symmetrical head, especially in the case of standard roses. These shoots being just in the right condition to strike freely may, where own root roses are appreciated, be utilised for cuttings. The readiest method of obtaining a good stock is by the means of a mild hotbed, on which a frame may be placed, surfacing the bed to a depth of three or four inches with cocoa-nut fibre refuse or sawdust, into which the pots may be plunged. The frame should be placed in a north or west aspect, where less shading will be necessary, and in this position the cuttings form roots the more readily. Small 60-sized pots, with a little rough leaf-mould for drainage and filled with sandy loam pressed down firmly, should be prepared for striking the cuttings in. The latter should be made from shoots with two or three buds, the lower leaf being removed entirely, and the wood cut clean through just below a node. One cutting should be inserted in the centre of each pot and a little silver sand allowed to run in around each cutting. Give one good soaking of water, and plunge the pots to the rim in the hotbed, which should be a mild one, and keep them close and shaded from bright sunshine. In this medium they form roots in about a fortnight, when air may be admitted gradually, and in a few weeks they will have filled the pots with roots. They should then be potted on into large 60's or 45-sized pots, and by this time they may be placed in a cold frame stood on a hard ash floor. All sections of roses, including teas, climbers, &c., may be propagated in the same way. Where briar stocks have made sufficient young growth, budding may be carried on from this time, the showery weather having promoted a free growth, and rendering the lifting of the rind comparatively easy and safe. Soft cotton as sold for this purpose forms the best binding material, and the buds should be inserted as close to the base of the shoot as possible.

In the pleasure ground seed pods should be removed from choice hybrid rhododendrons, especially from small plants and those recently planted; the latter should also be supplied with water when necessary to encourage a free growth in the plants, without which little flower may be expected the next season.—C. HERRIN, *Dropmore Gardens*.

HARDY FRUITS.

THE strawberry crop this year has been later than usual, and those who rely upon runners from plants that have borne fruit will be late, but of course, with attention to details, the plants will soon be ready for their permanent quarters if the parents are healthy and not crowded. In previous numbers of the GARDENERS' MAGAZINE I have dwelt upon the importance of young plants for the production of early fruits, and this year have I found them more valuable than ever, as the fruits do not decay so quickly as on plants with a large amount of leafage. As the results are so satisfactory, it may not be out of place to give brief cultural details as to this method, especially as now is the season for the work. By growing plants purely for runner production, much earlier runners will be secured than from fruiting plants. The flowers are picked out of these, and the runners layered into small pots as early as possible. The cultivator can layer his runners in the way he likes best, but there should be no delay in planting out as soon as these are rooted. This is a great point in the production of early fruits, and we go farther, only taking a single crop of fruits, as by doing so, we get much finer fruits, earlier, and at no great cost. I must admit the land needs more cultivation than usual, but it is not lost labour. After the strawberry crop the plot is in capital condition for green crops, such as broccoli, borecoles, and others; it is useless to take half measures. The most important work in connection with strawberry culture, no matter what system is followed, is thorough cultivation of the soil previous to planting, and now is a good time to prepare land for new plantations. In light soils strawberries have much to contend with, and it is advisable to add heavy materials such as clay or marl, for this, incorporated with the surface soil, will be of great assistance; on the other hand, if the plants are not left longer than for one crop it is not necessary to make the soil so suitable, for they have ample food for the one year, and this is one reason why I advocate the culture of the strawberry for a much shorter period than is usually the case. All varieties, however, are not alike suitable for this annual culture; thus the Pine section and British Queen are better the second year than the first, as is also that excellent variety, Laxton's Latest of All. Royal Sovereign is a splendid variety to grow as advised, and it bears so freely from one season's growth that it is our most profitable variety. In most gardens a long strawberry season is valued. For our early supplies Laxton's Earliest of All is first to mature, but I am not so fond of it as others, for it lacks size, and is only a little in advance of the excellent Royal Sovereign. For preserving, it is difficult to beat Vicomtesse H. de Thury; its fruit is not large, but especially good when preserved. La Grosse Sueree is still a favourite with us, but our best mid-season strawberry this year is Laxton's Leader, a very fine variety which will doubtless become a standard kind; it does grandly in light soil, is a closer grower than Royal Sovereign, and of first-rate flavour. I do not intend to dwell upon varieties, as in different soils and localities results differ, so that it is well to give any variety a good trial before planting it largely.—G. WYTHES, *Syon House Gardens*.

THE BEST GUIDE to the garden for the whole year is the "Gardening Year Book, containing practical articles on the cultivation of Flowers, Fruit, Vegetables, &c. Price 1s. 'Gardeners' Magazine" Office, 4, Ave Maria Lane, London.—[ADVT.]

EXHIBITIONS AND MEETINGS.

NATIONAL VIOLA SOCIETY, July 2.

THIS society held its annual display at the Crystal Palace on the above date, and were wise in fixing the exhibition on the same day as the great rose show under the same roof. The numerous visitors to the display of the "national" flower, therefore, had the additional attraction provided by the interesting, if less pretentious, display of the viola and pansy, and that advantage was taken of this there was ample proof by the visitors carefully scrutinising the exhibits staged in competition from the time the exhibition was opened until its close. There was evidence of weakness here and there in the different classes, showing that the enthusiastic admirers of the flower had been passing through an exceptionally trying season, and it is, therefore, all the more pleasing to record that there was not wanting illustrations of cultural skill from the gardens of growers in the North, as well as the South. This was quite as much noticeable in the exhibits of amateurs as in those of the trade exhibits, and proves conclusively how keen is the interest now taken in these flowers.

Violas, as usual, predominated, and in the arrangement of them a new departure was taken. Several classes in which they were arranged in sprays were, as usual, provided; but to some, who tired of this manner of exhibiting them, provision was made to display the flowers and foliage in saucers and specimen glasses. This appeared to be a simpler method of arrangement, and was fully appreciated by the competitors. It must be acknowledged that the effect by the new method of staging was not so striking, yet it showed the practical value of the flower for decorative uses.

Fancy pansies came from Scotland and Bristol, and each made a brave show; and much was to be gained by listening to the varied comments of the visitors upon the rival claims of the pansy and the viola.

OPEN DIVISION FOR VIOLAS.

The leading class for violas was for forty-eight sprays distinct, each spray to contain nine blooms, and arranged with viola foliage. There were two competitors in this class, premier honours resting with the fine exhibit of Mr. William Sydenham, Tamworth, who had a grand exhibit of large, fresh, and well-coloured flowers, neatly set up, and each carefully named. Of the older varieties in commerce and in good form were Lemon Queen, Countess of Kintore, Accushla, Kitty Hay, Acme (very bright), Councillor W. Walter, Sylvia, Duchess of Fife, Mary Scott (exceptionally fine), and Formidable; and of the newer introductions we noticed William Tell (creamy white), Althea (a pretty blue-edged variety), Masterpiece (very white), J. Quarton (mauve blue), Queenie (blue-edged and shaded), Cottage Maid (violet, blue, and lavender), Ophelia (heliotrope-blue), Florizel (blush lilac), Magnificent (good blue), Pembroke (rayless yellow), Devonshire Cream (cream), and Blanche (grand pure white). This exhibit secured the gold medal. Second prize was awarded to Messrs. Isaac House and Son, Bristol, who also had a grand lot of flowers, which kept wonderfully fresh throughout the day. Specially good were their sprays of Duchess of Albany, Craigie, Sheelah, Countess of Hopetoun, Princess Ida, and Stobhill Gem. The class for twenty-four sprays distinct, secured a good entry, first prize being awarded to Mr. M. Campbell, High Blantyre, near Glasgow, with a good exhibit, though containing too many of the older and coarser kind of blooms. His best sprays were Butterfly, Dr. Stokes (a striped variety), Liz Barron, Magic, Florizel, Dorothy, Princess Ida, Kitty Bell, Border Witch, Nellie (a good white rayless flower), Ulidid, Duchess of York (a rayed white self), A. J. Rowberry (a rich yellow rayless self), Lord Salisbury (a coarse-rayed primrose), and Lizzie Paul. Second prize fell to the lot of Messrs. J. Cheal and Son, with smaller, but an even lot of flowers. Norah May, William Niel, Florizel, Sweet Lavender were the best in this stand. Mr. W. Baxter, Woking Village, Surrey, was a close third, Endymion (a new pale yellow), Stobhill Gem, and Duchess of Fife being his best sprays. For twelve sprays rayless varieties, distinct, six blooms in each spray, Mr. D. B. Crane, 4, Woodview Terrace, Archway Road, Highgate, N., was an easy first, staging a beautifully even and fresh lot of flowers. His varieties were Florizel, Britannia (a splendid deep blue), a clear, rich yellow seedling variety Nellie, White Empress (large pure white), Rosen Pallida (blush-rose), Pembroke, Mary Scott, Sir Robert Peel (a good lemon-yellow), Devonshire Cream (a splendid cream), Christiana, and a deep rich yellow seedling from A. J. Rowberry. Second prize was won by Messrs. Isaac House and Son, with smaller but pretty neat flowers. Princess Louise, Cooper O'Fogo (blue), Blush Queen, White Empress, and A. J. Rowberry were good in this stand. A stand of large flowers by Mr. M. Campbell was disqualified, as it contained several rayed flowers. For twelve saucers of distinct varieties, arranged in moss and not wired, brought out two nice lots. First prize was secured by Mr. M. Campbell, who arranged his saucers very prettily; Cissy Mellows, Lavender King, Lez Barron, Lord Salisbury, Stobhill Gem, Butterfly, Iona, A. J. Rowberry were the best. Messrs. I. House and Son were second with flowers of a much smaller size, and evenly arranged. For the twenty-four varieties, arranged in specimen glasses, each glass to contain nine blooms, there were two excellent exhibits. Messrs. I. House and Son were placed first with a pleasing assortment of colours and in good form. Mrs. C. Lowe, Ryhall, Stamford, was a good second, her exhibit being rather overdone with foliage. Her flowers, however, are pleasingly disposed. A special prize offered by Mr. B. G. Sinclair for six vases of violas distinct, arranged with any foliage, brought out a spirited competition. Mr. D. B. Crane was a good first, using pretty light green and bronze-tinted fronds of adiatum in conjunction with some pleasing shades of colour in his flowers. This system of showing is worthy of encouragement. Messrs. I. House and Son were second with prettily-arranged vases, and Mrs. C. Lowe was a good third, each showing prettily-arranged exhibits.

AMATEURS' DIVISION FOR VIOLAS.

In this section the competition was not so good as usual, the competition in some classes being represented by individual exhibits. The principal class was one for twelve spray violas distinct, six blooms in each spray. In this class the only exhibitor was Mr. D. B. Crane, who showed some handsome sprays of these flowers, which would have stood him in good stead in keen competition. His flowers were large, of good colour, beautifully fresh, and neatly arranged. His varieties were: White Empress, Mrs. C. F. Gordon (very fine), Florizel (grand colour), Magic Duchess of Teck (the latest sport from the Duchess of Fife family), Mrs. Scott, Stobhill Gem (a grand flower), Pembroke, Endymion, Duchess of Fife, Iva Fergusson (one of the darkest flowers), and a pretty yellow seedling. First prize was awarded this exhibit. For six sprays distinct, Mr. Leonard Brown, The Cottage, Seven Arches, Brentwood, showed well, first prize being awarded for a neat stand of blooms, Goldfinch, Mrs. C. F. Gordon, Magnificent (a good blue), Stephen, Mrs. William Greenwood, and Duchess of Teck being the varieties submitted. Mr. Brown was also first for six sprays rayless varieties distinct, A. J. Rowberry, William Tell, Florizel, Blanche, Lucy Franklin, and

Pembroke being seen to advantage. Mr. D. B. Crane closely followed for second prize place, his White Empress, Mary Scott, and a yellow seedling being in fine form. Mr. Brown was the only competitor for six sprays miniature varieties, and secured premier honours with pretty little flowers of Violetta, Blue Bell, Canary Bird, Old Gold, Mabel, and Bessie, each quite representative of the type. A novices' class for six sprays, each to contain three blooms, brought an exhibit from Major-General Gillespie, who staged a meritorious lot of blooms for a beginner, and secured first prize. Violas arranged in saucers were staged by Mr. B. G. Sinclair, Highgate Road, N.W., who arranged his blooms, which were fresh and clean, in a pleasing way. Mrs. C. F. Gordon, Lady Isabel, and Norah May were his best flowers. Dr. Shackleton, West Hill, Sydenham, staged nine varieties in vases, and set them up in nice artistic manner. New Duchess, Border Witch, Mary Scott, Duchess of Fife, White Duchess, and Christiana were his best, and secured first prize. Mr. B. G. Sinclair followed with smaller but neatly arranged specimens.

FANCY PANSIES.

The open class for forty-eight sprays, pansies, distinct, brought a good exhibit which secured the gold medal for Messrs. Isaac House and Son, Bristol. The blooms were large, fresh, and of good colour, and embraced both new and old standard varieties. Conspicuous among them were Colonel M. R. Buchanan, The Baron, W. H. Clark (splendid flowers), James J. Irvine, Beauty (grand), B. Doulton, Annie Ross, James Stewart, Mrs. W. Steele, Betsy Kelly, John Jackson, D. G. McKay, and D. Russell. In the class for twenty-four fancy pansies, distinct, Mr. M. Campbell was a good first with a splendid stand of blooms, and in the pink of condition. The best varieties were W. H. Clark, Annie Ross, J. Menzies, Sir J. Watson, Mrs. R. Stewart, Marmion, Mrs. Niel McKay, and D. G. McKay. The class for twelve fancy pansies, distinct, again found Mr. Campbell in the foremost position with a capital stand of blooms. Colonel M. R. Buchanan, Bernard Doulton, Mrs. A. Steele, and Mrs. R. Stewart being staged in excellent condition. Messrs. I. House and Son were placed second with neat specimens.

WIMBLEDON, July 6.

A very pretty exhibition of fruits, flowers, and vegetables was held on the above date in the spacious grounds of Canizaro House, lent for the purposes of the show by Colonel Mitchell, V.D. The groups and the fireplace decorations formed an attractive feature, while the cottagers' exhibits were most interesting and good.

Mr. A. Mewell, gardener to Sir E. Saunders, Fairlawn, Wimbledon, took first prize (special class) for a group of miscellaneous plants, arranging bright crotons, pandanus, gloxinias, begonias, &c., over a groundwork of the popular gypsophilla; Mr. W. Thornton, gardener to W. J. Crocker, Esq., Draxmont, Wimbledon Hill, second. In the class for single-handed gardeners, the best group arranged on a space of fifty square feet came from Mr. F. Kleigl, gardener to R. T. Buyne, Esq., Glenmara, Wimbledon Park; Lilium speciosum, Canterbury bells, begonias, and petunias were used most tastefully and effectively; Mr. F. Chandler, gardener to Canon Haygarth, The Vicarage, was placed second; Francoa ramosa, cannas, and semperflorens begonias were used here to advantage. In the special class for a drawing-room fireplace and mantel decorated with plants, Mr. J. Hutton was awarded first place for a nice exhibit consisting of caladiums, crotons, ferns, and liliums; Mr. Newell was placed second, but, owing to its lightness, caused by the use of gladiolus The Bride and gypsophilla, we liked his exhibit the best of the two.

For exotic ferns, Mr. J. Hutton, gardener to G. E. Frere, Esq., The Camels, Wimbledon Park, was the leading exhibitor. Mr. Hutton also scored for four stove and greenhouse plants, his set containing a finely-flowered ixora. Mr. G. Hutton led the way for six stove and greenhouse plants, his Gloriosa superba and Cattleya Mossiæ being good; Mr. Methven, gardener to D. W. Keiller, Esq., Fernwood, Wimbledon Park, second. The best fuchsias, tall, well-flowered examples, came from Mr. Thornton. Mr. Chandler, the vicar's gardener, scored for six distinct zonal pelargoniums with neat specimens. Mr. A. Skeggs, gardener to Mrs. Dann, Copse Hill, Wimbledon, had much the best set begonias, his double forms being very well managed. Mr. Kleigl had the best coleuses, a fair set. Mr. Mills, gardener to G. D. Carver, Esq., Edge Hill, showed the finest gloxinias. A pretty set of table plants enabled Mr. McGregor to take first place in a close competition; Mr. T. H. Bolton, gardener to Lord Tankerville, Kingston Hill, second.

The stand of roses put up by Mr. W. Taylor, Hampton, Middlesex, gained first prize, and contained a fresh set of blooms, the varieties being Heinrich Schultheis, Margaret Dickson, Ulrich Brunner, La France, Suzanne Marie Rodoconachi, Lady Mary Fitzwilliam, Gustave Piganeau, and Pride of Waltham; second row—Caroline Testout, Duke of Fife, Mrs. J. Laing, Xavier Oliba, Mrs. S. Crawford, Mrs. G. Dickson, Viscomtess Folkestone, and Captain Hayward; front row—Louis Van Houtte, Madame G. Luizet, Maurice Bernardin, Innocente Pirola, A. K. Williams, Kaiserin Augusta Victoria, Abel Carriere, and Jeannie Dickson; Mrs. J. Laing in this set was a very good flower; Mr. C. Gibson, gardener to J. Wormald, Esq., Morden Park, Morden, second. Mr. Gibson led the way for twelve roses; Mr. McGregor, second. In another class for twelve roses, Mr. F. Staples, gardener to W. B. Faulkner, Esq., Fairholme, Worple Road, was first; and Mr. C. Pullen, gardener to P. B. Fowes, Esq., Raynes Park, second. Mr. Chandler and Mr. J. Wright were also winners of prizes for roses.

Mr. Newell, Fairlawn Gardens, showed the best collection of hardy herbaceous perennials, three sprays of each, eighteen distinct sorts; Mr. J. P. McGregor, gardener to the Dowager Lady Hay, North House, Putney, was second. For twelve bunches of hardy flowers, Mr. Newell was again first, but seems to have strained the schedule arrangements severely, for he used asparagus, berberis, and other foliage to show off the flowers of sweet sultan, pinks, and carnations. Mr. Newell had the best three button hole boquets and three ladies' sprays, using carnations, buff rose buds, and tuberoses most effectively. Mr. Newell also had the best epergne, using W. A. Richardson roses with gypsophilla and asparagus.

Mr. C. Gibson, Morden Park Gardens, secured first prize for three bunches of black grapes; Mr. J. Hutton second; both showing well-coloured Black Hamburgh. The best three bunches of white grapes came from Mr. Gibson, and were remarkable for the size and colour of their berries; Mr. Methven second, with Foster's Seedling; and Mr. J. Hutton third. For peaches, Mr. D. Gibson, gardener to J. B. Johnstone, Esq., Coombe Cottage, showed the best peaches, Barrington being the variety. Mr. Newell had the finest melon—Countess. Strawberries were good, though not plentiful, Mr. Hutton leading for one dish with the ever popular Royal Sovereign.

In the society's class for half-a-dozen sorts of vegetables, Mr. Kleigl was first, his tomatos and peas being excellent; Mr. T. Chandler second. Mr. Kleigl was also first in another class for six distinct kinds of vegetables, Mr. Chandler scored for cucumbers. In the Sutton class for a collection of vegetables, Mr. D. Gibson took chief honours with Magnum Bonum cauliflower, Giant Rocca onion, Supreme potato, Eclipse tomato, Early Snowball turnip, and Duke of Albany pea; Mr. Laker, gardener to Mrs. Wingfield, Belvedere House, second. In the class provided by Messrs. D. S. Thomson and Sons, Wimbledon, Mr. D. Gibson was again first, his cucumbers, peas, tomatos, and cauliflowers being very handsome; Mr. J. French, gardener to Mrs. Barclay, Ambleside, Wimbledon Park, second; and Mr. H. Mills, gardener to E. D. Carver, Esq., [illegible] Edge Hill, third.

Messrs. D. S. Thomson and Sons, Wimbledon, put a large non-competitive display, the Acer negundo variegata, gladiolus The Bride, dendrobiums, gloxinias, hydrangeas, gloxinias, odontoglots, &c., being effectively staged. This firm also arranged a capital show of bouquets, notably harps and other floral designs, all made up in a most skilful and artistic manner. Mr. Will Tayler, Hampton, made a charming display with cut specimen roses and fine bunches of popular garden roses.

ISLE OF WIGHT ROSE SOCIETY.

The Isle of Wight Rose Society held its annual exhibition of roses in the picturesque grounds of Carisbrooke Castle on Coronation Day. The day was beautifully fine, and the attendance, through exertions of the hon. secretaries, Rev. G. E. Jeans and Mr. E. V. Matthews, was very good. During the past six years the above society has been most fortunate in having their exhibitions in grounds renowned for beauty and picturesque surroundings and extensive landscape views, which undoubtedly have greatly assisted to ensure its success.

The principal prize-winners on the above occasion were, in the open classes, Mr. B. R. Cant and Messrs. F. Cant and Co. Mr. B. R. Cant secured the silver medal for the best rose of any sort in the show with Mrs. John Laing. In the Isle of Wight classes Miss Croft-Murray secured, for twenty-four distinct roses, the Isle of Wight silver challenge cup. Major O. Moulton-Barrett secured the Queen's gold medal for twelve distinct roses, and Miss Murray the silver gilt medal for twelve distinct teas. In the divisional classes Mr. J. O. Brook was first for eighteen distinct roses, and Mr. G. Williams, second, whilst for four distinct, three trusses each, Miss Murray was first, and Mr. J. O. Brook second. In the class open to growers of less than three hundred plants Miss Carter was first for twelve distinct roses, and also for three distinct, three trusses of each. Among growers of less than one hundred and fifty plants the Rev. R. L. Morris was first for twelve roses, any number of varieties; Lady Gordon, second; and Lady Daly, third. For six distinct Rev. C. W. Heald was first; Lady Daly, second; and Lady Gordon, third.

The silver medal for the best rose of any sort shown from the island was won by Miss Croft-Murray. For twenty-four roses of any kind and any number of varieties, open to the island, Miss Croft-Murray was first, and Mr. J O. Brook second In the competition among ladies residing in the island, Mrs. Lee-White secured premier award for table decoration, roses of any sort to form the principal feature. Miss Bull was first for an epergne or basket of roses with any foliage, and also for a vase or bowl of roses. Among Isle of Wight gardeners only Mr. N. G. Jolliffe was first for twelve roses, any number of varieties; Mr. J. Athill, second; and Mr. H. Wavell, third. The cottagers' prizes were secured by Mr. G. Leek, sen.

ISLE OF WIGHT HORTICULTURAL IMPROVEMENT ASSOCIATION.

On Thursday, June 30, the members of the Isle of Wight Horticultural Improvement Association, accompanied by the chairman, Dr. Groves, paid a visit to the nurseries of Messrs. Sutton and Sons, Reading. On their arrival they were met by Mr. M. H. Sutton, Mr. L. Sutton, and Mr. H. Sutton, who most courteously received them and conducted them through the offices, seed rooms, and store rooms of this far-famed house. The management of every department is unique. The foreign department was an eye-opener to many of the members who for the first time visited a trade growers' establishment. After lunch, which was presided over by Mr. L. Sutton, the party visited the trial grounds, spending much time amongst the various crops, under the guidance of Mr. H. Sutton. During the luncheon Mr. Sutton, sen., came into the Abbey Hall to welcome the party and was hailed with rounds of applause.

The greenhouses were next visited and the gorgeous display of begonias and gloxinas is indescribable; the colours and forms of the most highly developed types far exceeding anything found in illustrations. The calceolarias which had done duty at Manchester and other shows were of high cultural merit, though the flowers were practically over, yet one could see what they had been. The curious flowers of Clianthus Dampieri were inquisitively examined. After visiting the Abbey Ruins and Forbury Gardens, tea was enjoyed in the Abbey Hall.

Before departing for the Garden Isle a unanimous vote of thanks was accorded Messrs. Sutton and Sons for their kind hospitality and for affording the members of the Isle of Wight Horticuitural Improvement Association the privilege of inspecting their establishment. It was a most enjoyable outing, and a red letter day in the history of the assocation.

THE monthly meeting of the Isle of Wight Horticultural Improvement Association was held at Sandown on Saturday last. Mr. T. Gibbs, C.C., was unanimously voted to the chair in the absence of Dr. Groves, chairman of the association. Mr. J. H. Perkin obtained from the following exhibitors a miscellaneous collection of exhibits which were thrown open for inspection to the public free of charge during the afternoon. Mr. A. Plumbley, Aspenleigh, Sandown, staged a collection of penstemons, stocks, foxgloves, and Canterbury bells; Mr. J. Nicholas, Kintore, Sandown, staged a stand of roses and a stand of [illegible] dahlias; Mr. W. Downer, Shanklin, staged a dish of Polgate tomatos; Mr. W. Gibson, Sandown, staged a basket of Comet tomatos; Mr. A. Cole, of [illegible]lands, Sandown, arranged a miscellaneous group of foliage and flowering plants; and Mr. J. H. Perkin, Loo Altos, Sandown, contributed a group of stove [illegible] and flowering plants and a stand of roses. Messrs. Perkin and Cole each received a certificate for their excellent groups which were effectively arranged.

In the evening Mr. W. C. Moseley, of Banchurch, read an excellent paper on "Meteorology in relation to Gardening," which contained many useful hints on the management, uses, and structure of thermometers, barometers, rain gauges, and sunshine recorders. A hearty vote of thanks was accorded the lecturer and exhibitors on the motion of the secretary (Mr. S. Heaton) and seconded by the Rev. F. A. Bamford. Several new members were elected at the close of the meeting.

ROYAL HORTICULTURAL SOCIETY, July 12.

ONCE again we have to record a first-rate fortnightly exhibition at the Drill Hall, Westminster, coupled this time with an excellent rose show, so that visitors who paid for admission had good value for money. Fruit was well shown; sweet peas and other hardy flowers were grand; orchids were good, though not so [illegible] as usual.

FLORAL COMMITTEE.

Mr. C. Smith, gardener to Martin R. Smith, Esq., Hayes, Kent, put up a superb group of Malmaison carnations, the varieties, Mrs. Martin Smith, Calypso, King Oscar, and Mrs. Trelawney being especially good, the former making up the bulk of a very handsome group, that did great credit to Mr. Blick. Messrs. J. Carter and Co., High Holborn, had a pretty exhibit of delphiniums, showing grand spikes of blue varieties in many pleasing shades; the bowls of sweet peas with the flowers set in moss, and accompanied with Asparagus plumosus, made a very pleasing feature of an extensive display. Sweet peas were shown by Messrs. H. Cannell and Sons, Swanley, the firm making a good groundwork of bracken to set off the blooms to advantage. All the sorts were well grown, but Countess of Shrewsbury, Blanche Burpee, Primrose, Prince Edward of York, Ovid, Duke of York, Mars, and Lonely were those we most admired in a fine set. Bronze [illegible] and other good pansies were shown by Mr. Eckford. The ever-popular sweet peas were also shown by Mr. F. G. Foster, Brockhampton Nurseries, Havant, who had a beautiful lot of flowers, but in not a few cases put too many in a bunch; Stella Morse (yellowish), Earliest of All, Mars, Black Knight, Cardinal, Oriental, and Celestial were attractive sorts well staged.

Mr. Whillans, gardener to the Duke of Marlborough, sent several fine carnations, Oxford Yeoman being a fine crimson scarlet. Messrs. Koster and Co., Boskoop, Holland, sent a fine specimen of Abies pungens glauca pendula, a beautiful plant. Messrs. W. Paul and Son, Waltham Cross, Herts., showed a splendid lot of roses, all varieties raised by the firm; Exquisite (H.T.), Wordsworth (H.T. and China), Waltham Standard (H.P.), and Milton, a lovely rosy crimson H.P., were especially good; Tennyson is also a lovely creamy-white H.T. Mr. N. N. Sherwood, Dunedin, Streatham Hill, showed an interesting set of varieties of the Cupid sweet pea; these made good pot plants. Mr. J. Douglas was to the front with carnations, putting up a large number of new seedlings. Mr. H. B. May, Edmonton, showed a most interesting group of aspleniums, [illegible] not less than sixty-five species and varieties, these including A. flabellifolium, A. præmorsum, A. Nidus-Avis, A. caudatum, the bold A. marginatum, A. divaricatum, and A. fragrans; Mr. May also showed finely cultivated specimens of Golden Fleece abutilon, and Swainsonia galegifolia. Mr. Simpson, gardener to W. Marshall, Esq., Auchinraith, Bexley, showed a handsome plant of Polystichum angulare × P. aculeatum. Mr. Baines, gardener to Sir Trevor Lawrence, Bart., Dorking, showed a splendidly-flowered plant of the deep blue Exacum macranthum. Besides their new roses already referred to, Messrs. W. Paul and Son put up a fine display of cut blooms and standard and bush plants in pots, all grandly flowered; foremost varieties were Waltham Standard, White Lady, Ella Gordon, Empress Alexandria of Russia, Enchantress, and Madame Charles. A first-rate display of ferns was made by Messrs. J. Hill and Son, Edmonton.

Mr. T. Young, gardener to Daniel Cooper, Esq., Warren Tower, Newmarket, showed Malmaison carnations in fine condition, the flowers being large and the plants clean and healthy. From Messrs. R. Wallace and Co., Colchester, came an interesting display of liliums, calochorti, and iris. Lilium pardalinum californicum, L. Browni, L. speciosum album, and L. Parryi were fine, as also was the lovely Hemerocallis aurantiaca major. Garden roses were beautifully shown by Mr. J. Pitt, gardener to F. W. Campion, Esq., Colley Manor, Reigate; the roses were lovely and the bunches large, though too closely packed in some instances. L'Ideal, W. A. Richardson, Crimson Rambler, Longworth Rambler, and Macrantha were especially noteworthy. A grand exhibit of garden roses was also contributed by Mr. C. Turner, Royal Nurseries, Slough, who had big bunches of Crimson Rambler, Fimbriata, Blanche Moreau, Alister Stella Gray, Olga de Wurtemburg, and The Pet, besides several new seedlings. Messrs. Paul and Son, Cheshunt, staged garden roses in light bunches, besides Japanese iris, Orchis foliosa, Spiræa palmata, and S. aruncus; Madame Pierre Cochet, Narcissus, A. S. [illegible], Gustave Regis, Royal Scarlet, Madame Pernet Ducher, and Madame [illegible] Guinoisseau were among the best of the roses.

Mr. Baskett, gardener to Lord Penzance, Eashing Park, Godalming, showed [illegible] boxes of garden roses all obtained by hybridising; they were a fragrant lot of [illegible], especially the newer sweet briar hybrids. Mr. H. Eckford, Wem, Salop, put up a grand exhibit of sweet peas staged in tall glass vases; this was a most attractive exhibit and contained several new varieties in addition to all the leading [illegible] productions; Lady Skelmersdale, Mrs. Dugdale, deep rose; Fascination, [illegible]; Othello, deepest crimson; and Sadie Burpee, creamy white, were especially fine new forms that are likely to well sustain Mr. Eckford's reputation. Messrs. Barr and Sons, Covent Garden, put a pretty exhibit of Iris Kæmpferi in a variety of colours; all grand flowers and mostly named. The lovely golden Eremurus Bungei was also well shown by the Messrs. Barr.

Messrs. J. Veitch and Sons were again the only competitors for the Sherwood Cup, and they staged a pleasing exhibit of annuals and biennials in great variety, [illegible] demonstrating the utility of such flowers for garden and home decoration.

ORCHID COMMITTEE.

A good display came before this committee. Mr. W. H. White, grower to Sir Trevor Lawrence, Bart., Dorking, showed Vanda Miss Joaquim, carrying a [illegible] spike of fourteen flowers and buds, and Oncidium albo-verrucosum, a [illegible] yellow oncid. Mr. W. H. Young, grower to Sir F. Wigan, Bart., East [illegible], sent a grand flower of Cattleya gigas, which lacked the usual "eye." Messrs. [illegible] Low and Co., Bush Hill Park, Enfield, exhibited a fine form of Cypripedium [illegible] and some charming forms of Cattleya Gaskelliana alba, Bulbophyllum Lobbi, &c. Mr. Bristow, gardener to J. W. Temple, Esq., Leyswood, Groombridge, put up a grand group of Cattleya gigas, the numerous, well-grown, [illegible] large specimens representing handsome varieties, highly cultivated. Mr. J. [illegible], gardener to H. Hicks, Esq., Branwoods, Great Baddow, Chelmsford, [illegible] a magnificent specimen of Dedrobium Dearei, carrying eleven spikes of [illegible] flowers, and others to follow. A cultural commendation and silver [illegible] medal were awarded. Mr. Ballantine, gardener to Baron Schroder, The [illegible], sent a curious form of Odontoglossum crispum.

FRUIT COMMITTEE.

Messrs. J. Veitch and Sons, Chelsea, showed a grand lot of fruit, chiefly [illegible] and cherries; the cherries in pots, quite dwarf trees, laden with [illegible], were great attractions; the sprays of Black Hawk were specially good. [illegible] the picked cherries Governor Wood, Guigue d'Annonay, Elton, Black [illegible], Cleveland Bigarreau, Frogmore Early Bigarreau, and Bigarreau de [illegible] were the finest, and had all been grown in the open on pyramid trees. [illegible] the strawberries we made special note of Sensation, The Countess, Lord [illegible], Gunton Park, Waterloo, British Queen, Leader, Cardinal, Elton Pine, Royal Sovereign, and the new Veitch's Prolific, a fine variety obtained by crossing British Queen with Empress of India.

Mr. O. Thomas, gardener to Her Majesty the Queen, Windsor, staged a grand lot of fruit, putting up thirty dishes of strawberries which included splendid dishes of Sensation, Bicton Pine, James Veitch, Waterloo, Leader, A. Barron, The Countess, and Aronatic; Gross Mignonne, Walburton Admirable, Violette Hâtive peaches were good, so also were the several nectarines and melons, while the cherries should have been seen to be fully appreciated; their size, quality, and colour being first-rate. Several new melons were staged, but none gained awards. Messrs. Laxton Brothers showed baskets of their grand strawberries Leader, the new Mentmore and a cross between Royal Sovereign and Commander. Royal Charlotte peaches were shown by Mr. Bain, gardener to Sir Trevor Lawrence, Bart., Dorking.

Mr. H. Eckford, Wem, Salop, showed some splendid culinary peas, Ideal, Precocity, The Prior, and Wem Giant being the best. Messrs. H. Cannell and Son, Swanley, also showed an excellent set of peas, among which Matchless, Lord Mayor, Talisman, Gradus, Epicure were very good. Mr. G. Lane, gardener to Miss Ridge, Highfield, Staines, sent half-a-dozen bunches of finely berried Black Hamburgh grapes. Mr. C. Maries, F.L.S., State garden-superintendent to the Maharajah Gwalior, exhibited some dried cabbage, cauliflower, and carrots prepared by him, and as used during the rainy season in India when vegetables are scarce. Messrs. J. Carter and Co.'s exhibit of culinary peas attracted much attention. The pods were fine, and well filled with large peas in every instance. Fifty varieties were shown, and among those Supreme, Lightning, Alderman, Early Morn, Daisy, Gradus, and Prince of Wales were first-rate.

MEDALS.

Silver-gilt Knightian to Mr. Owen Thomas, Frogmore Gardens, Windsor.

Silver-gilt Flora to Mr. Bristow, gardener to J. W. Temple, Esq., Groombridge.

Silver-gilt Banksians to Mr. H. B. May, Edmonton; to Mr. C. Blick, gardener to Martin R. Smith, Esq., Hayes, Kent.

Silver Knightian Medal to Messrs. J. Veitch and Sons, Chelsea, for strawberries and cherries.

Silver Flora Medals to D. Cooper, Esq., Newmarket; Mr. F. G. Foster, Havant; Mr. C. Turner, Slough; Mr. Baskett, gardener to Lord Penzance, Eashing Park.

Silver Banksian Medals to Messrs. J. Hill and Son, Edmonton; Messrs. Barr and Sons, Covent Garden; Messrs. H. Cannell and Sons, Swanley; Messrs. Paul and Son, Cheshunt; Messrs. J. Carter and Co., Holborn; Mr. F. W. Campion, Colley Manor; Messrs. F. Cant and Co., Colchester; Mr. H. Eckford, Wem.

Bronze Banksian Medals to Messrs. R. Wallace and Co., Colchester; and to Miss Ridge, Staines.

ROSE SHOW.

A SPLENDID rose show was held at the Drill Hall, Westminster, on the above date, and it proved conclusively that the Council was right in postponing the show from June till now. The competition was very keen. Ten in a class was the usual number of exhibitors, and in one case there were seventeen competitors. The roses were good.

AMATEURS.

In the class for eighteen trusses, distinct, the first prize was won by Mr. O. G. Orpen, West Bergholt, Colchester, with superb blooms of Mrs. J. Laing, Madame Cochet, Gustave Piganeau, Caroline Testout, Ulrich Brunner, Mrs. W. J. Grant, Cleopatra, Francois Michelon, Mrs. Sharman Crawford, A. K. Williams, Souvenir de S. A. Prince, Marquise Litta, Suzanne Marie Rodocanachi, Madame Hoste, Helen Keller, La France, Earl of Dufferin, and Kaiserin Augusta Victoria; Mr. Salter, gardener to T. B. Haywood, Esq., Woodhatch, Reigate, second; and Mr. C. J. Grahame, Wrydelands, Leatherhead, third. The best dozen roses were fine blooms of Etienne Levet, Caroline Testout, S. M. Rodocanachi, Mrs. Paul, Mrs. W. J. Grant, Ulrich Brunner, Mrs. J. Laing, Beauty of Waltham, White Lady, Francois Michelon, Marquise Litta, and La France, shown by Mr. E. Mawley, Berkhampsted; Mr. Mease, gardener to A. Tate, Esq., Leatherhead, second; and the Rev. J. Foster Melliar, Sproughton Vicarage, third.

The best half-dozen roses were shown by Mr. G. W. Cook, North Finchley, who staged Mrs. J. Laing, Francois Michelon, Etienne Levet, Mrs. W. J. Grant, Mrs. S. Crawford, and Earl of Dufferin; Mr. J. S. Thompson, Bounds Green, second; and Mr. P. G. Burnand, Reigate, third. Mr. Salter was first for nine blooms of one variety with Mrs. J. Laing; Mr. C. J. Grahame, second, with the same variety; and Mr. O. G. Orpen, third, with Kaiserin Augusta Victoria. For six blooms of one variety, Mr. G. W. Cook scored with fine specimens of Mrs. J. Laing; there were seventeen competitors, Mr. Mease coming second with Mrs. J. Laing; and Mr. E. M. Bethune, Deune Park, Horsham, third, with the same variety.

In the class for eighteen tea or noisette roses there was a very keen competition, but Mr. O. G. Orpen scored with a pretty stand that contained Cleopatra, Madame Cusin, Souvenir de Elise Vardon, Maman Cochet, Catherine Mermet, Innocente Pirola, Caroline Kuster, Corinna, Souvenir de S. A. Prince, Medea, Bridesmaid, Madame Hoste, and Comtesse de Nadaillac; the specification was for not less than twelve varieties. Mr. E. M. Bethune, second; and Rev. A. Foster Melliar, third. For a dozen blooms, teas or noisettes, in not less than twelve varieties, the Rev. W. H. Jackson, Stagden Vicarage, Bedford, was a good first, with Mr. J. T. Strange, Reading, second; and Mr. E. Mawley, third. Miss Langton, Hendon, led the way for half a dozen tea and noisette roses; Mr. R. W. Bowyer, Hertford, second; and Mr. J. Thompson, third. Mr. Orpen had the best dozen blooms of any tea or noisette rose, showing Souvenir de S. A. Prince in fine condition; Mr. C. J. Graham second, and Mr. R. W. Jackson third. For six blooms of one variety Mr. Bethune scored with The Bride; Rev. A. Foster Melliar second, with Souvenir d'Elise Vardon; and Mr. F. W. Flight third, with Madame Cochet.

OPEN.

For eighteen roses distinct, Messrs. D. Prior and Son, Colchester, was first with superb blooms of Lady Mary Fitzwilliam, Suzanne Marie Rodocanachi, Her Majesty, Helen Keller, Marchioness of Londonderry, Gustave Piganeau, Horace Vernet, Mrs. J. Laing, Comtesse de Ludre, Mrs. W. J. Grant, Alfred Colomb, Maman Cochet, La France, Marie Verdier, Marguerite Boudet, Duke of Fife, Caroline Testout, and Camille Bernardin; Messrs. F. Cant and Co., Colchester, second; and Messrs. Paul and Son, third. In the open class for eighteen tea roses, distinct, Messrs. D. Prior and Son, Colchester, secured first prize with Madame Watteville, Catharine Mermet, Innocente Pirola, Maman Cochet, Caroline Kuster, Ernest Metz, Jean Ducher, Souv. de un Ami, Maréchal Niel, Souvenir de S. A. Prince, Madame Hoste (a grand flower), Comtesse de Nadaillac, Ethel Brownlow, The Bride, Media, Bridesmaid, Corinna, and Madame Cusin; Mr. G. Prince, Oxford. second; and Messrs. Paul and Son, third.

NEWCASTLE HORTICULTURAL SOCIETY, July 13, 14, and 15.

THE exhibition held at Newcastle on the above dates was a fine one, the exhibits being both numerous and good. The whole display was under one enormous canvas erection that would make the largest marquee at the Temple Show look small beside it. Sixty-five classes were provided, and the majority were open. With regard to quality, the fruit was very good, the cut hardy flowers especially fine; indeed, we have never at any show seen such a grand display of first-rate subjects. There was a good competition in the group and decorated fire-place classes, but the exhibits were by no means first-class, and we have seen some of the competitors do much better previously. The floral decorations were splendid, as may be expected when the Messrs. Perkins, of Coventry, show largely. Non-competitive displays were a feature, and especial praise is due to Messrs. J. Veitch and Sons, Mr. Forbes, of Hawick, Messrs. William Paul and Son, and Messrs. Backhouse and Co., of York, for their groups.

GROUPS AND PLANTS.

In the class for a group of miscellaneous plants, arranged to produce artistic effect, the first prize of £10, together with the R.H.S. silver Banksian medal, was won by Mr. J. McIntyre, gardener to Mrs. Gurney Pease, Darlington, with a tasteful production that needed, to our mind, a few more bright flowers to make it first class. The group was composed of a series of mounds of varying height, arranged over a ground-work of moss and mirrors (to represent water); crotons, dracænas, coleuses, alocasias, cypripediums, and caladiums were dotted about, and a few small oncidiums graced the larger mounds with their spikes. We have seen better groups arranged by Mr. McIntyre. Mr. J. Farquharson, gardener to R. O. Lamb, Esq., West Denton, Scotswood, was second, but he had lumped his plants too much; Mrs. B. Jennings, Haymarket, Newcastle, third; and Mr. Edmondson, Green Market, Newcastle, fourth.

Mr. F. Nicholas, gardener to the Earl of Zetland, Upleatham, had the best half-dozen specimen flowering plants, his Stephanotis floribunda and Erica ventricosa Bothwelliana being very well finished. Mr. Nicholas was also first for four plants in bloom with Anthurium Scherzerianum, Dipladenia bolivensis, Aphelexis rosea, and Erica depressa. Mr. T. Wilkinson, Croydon Road, Newcastle, was a leading exhibitor of fuchsias, &c., in the amateurs' division; and Mr. Park was also successful for coleus, &c. Mr. J. Morris, Felling, was second for six flowering plants. Mr. J. McIntyre had the best six foliage plants, showing large examples of popular palms, Cycas siamense, and some handsome crotons; Mr. Nicholas second; and Mrs. B. Jennings third. Mr. McIntyre and Mr. Morris gained first and second places respectively for three specimen crotons.

Mr. T. Battensby, Hagg Hall, Blagdon, had the best decorated fireplace and mantel, using coleus, irises, and variegated rubus sprays to advantage; Mrs. Jennings second, and Mr. McIntyre third. Five fireplaces were decorated, but the art displayed was not of the highest order.

ROSES.

Messrs. Perkins and Sons, Coventry, secured the first prize for a collection of roses arranged for effect, and with the prize went a bronze medal. There were wreaths of specimen roses, chiefly pink and red and rose forms; baskets of yellow and crimson roses, epergnes of pink and white roses; bouquets of crimson, white, yellow, and red roses, and hanging baskets of delightful sprays of Penzance briars—a pretty and sweetly fragrant display. The second prize fell to Messrs. D. and W. Croll, Dundee, who staged beautiful baskets of tea roses over bunches and boxes of excellent blooms; Messrs. Harkness and Sons, Bedale, Yorks, third. The competition was keen.

For seventy-two roses not less than twenty-four varieties, to be shown in triplets, Messrs. Harkness and Sons, Bedale, were well first with an even and fresh set of blooms; Suzanne Marie Rodocanachi was very fine. The Messrs. Croll, of Dundee, came second, and Messrs. G. and W. Burch, Peterborough, third.

Messrs. Harkness and Sons won the first prize for four dozen roses, distinct with fresh flowers of Mrs. J. Laing, Suzanne Marie Rodocanachi, Heinrich Schultheis, Horace Vernet, Francois Michelon, Marie Baumann, Mrs. Harkness, Duchesse de Morny, Her Majesty, Gustave Piganeau, Marchioness of Dufferin, Ulrich Brunner, Marchioness of Londonderry, Marie Verdier, Helen Keller, and Duke of Edinburgh, in the back row; Alfred Colomb, Kaiserin Augusta Victoria, General Jacqueminot, Niphetos, Duke of Fife, Madame Cusin, Etienne Levet, La France, Marquise Litta, Caroline Testout, Fisher Holmes, Madame Hoste, Comtesse de Ludre, Souvenir d'Elise Vardon, Mons. A. Dumesnil, and Lady Mary Fitzwilliam, in the middle row; Souvenir de S. A. Prince, Earl of Dufferin, White Lady, Crown Prince, Danmark, Anna Olivier, Duke of Wellington, Margaret Dickson, Duchesse de Vallambrosa, Madame Delville, Madame Gabriel Luizet, Prince Arthur, Souvenir d'un Ami, Captain Hayward, Marchioness of Devonshire, and Star of Waltham, in the front row; there were four competitors, Messrs. R. Mack and Son, Catterick, coming second and Messrs. D. and W. Croll, Dundee, third. In the class for three dozen blooms, Messrs. Harkness and Sons were again first, Messrs. D. and W. Croll second, and Messrs. G. and W. Burch, Peterborough, third.

Messrs. Harkness and Sons also secured the chief award for twelve roses, showing grand specimens of Mrs. J. Laing, Ulrich Brunner, Her Majesty, Francois Michelon, Mrs. S. Crawford, Marchioness of Londonderry, Duke of Teck, Caroline Testout, Madame Gabriel Luizet, Captain Hayward, Baroness Rothschild, and La France; Messrs. R. Mack and Son second; and Messrs. G. and W. Burch third. The first prize for twelve blooms of one variety was won by Messrs. Harkness and Sons with Mrs. J. Laing, a fine dozen; Messrs. D. and W. Croll second, with Lady Mary Fitzwilliam; and Messrs. G. and W. Burch third, with Her Majesty. In the division open to gardeners, the first prize three dozen roses in triplets, Mr. R. Park, Bedale, was first, and he also scored for a dozen blooms distinct, besides winning first for twelve flowers in the amateurs' division.

HARDY FLOWERS.

The class for twenty-four bunches of hardy herbaceous or border flowers, roses excluded, resulted in a most dazzling display of beautiful blooms, and as the view included other classes for hardy flowers, the effect can be better imagined than described. Messrs. J. Cocker and Sons, Aberdeen, took leading honours with magnificent and tastefully-arranged bunches of Delphinium Argus, Figaro, and a seedling; Dictamnus fraxinella alba, Pæonies Triumphans, Henry Demay, and Festiva, Centranthus ruber, Lilium martagon album, L. longiflorum giganteum, Thalictrum angustifolium, Gladioli Colvillei The Bride, G. delicatissima, Eryngium alpinum, Iris Leander, I. Blue Emperor, I. Snowball, I. Belle Chinoise, Inula glandulosa, Aquilegia cærulea, Geum coccineum fl.-pl., Gaillardia Penelope, Heuchera sanguinea, and Helenium Balanderi; Messrs. Harkness and Sons, Bedale, second; and Mr. F. Edmondson, Green Market, Newcastle, third.

There were five exhibitors in the class for eighteen bunches of hardy flowers, and here Messrs. J. Cocker and Sons again proved themselves the foremost competitors; Messrs. Harkness and Sons came second, and Mr. Edmondson third. In the amateurs' division, Mr. W. Hutchinson, Kirkby Moorside, had the best half-dozen bunches of hardy flowers; Mr. T. Battensby, Hagg Hall, Blagdon, second. For a dozen bunches Mr. Hutchinson was also first, his set including a splendid bunch of Campanula grandiflora.

FLORAL DESIGNS.

Messrs. Perkins and Sons, Coventry, were to the fore in this division, gaining first prize for a bridal bouquet in which orchids were to be used; Mr. T. Battensby second. The Messrs. Perkins were first for a bridal bouquet, arranging a lovely design in odontoglossum and lily of the valley; Mrs. B. Jennings, Haymarket, Newcastle, third. The Coventry firm showed the best basket of flowers—orchids excluded—having a charming design in crimson carnations and dipladenias and roses; Mr. T. Battensby second. For a drawing-room epergne Mr. Edmondson was a good first with a bright and elegant design in cattleyas, liliums, gladiolus, and grasses; Mr. G. Webster, Sunderland, second, and Mr. T. Battensby third. Messrs. Perkins and Sons again scored a first in the class for a hand bouquet, arranging ixoras, roses, and stephanotis tastefully. The same firm led the way for a twelve-inch basket of cut flowers, showing masdevallias and odontoglossums finely; they were also first for a hand bouquet of orchids with a costly and gorgeous design.

FRUIT.

The fruit display was an extremely good one. In the principal class for a collection of eight dishes, Mr. J. H. Goodacre, gardener to the Earl of Harrington, Elvaston Castle, won the first prize with Cannon Hall Muscat and Black Hamburgh grapes, finely berried; Queen pineapple, Barrington peaches, Countess Melon, Lord Napier nectarines, Brown Turkey figs, and lovely Astrachan apples; a very fine set of fruit. Mr. J. McIndoe, gardener to Sir J. W. Pease, Bart., M.P., Hutton Hall, Guiseborough, was second, showing Chasselas Napoleon grapes, Clapp's Favourite pears, and Yorkshire Beauty melon in fine condition. Mr. J. Tullett, gardener to the Right Hon. Lord Barnard, Raby Castle, Staindrop, third. There were five exhibitors. The best four dishes of fruit were staged by Mr. Goodacre, who this time showed Black Hamburgh grapes, Pineapple nectarines, Hero of Lockinge melon, and Bellegarde peaches; Mr. J. McIndoe, second; and Mr. G. Lonsdale, gardener to R. H. Appleton, Esq., Woodside Hall, Eaglescliffe, third. Mr. Goodacre again led the way, and gained a silver Banksian medal for four bunches of grapes, with braces of Muscat Hamburgh and Madresfield Court; Mr. McIndoe second, with Madresfield Court and Chasselas Napoleon, the latter well finished; Mr. J. Tullett third. Mr. R. Strickland, gardener to F. W. Backhouse, Esq., Sunderland, had the best white grapes, with White Frontignian; Mr. McIndoe second, with Muscat of Alexandria; and Mr. G. Lonsdale third, with the same variety.

Messrs. Tullett, Goodacre, and McIndoe shared the leading awards for melons; Mr. Goodacre had the best peaches, beautifully finished examples of Royal George; Mr. F. Nicholas, gardener to the Earl of Zetland, Upleatham, second with Dymond. For nectarines Mr. Goodacre led with Lord Napier; Mr. Tullett second with the same; and Mr. McIndoe third with Byron. Messrs. McIndoe, Goodacre, and Lonsdale took the prizes for cherries with grand dishes of fruit.

Mr. McIndoe scored for a pair of bunches of any white grape, exclusive of Muscat of Alexandria, showing Duke of Buccleuch; Mr. Goodacre second with Foster's Seedling. Mr. Goodacre showed the best brace of bunches of Black Hamburgh grapes, and Mr. Lonsdale was a good second. For any other black grape, Mr. McIndoe scored with Madresfield Court, and Mr. Goodacre came second with handsome clusters of Gros Maroc. Royal Sovereign strawberries from Mr. Blackwood, gardener to Lord Decies, Belsay, won first prize; Mr. G. Macfarlane, Alnwick, second; and Mr. Goodacre third. For six dishes of strawberries Mr. Macfarlane was first, showing John Ruskin, Sir J. Paxton, Royal Sovereign, Noble, Sharpless, and Scarlet Queen.

VEGETABLES.

Mr. J. McIndoe took first prize in the class for a collection of vegetables, prizes offered by Messrs. Webb and Sons, Stourbridge; the same competitors also took the first place in a class for a collection of vegetables, provided by Messrs. Sutton and Sons, Reading. In both displays Mr. McIndoe had fine celery, peas, French beans, and tomatos. He was the only exhibitor. Mr. Lonsdale showed the best tomatos, Sutton's Perfection.

NON-COMPETITIVE DISPLAYS.

Messrs. J. Veitch and Sons put up a magnificent exhibit of plants occupying about five hundred square feet, graceful palms and bamboos, with splendid caladiums and heliconias made a most effective background for mounds of brilliant Javanico-jasminiflorum rhododendron hybrids, lily of the valley, cannas, Kalosanthes coccinea (grandly grown), gorgeous crotons, heaths, nidulariums, gymnogrammas, streptocarpuses, &c. In the central portion, near the front, were a few fine orchids, such as Cattleya eudora, C. gigas, Cypripedium superbiens, Epidendrum vitellinum majus, Mormodes grandinum, Lælia purpurata, Lælio-cattleya Canhamiana alba, and the pretty Sophronitis Veitchi. This was a first-rate exhibit, though a little more finish along the front line would have improved its effectiveness. Messrs. H. Cannell and Sons, Swanley, put up a gorgeous display of cannas grown in the usual fine style that one expects from the Home of Flowers. All the best varieties were staged, including the Austria and Italia group.

An extensive, fragrant, and beautiful display of roses was arranged by Messrs. Wm. Paul and Son, Waltham Cross, who staged big baskets of flowers of new varieties. To name a few that were especially attractive—Spencer, Caroline Testout, Madame J. Grolez, Louis Von Houtte, Her Majesty, Captain Christy, Belle Siebright, Helen Keller, The Bride, Ethel Brownlow, Maman Cochet, and Vicountess Folkestone. There was also a box of Waltham Cross Seedlings. The whole display consisted of fourteen "two-dozen" boxes, and two dozen baskets each holding about fifty flowers of a variety. A few more plants among the baskets and boxes would have improved the exhibit vastly; the roses, however, were grand. Messrs. J. Backhouse and Son, York, had a charming show of hardy flowers, putting them up on a miniature rockery of elegant design. Campanulas, Orchis foliosa, Cypripedium spectabile, Romneyi Coulteri, Adiantum pedatum, were well shown. Water lilies were not well enough in flower to be properly effective. Stove plants were staged in fine condition, and the group of orchids and new plants came in for a large share of admiration.

Mr. J. Forbes, Hawick, showed a splendid set of phloxes and pentstemons, staging such glorious spikes of big blooms that are seldom seen in the drier southern counties. A spike of Pentstemon Fivelich was twenty-three inches long. Delphiniums were equally grand, and we have to regret that limits of space prevent us naming a few sorts; half-a-dozen fine pentstemons were Jean Mace, Legende, Alfred Hamband, Charles Dickens, George Groves, and Cigale. Messrs. Little and Ballantine, Carlisle, put up a handsome group of palms, crotons, caladiums, &c., interspersed with Cupid sweet peas; the firm also showed their new variegated holly, Golden King. Messrs. R. Wallace and Co., Colchester, surpassed themselves with a charming display of liliums in wonderful variety; the calochorti proved a great attraction, and certainly they were splendid; Hemerocallis aurantiaca major naturally occupied a prominent position, and there were fine bunches of Gladiolus Colvillei in variety, Iris gigantea, Iris Kæmpferi, and alstrœmerias. Messrs. Edwards and Sons, Nottingham, showed fancy fern and flower stands. Messrs. W. Fell and Co., Hexham, put up a charming lot of garden roses in large bunches. Mr. S. Pye, Caterall, Garstang, showed pansies and violas in splendid condition; the violas were in bunches of twelve [illegible], and such sorts as A. J. Rowberry, Mrs. Crane, Lucy Bertram, Pembroke, Marchioness, Magic, Ardwell Gem, and Isa Fergusson were especially effective. The Messrs. W. Fell and Co., Hexham, contributed a beautiful group of specimen conifers arranged in a groundwork of palms, hydrangeas, ferns, cannas, &c. Retinospora plumosa aurea is a grand conifer and grandly shown by this firm. Messrs. J. Robson and Sons, Hexham, were also extensive exhibitors of conifers, [illegible], euonymuses, Hydrangea paniculata, Acer negundo variegata, &c., all edged with variegated vincas and making up a showy display near the entrance. Messrs. Laing and Mather, Kelso, showed a pretty little group of carnations, both Malmaison and other varieties. Malmaison carnations shown by Mr. Goodacre, gardener to the Earl of Harrington, Elvaston Castle, were grouped effectively, and made a bright exhibit that was a centre of attraction. Violas and pansies from Mr. A. Lister, Rothesay, were notably bright, large and fresh, and deserved all the admiration they received.

Mr. J. Hudson, gardener to Leopold de Rothschild, Esq., Gunnersbury House, Acton, showed a superb lot of water lilies almost entirely of Nymphæa Marliacea. All the flowers were cut from the lake at Gunnersbury, and with the exception of the blue N. zanzibarensis, none had been afforded protection during the winter, but this one grows in warm water. N. Marliacea chromatella, N. M. rosea, and N. M. albida were gloriously beautiful. The water lilies were one of the leading features of a fine show. Mr. James Douglas staged carnations finely; Trumpeter, red; Elfin, white; Nell Gwynne, white; and Lady Grimston, rose and scarlet, were especially fine. A charming group of Spanish and English irises was put up by Messrs. J. Cocker and Sons, Aberdeen; the bunches were large and the flowers first-rate; about six dozen bunches were staged, and the effect was splendid. To those from the South this late display of irises was a great treat.

AWARDS OF THE ROYAL HORTICULTURAL SOCIETY.

A deputation of the Royal Horticultural Society consisting of the President, Sir Trevor Lawrence, Bart.; the Treasurer, P. Crowley, Esq., F.L.S.; the Secretary, Rev. W. Wilks, M.A.; and Messrs. C. Shea, A. Pearson, G. Paul, G. [illegible] Yeld, J. Wright, A. Turner, and J. O'Brien, made a tour of the exhibition in the morning, and made the following awards: *First Class Certificate* to the Hodgkin Holly Golden King from Messrs. Little and Ballantine, Carlisle. *Gold Medal* to Messrs. J. Veitch and Sons, Chelsea, for group of plants. *Silver-gilt Flora* medals to Messrs. Wm. Paul and Son, Waltham Cross, for roses; Messrs. J. Backhouse and Co., York, for hardy plants and orchids; and to Mr. J. Forbes, Hawick, N.B., for pentstemons, phloxes, and delphiniums. *Silver-gilt Banksian* medal to Messrs. R. Wallace and Co., Colchester, for lilies and calochorti. *Silver Flora* medals to Messrs. J. Cocker and Sons, Aberdeen, for cut hardy flowers (first prize set); to the same firm for Spanish irises; Messrs. H. Cannell and Sons, Swanley, for cannas; Messrs. Perkins and Sons, Coventry, for first-prize display of roses. *Silver Banksian* medals to Mr. J. Hudson, gardener to L. de Rothschild, Esq., Gunnersbury House, Acton, for water lilies; Mr. A. Lister, Rothesay, for stands of violas and pansies; Messrs. Harkness and Sons, for twelve blooms of Mrs. J. Laing rose; Mr. Goodacre, gardener to the Earl of Harrington, Elvaston Castle, for his first-prize collection of fruit; Mr. McIndoe, gardener to Sir J. W. Pease, Bart., M.P., Guisborough, for second-prize collection of fruit; Mr. J. McIntyre, gardener to Mrs. G. Pease, Darlington, for groups of plants; and to Mr. S. Pye, Garstang, for violas. *Bronze Flora* medal to Messrs. Harkness and Sons, Bedale, for hardy flowers.

LUNCHEON.

At the conclusion of the judging and making awards the Newcastle Society entertained the R.H.S. deputation, the judges, the committee, and the pressmen at lunch at the Grand Hotel. The President, Riley Lord, Esq., J.P., of Highfield Hall, Gosforth, presided, and was supported by Sir Trevor Lawrence and Alderman J. Baxter Ellis, J.P. After a well-served luncheon the usual loyal toasts were given and received. Then the President rose to propose "Continued Success to the Royal Horticultural Society." He commenced by remarking that the show of that day was larger and better than usual, and the reason, he considered, was that it had become well-known that the R.H.S. would send a deputation to Newcastle with a view to encouraging horticulture. He was happy to find the weather so pleasant, and he hoped that the success financially would be as great as it had been in other directions. The Newcastle Society was doing the right work in the North of England, and he felt sure that the Royal Horticultural Society was doing right in coming to them and recognizing the Newcastle display as one of the best in the provinces. There would naturally follow an exchange of ideas upon such an [illegible] and he thought that both societies would be greatly benefited. Briefly alluding to the age of the R.H.S., Mr. Lord referred to the enthusiasm and perseverance that had belonged to horticulturists of all times as shown by the position of the parent and many other societies. He was delighted, as they all were, to welcome the deputation to Newcastle, and they felt it a great honour to have among them so many influential horticulturists who had willingly given their time and travel so many miles to pay Newcastle a visit. He thanked the deputation on behalf of his society, and in proposing the toast coupled with it the name of Sir Trevor Lawrence, Bart.

Sir Trevor, who was most enthusiastically received, returned thanks on behalf of the deputation for the reception accorded them, and for the kindness and hospitality so freely extended to all the members. This was the fourth year that the Royal Horticultural Society had sent deputations into the country to visit the [illegible] provincial exhibitions, and wherever these had gone they found much to [illegible], interest, and instruct, so that the idea had proved most successful. He was glad to learn that the Newcastle Society was only twenty years younger than the R.H.S., and that it had always been consistent, holding a horticultural exhibition each year of its existence. His opinion of the show was that it was a good one, and in some departments, especially hardy flowers and roses, it was exceptionally good, scarcely too much could be said in praise of the hardy flowers staged in such grand bunches. The deputation also thought Mr. Forbes' pentstemons, phloxes, and delphiniums extremely good. Sir Trevor then advised the Newcastle Society to keep to its own business, for only by so doing could they hope to be successful. He instanced the reverses of the R.H.S. when it departed from the strict line of duty, and showed how it had, during late years, fulfilled its proper functions, and increased both membership and reserve fund. The fortnightly meetings were now extremely good and popular; it was often difficult to find exhibitors all the space they wished for, while the attendance was fashionable and large. The reserve fund was now about £7,000. Stick to horticulture was the text of Sir Trevor's speech, and in his concluding remarks he pointed out the influence horticulture had upon the masses, illustrating his point by stating that in the country it was pretty safe to expect a clean, well-kept interior to a cottage which had a well-kept garden attached, and *vice versa*.

"Success to the Newcastle Society" was the toast ably proposed by Mr. Charles E. Shea, who said that the deputation had not come out to make speeches but as practical horticulturalists. It seemed quite unnecessary to wish health and success to a society that was so vigorous and healthy as that of Newcastle, as evidenced by the show they had just left. With regard to the exhibition, he had certainly never seen a grander display of hardy flowers than the show held, and some of the flowers he had never seen better represented, notably Heuchera sanguinea. Referring to Sir Trevor's remarks, anent the wide spread influence of horticulture, Mr. Shea alluded to the good work being done in the East end of London by the People's Palace Horticultural Society, and spoke highly in favour of any movement that would increase the love of flowers and plants in the hearts of the poorest of people and so enlighten the m and brighten their lives and homes. Mr. Shea concluded by thanking the society for the hearty reception of the R.H.S. deputation, and hoped all the success deserved might attend the present show. This toast was ably responded to by Alderman J. B. Ellis, J.P., who expressed the indebtedness the Newcastle Society felt to the R.H.S. in being honoured by so influential a deputation as they had had the pleasure of receiving. He spoke of the reverses his society had undergone and referred in high terms to the grand way in which the wealthy folk of the Newcastle district had always rallied round them on such occasions. The toast of "The Mayor and Corporation" concluded the pleasant proceedings.

LEE AND BLACKHEATH HORTICULTURAL SOCIETY,

July 6 and 7.

THE annual exhibition of this admirably managed society was held in the grounds of Cedar House, the residence of Mrs. Penn, and, as usual, was so thoroughly good in its leading features as to indicate horticultural skill of a high order in the district. Plants, groups, and cut flowers were of great excellence, fruit was somewhat below the high average of previous years, but vegetables were staged in immense quantities and excellent condition.

GROUPS OF PLANTS were more tastefully arranged than at any of the previous exhibitions of the society, and, as the entries were numerous, they constituted a very pleasing feature. Mr. F. Fox obtained premier honours for a surprisingly beautiful arrangement, and Mr. J. Lambert and Mr. C. Nunn, who were second and third, with groups of which they had good cause to be proud. Tables of plants were not less satisfactory than the groups, and in the class for these Mr. F. Fox was again first, having an elegantly arranged table; Mr. J. Amey and Mr. E. Dove were second and third with good tables, although the plants were rather crowded. Collections of twenty-four plants in pots not exceeding eight inches in diameter formed, as usual, a strong class, and the numerous collections produced an effective display. The successful competitors were Messrs. W. Payne, F. Fox, T. Aley and C. Birch, to whom the prizes were awarded in the order of their names.

STOVE AND GREENHOUSE PLANTS continue to receive the attention in the district they so well merit, and numerous well-grown collections were staged in the several classes. There were four competitors for the prizes offered for twelve flowering and foliage plants, and the awards were made in favour of Mr. C. Nunn, Mr. F. Fox, and Mr. C. Saville, all of whom had finely-grown specimens. The best six specimens were contributed by Mr. C. Birch, Mr. F. Fox, and Mr. T. Aley; and the successful competitors in the class for four were Mr. C. Nunn, who had a finely-flowered example of Stephanotis floribunda, and Mr. C. Birch. Ornamental-leaved plants, were superbly shown; and the prize takers in the class for six were Mr. J. Lambert, who had two richly-coloured crotons, Mr. C. Nunn, and Mr. W. Payne. The finest single specimen in bloom was a large example of Ixora Williamsi, contributed by Mr. C. Birch, and selected for the award of the silver medal offered for the exhibit evincing the highest cultural skill. Mr. C. Nunn contributed to the class a densely-flowered example of Clerodendron Balfourianum. Mr. Lambert obtained premier honours for a specimen fine foliage plant, and also for six dracænas, the latter being well coloured, especially good also were the four dracænas from Mr. T. Aley, who was awarded the first prize. Caladiums were represented by several collections, each consisting of large splendidly-coloured specimens. The finest examples were contributed to the class for six, in which the prizes were awarded to Mr. C. Nunn, Mr. W. Payne, and Mr. F. Fox. Mr. H. Horton obtained premier honours for six gloxinias, and for the same number of tuberous begonias, with excellent examples. There were numerous other classes, and the chief prize winners were the exhibitors whose names have been already given.

FERNS were staged in considerable numbers, and the several collections were of a high order of merit. There was a strong competition in the class for six exotics, and in the result Mr. C. Birch, Mr. W. Payne, and C. Nunn were awarded the prizes in the order of their names. For four, Mr. J. Lambert and Mr. A. W. Lower were first and second, and the first prize for six hardy kinds was awarded to Mr. C. Saville, who had medium-sized and well-finished examples of excellent forms.

CUT FLOWERS were strongly represented, and chief among them were the roses for which several open classes were provided. Two rose classes were for nurserymen, one for forty-eight and one for twenty-four, and in each of these Messrs. G. and W. H. Burch were first with blooms remarkable for their freshness and finish. Mr. J. R. Box was second in the two classes with excellent blooms, and Messrs. B. Muller and Son were third in each class. In the division open only to gardeners and amateurs Mr. G. W. Cook was first for twenty-four, twelve, and six distinct, for six blooms of one variety; and in a special class, in which the prizes were offered by Messrs. Burch, he obtained premier honours. Mr. J. Browning was second for twenty-four distinct, six blooms of one variety, and first for twelve teas; and Mr. J. Bateman was second for twelve and six distinct. Mr. J. Lambert was successful in taking premier honours for three stands for the dinner table and one epergne with tasteful arrangements. Mr. Saville had the best stand of cut flowers, and Mr. Judge the best button holes.

FRUIT was, on the whole, below the average, and does not call for detailed notice. The chief awards in the several classes were made in favour of Mr. E. Dove, Mr. J. Arney, Mr. E. Longley, and Mr. Weller.

VEGETABLES were of a high degree of excellence, and it would be difficult to speak too highly of the collections. There were two classes for these, and in that for a collection without limit as to the number of kinds Mr. E. Dove occupied the first place, Mr. F. Fox and Mr. C. Nunn the third; and in the class for six kinds, in which the prizes were provided by Messrs. Sutton and Sons, Messrs. Dove and Fox were first and second respectively.

The arrangements were, as usual, remarkable for their completeness, and did much credit to Mr. C. Helmer, who has occupied the position of secretary upwards of twenty years.

CHERTSEY, WALTON, AND WEYBRIDGE, July 7.

The thirty-third annual summer exhibition was held in the grounds of Oatlands Lodge, Weybridge, on the date named, and was in every way a success. The competition was keen, and the exhibits were well up to the average in point of quality, a commendable display being made. The arrangements were, as usual, well carried out by Mr. T. J. Rawlings, who has since the inception of the society held the reins of office of secretary. The exhibits were arranged in three tents, one being occupied with the groups of miscellaneous plants arranged for effect, a larger one containing the specimen plants, while another was required for fruit, vegetables, and cut flowers.

The Groups were an interesting feature. In the principal class there were three entries, but these produced a good display. Mr. J. Lock, gardener to Mr. C. Swinfen Eady, Q.C., easily secured the leading award with a charming arrangement of suitable plants set up in semi-circular style with the usual accompaniment of cork, water, and arches, the whole producing a harmonious display. Mr. C. J. Cook, gardener to J. G. Sassoon, Esq., Walton-on-Thames, took second position with a bright, yet more formal, arrangement. Mr. J. Ashdown, gardener to Major Collis Brown, Broad Oak, Byfleet, was third. In a minor group there were three exhibitors also. Mr. H. Prothero, gardener to Miss Green, Weybridge, secured the leading award for a bright, yet rather too stiffly-arranged, group of suitable plants. Mr. W. C. Pagram, gardener to J. Courtenay, Esq., The Whin, Weybridge, second; while Mr. A. Millican, third.

Stove and Greenhouse Plants were freely staged, some difficulty being experienced in accommodating properly all that were sent. For eight miscellaneous plants, not less than four to be in flower, Mr. J. Lock secured the leading award with specimens showing high cultivation. Mr. Lock also won for four specimens in flower. In the class for six foliage plants, Mr. T. Osman, gardener to J. L. Baker, Esq., Ottershaw Park, Chertsey, was premier prize-taker with healthy examples of Cycas cincivalis and Kentia Fosteriana. Mr. Lock followed closely for second prize. These two exhibitors won first and second prize in the order here placed for one specimen flowering plant, Mr. Osman staging a well-flowered Anthurium Scherzerianum.

Ferns were creditable to the exhibitors concerned, the plants numerous, while the general health and quality of the exhibits left little to be desired. Mr. Lock won premier award for six, staging good plants of pleasing variety of rude health. Mr. Osman followed with specimens, but little inferior. Hardy ferns were grandly staged by Mr. Millican, who had a superb specimen of Adiantum pædatum.

Soft-Wooded Plants.—Gloxinias were staged in large numbers, and of extra fine quality. Mr. Stedman, gardener to H. F. Burke, Esq., Weybridge, secured first prize with grandly flowered specimens, such as is seldom seen; Mr. E. Watford, gardener to A. J. Rhodes, Esq., Weybridge, second. For six fuchsias, Mr. J. Dabona, gardener to Mrs. Cobbett, Weybridge Heath, won for freely flowered examples not too formally trained. Mr. Osman secured the leading award for four coleus with pyramidal trained specimens, bright in colour. Begonias were numerous, bright, and good. Mr. Stedman won for six single, and for six double flowered also, Mr. Millican winning for four plants. Mr. Osman contributed the prize-winning caladiums in four varieties, really good examples, showing much cultural skill. Streptocarpus made an interesting exhibit, so numerous were they, and so good in quality. Mr. J. Buxton, gardener to J. A. Forster, Esq., Fernlands, Chertsey, secured the leading award.

Cut Flowers were an attractive feature of the show. Roses were numerous and good. Mr. Will Taylor, Hampton, Middlesex, won for twenty-four distinct, with bright coloured examples of popular varieties. Mr. J. Tomlin, gardener to Mrs. Goldringham, second. Mr. Prothero secured the leading award for twelve trebles, with fresh examples, if somewhat small. Herbaceous flowers were an interesting feature of the show. Mr. Jinks, gardener to E. Druce, Esq., The Beeches, Walton, won with a representative collection of twelve varieties.

Fruit made an interesting feature. Black grapes were numerous and good in quality. For two bunches Mr. Sadler, gardener to Mrs. Tulk, Cowley House, Chertsey, won premier position with huge clusters of Black Hamburgh, good in every respect. Mr. I. Osman second, with neat examples. For two bunches any white grape Mr. Lock, with very fine specimens of Foster's Seedling, secured the premier position. Mr. Osman, with medium-sized Buckland Sweetwater, was second. Mr. Jinks, with Goshawk, won premier position for one dish peaches. Mr. Lock secured a similar place for nectarines with well coloured fruit of Dryden. The last-named, with Royal Sovereign, won premier place for one dish of strawberries. Melons were well shown, Mr. Prothero being first with Empress.

Vegetables were thoroughly well represented. Mr. A. Basile, gardener to C. L. Powell, Esq., Woburn Park, Weybridge, won the leading place for eight varieties with a faultless collection. Mr. Osman second.

Non-competitive Exhibits were interesting and appreciated. Mr. W. Baxter, Woking, staged two dozen violas, well representing this popular flower in its best character. Messrs. Barr and Son sent a thoroughly representative collection of herbaceous flowers; it is needless to say these were much admired, and proved a capital object lesson to the numerous visitors and admirers. Mr. Will Taylor sent a collection of roses, embracing H.P. and garden varieties in quantity. Messrs. J. Laing and Son, Forest Hill Nurseries, arranged a representative collection of stove and greenhouse plants at the entrance to the principal tent. Messrs. Jackman, Woking, contributed roses and herbaceous flowers numerously and well. Messrs. Fletcher showed roses and herbaceous flowers.

HIGHGATE HORTICULTURAL SOCIETY, July 8.

The thirty-ninth annual exhibition of this society was held on the above date in the prettily-situated grounds of Northwood, Hornsey Lane, and appears to have taken a new lease of life, judging from the pleasing display on this occasion. The larger tent was well filled with exhibits from the trade and the professional element of the neighbourhood, the smaller one displaying the products of the amateur and cottage members of the society. In each case there was evidence of good culture, showing that growers in the northern heights are able still to make a show worthy of such an old-established society.

Groups, as usual here, were the strongest feature of the display, and in a great degree were successful in making a very pretty show. For a group of flowering and foliage plants, arranged for effect on a space nine feet by six feet, a beautiful combination secured first prize for Mr. H. Eason, gardener to Mr. B. Noakes, North Hill, Highgate. This was neatly and effectively set up, and the flowering and foliaged plants well balanced. Second prize was secured by Mr. E. H. Chitty, gardener to Mr. S. Hardy, Cholmely Lodge, Highgate, for a meritorious arrangement. Only one competitor was forthcoming in a class for a group of exotic ferns, caladiums, and coleus, and the first prize was deservedly awarded to Mr. J. Brooks, gardener to Mr. Walter Reynolds, J.P., The Grove, Highgate. A spirited competition resulted in the mixed group open to single-handed gardeners, and a brave show was made. Mr. T. L. Tark, gardener to Mr. T. Laney, Southwood House, was a good first with a fine, bold arrangement, in which taste and artistic merit in the disposition of the plants were displayed; second prize was gained by Mr. J. Adams, gardener to Mr. E. H. Smithett, Hillside, Fitzroy Park, who had a nice group, and third prize was won by Mr. G. Sanders, gardener to Mr. W. Hayes, Gloucester House, Highgate, with a less bright display than the others. A really fine show was made in the group of flowering plants, and the exhibit which secured the leading position for Mr. J. Brooks, was of a high order of merit. Mr. T. Turk also had a handsome group, for which second prize was awarded. For six exotic ferns, Mr. Brooks was a good first, showing capital individual specimens; Mr. Eason, second; and Mr. Adams, third. Gloxinias were in magnificent form, and in a class for six plants, Mr. Turk was first with specimens freely flowered, of large size, and of good colour; Mr. H. Eason was an uncomfortably close second with somewhat dwarfer plants; Mr. J. Sandford, gardener to G. W. Wright-Ingle, Wood House, North Finchley, also had a grand lot of plants for third prize. Tuberous begonias were freely shown in each division, the principal class for six plants resulted in Mr. Sandford being placed first, Mr. J. Brooks following, and Mr. Saunders, third. A class for six foliage plants found Mr. Eason in the premier position with worthy specimens, and Mr. Brooks was placed in the second position, also with a fairly good lot of plants.

Cut flowers at Highgate are generally strongly represented, and the present occasion was no exception to the rule. The leading class was one for a collection of hardy cut flowers, and in this a grand lot of flowers were staged. Mr. T. Parkins, Highgate, was placed first with a thoroughly representative display, and neatly set up, the collection securing second prize being much larger, but not well staged. Many of the subjects were so intermixed that really excellent flowers were hidden. Mr. G. W. Cook, The Briars, North Finchley, won first prize for twelve cut roses distinct, with remarkably fine blooms. These were large handsome flowers of good colour and splendid form and substance, and were a long way ahead of the second prize, won by Mr. Cope; Mr. Cope was placed third. Violas were also well shown, the stand of twelve sprays as shown by Mr. D. B. Crane, Woodview Terrace, Highgate, being splendid examples of cultural skill; Mr. J. M. Dixon, Fitzroy Park, was second; and Mr. Saunders, third.

Among the miscellaneous exhibits, Messrs. B. S. Williams and Sons, Upper Holloway, staged a pretty and interesting group of plants. Mr. W. P. Bodkin, J.P., West Hill, Highgate, sent a fine sample of his extensive collection of cacti, which created considerable interest. Groups of plants came from Mr. W. Ravenhill, Hampstead, and Mr. John Russell, Richmond.

WOLVERHAMPTON FLORAL FETE, July 12, 13, and 14.

In cool but pleasant weather Wolverhampton celebrated its tenth annual floral fête. There were cloudy skies but no rain fell, and towards the middle of the afternoon the sun broke through and lit up the greensward, tree, and shrub of the fine West Park with radiant beauty. Mr. Webster, the superintendent of the park, has this season used the viola with great effect in his bedding arrangements, and at every point the eye is attracted by patches and lines of various colours, all of which are highly effective. As is usual, there were six large tents arranged in line, and so great was the number of exhibits that but very few vacant spaces could be noticed.

Specimen Stove and Greenhouse Plants always occupy a prominent place, and Mr. James Cypher, Cheltenham, had an easy win with sixteen examples, of which not less than one-half had to be in flower. He had as a background huge specimens of Latania borbonica, Kentias Forsteriana and Belmoreana, two grand crotons, Phænocoma prolifera Barnesi, Ixora salicifolia, Allamanda nobilis, Bouganvillea glabra, Statice profusa, &c., a well-balanced lot. Mr. W. Finch, Coventry, was second, having large specimen foliage and very good flowering plants. Mr. W. Vause, Leamington, was third. Mr. Cypher was first with six fine palms, having kentias Thrinax elegans, Phœnix rupicola, and Latania borbonica; Mr. G. H. Kendrick, Birmingham, was second. With six plants in flower, Mr. Cypher was triumphant, having a fine Erica ventricosa Bothwelleana, Ixora Williamsi, Allamandra nobilis, Statice profusa, &c.; Mr. Finch came second, and Mr. Vause third.

In the gentlemen's garden division, the best six stove and greenhouse plants came from Mr. H. Tewkes, gardener to T. Clayton, Esq., but as it is not the practice at Wolverhampton to fill in the addresses of exhibitors, we cannot give them. Mr. A. Cryer, gardener to G. H. Kendrick, Esq., Birmingham, was second. With six exotic ferns, represented by well-grown samples, Mr. Tewkes was first, and Mr. R. Sharpe second. Some good specimen caladiums were shown, and there were numerous plants of tuberous begonias.

Orchids.—The only exhibitor of eight exotic orchids was Mr. J. Cypher; the specimens nicely staged with a ground-work of ferns. There were fine examples of Cattleyas Gaskelliana and Mossiæ, Lælia purpurata, Sobralia macrantha, Oncidium macranthum, &c.

Groups arranged for effect, shown in several classes, were so numerous as to fill the greater portions of two tents. It was said of Mr. Cypher's group of four hundred and fifty feet that it was the best he had ever staged, and it was clearly in advance of anything else. It was in the form of a square, but broken up by the method now followed—every portion a rare object lesson in artistic manipulation. Mr. J. E. Knight, Willenhall, was second, and Mr. Vause third. Both these arranged upon the same general lines as Mr. Cypher's. In the class for the gardeners' large group of three hundred and fifty feet, Mr. Cryer was first with an elaborate arrangement, which represented high artistic work, and Mr. R. Sharpe, gardener to H. Lovatt, Esq., was second.

Cut Flowers.—Good and varied as are the cut flowers shown at Wolverhampton, the roses form the leading attraction, and they occupied a considerable space of tabling. The best seventy-two came from Mr. B. R. Cant, Colchester. Even, fresh, bright, and well-arranged, a few of the leading blooms were Gustave Piganeau, Madame de Watteville, Auguste Rigotard, Prince Arthur, Charles Lefebvre, Mrs. Paul, La Fraicheur, Ernest Metz, Mrs. W. J. Grant, Countess of Caledon, General Jacqueminot, Golden Gate, Catherine Mermet, Helen Keller, Mrs. James Cocker, Alfred Colomb, Caroline Testout, Dr. Andry, Souvenir de S. A. Prince, &c. Messrs. Harkness and Son, Bedale, were second; and Mr. Frank Cant, third. Messrs. Harkness and Son were first with forty-eight blooms, chief among them being Caroline Kuster, White Lady, Mrs. J. Laing, Duke of Wellington, Madame Cusin, Niphetos, La France, Ernest Metz, The Bride, Margaret Dickson, Comtesse de Ludre, Souvenir de Elise, The Bride, &c.; second, Mr. F. Cant; third, Mr. B. R. Cant. The best eight varieties three trusses of each came from Mr. B R. Cant, particularly good were Mrs. J. Laing, Ulrich Brunner, Marchioness of Londonderry, and Helen Keller. Messrs. Harkness and Son were second, having in fine character General Jacqueminot, Madame Cusin, and Mrs. J. Laing; Mr. F. Cant was third. Messrs. J. Townsend and Son, Coventry, had the best twenty-four varieties; Mr. J. Mattock, Oxford, was second; and Mr. H. Merryweather, Southwell, third. The best twelve new varieties of the last three years came from Mr. F. Cant, who had in capital condition Helen Keller, Ellen Drew, Countess of Caledon, Ethel Richardson, Lawrence Allen, of a charming soft colour, and Muriel Grahame. Messrs. A. Dickson and Sons, Newtonards, County Down, were second; they had Countess of Caledon, Muriel Grahame, Mrs. W. J. Grant, and Souvenir de President Carnot; Mr. B. R. Cant, third. Messrs. J. Townsend and Son had the best twelve blooms of a dark rose, staging Gustave Piganeau; Mr. F. Cant was second with Horace Vernet; and Mr. B. R. Cant third, with Ulrich Brunner. The latter had the best twelve of any light rose, staging very fine Mrs. J. Laing; Messrs. A. Dickson and Sons came second with Bessie Brown, a very promising ivory-white variety; and Messrs. Townsend and Son third, with Marchioness of Londonderry. The best twelve teas came from Mr. J. Mattock.

An artistic arrangement in roses, covering a table space of sixty feet, proved a very interesting feature, the best coming from Messrs. Perkins and Sons, Coventry. Bouquets, stands of bloom, posies, &c., of charming roses in considerable variety, and of good quality, were prominent, and in the back ground a disc of Lord Penzance's sweet briars; Mr. J. Mattock was second; and Messrs. W. F. Gunn and Co., Birmingham, third. Several rose classes were set apart for gentlemen's gardeners and amateurs, the Rev. J. H. Pemberton, Havering, taking the leading prizes, he, as is usual, staging very fine blooms.

Boxes of twelve bunches of stove and greenhouse cut flowers were a fine feature, and here Mr. J. Cypher was placed first with a superb exhibit, staging large bunches of various orchids, cattleyas, odontoglossum, lælia, and masdevallia, gloriosa superba, ixoras, &c. There were several classes for bouquets, sprays, &c, the leading prize-takers being Messrs. Perkins and Son and M. Jenkinson and Co. Some arrangements in hardy border flowers were a good feature, Messrs. W. F. Gunn and Co. taking the first prize. There was also an arrangement in sweet peas for effect, and the awarding of the prizes showed great diversity of opinion among the judges. Eventually Messrs. W. F. Gunn and Co. were placed first; Mr. W. Goodacre, Elvaston, second; and Messrs. Jones Bros. third.

Fruit was in good character; the best collection of nine dishes came from Mr. J. H. Goodacre, Elvaston Castle Gardens, and consisted of Black Hamburgh and Muscat of Alexandria grapes, the former finely finished. Very fine Noblesse and Bellegrede peaches, Lord Napier nectarine, Lady Sudeley apple, Perfect melon, and strawberries; Mr. T. Bannerman, gardener to Lord Bagot, was a good second. Mr. Goodacre had the best four bunches of grapes, staging Gros Maroc, Black Hamburgh, Muscat Hamburgh, and Madresfield Court, all finely finished; Mr. J. Read, gardener to Lord Carnarvon, was second—he had Black Hamburgh, Madresfield Court, Buckland Sweetwater, and Muscat of Alexandria. The best two bunches of white grapes were Muscat of Alexandria from Mr. T. Jordan, Impney Hall; Mr. Bremmett, gardener to H. H. F. Mayhurst, Esq., was second with the same. Mr. Goodacre came in first with two bunches of black, staging superb Black Hamburgh; Mr. Barnes, Eaton Hall Gardens, was second with Black Hamburgh. Mr. Bannerman was first with a splendid dish of Royal George peaches; Mr. Wilkes was second with the same. Mr. Barnes came in first with a finely finished dish of Elruge's nectarines; Mr. Jordan second with Pitmaston Orange.

Messrs. Dickson, Limited, Chester, won the Hawley silver challenge cup for a display of plants and floral arrangements of a highly elaborate character; Mr. J. H. White, Worcester, was second. Certainly Wolverhampton maintains its high character, and the executive deserve high praise for excellent arrangements.

A RECORD OF PROGRESS.

It is of much interest, as affording an illustration of the stimulus given within recent years to commercial enterprises that have come to the front, owing to the increased interest in horticultural pursuits, and the consequent demand for gardening appliances, to refer to the development of the firm of Messrs. C. P. Kinnell and Co., of Southwark, who, from premises of restricted area upon the river front at Bankside, have extended their warehouses, until the extensive range of buildings in Southwark Street is rendered absolutely necessary for carrying on the immense business they have succeeded in building up. How much of the success of this firm is due to the business capacity and alertness of the founder and head of the firm, Mr. C. P. Kinnell, it would be difficult to estimate, for, from the day of small things until now, he has bent every faculty to the development of the firm; but, subsequently the direction was strengthened by the addition of other partners —Mr. John Kinnell, Mr. W. J. Tricker, and Mr. B. Daniel—each of whom had previously occupied positions of trust, and who have since fully justified the principal's choice. Consequently there is every prospect of the future prosperity fully exceeding the progress of the past, remarkable as this has been. The special introductions of the firm have included their famous "Rochford" boilers, for heating extensive ranges of hothouses and conservatories of large areas, the adaptability of which has long been fully assured; the no less successful "Silver Medal Horse-Shoe" boiler for amateurs' houses; as well as numerous ingenious contrivances indispensable in hot-water apparatus, either for perfecting water-pipe connections, or for fixing. There is quite a variety of patented appliances, as, for instance, their "New Pattern Diaphram Valve," an invaluable improvement. This possesses an arrangement which is at once effective and simple. An indiarubber ring of special quality is introduced upon the disc of the valve, which, brought into close contact with the gun-metal seating, makes a perfect joint, and therefore completely water tight. This is but one amongst a whole catalogue of appliances and conservatory fittings. We are informed that, amongst other new things Messrs. Kinnell anticipate bringing out in the near future, is a ventilating apparatus of novel design that has the promise of arousing considerable interest, and of coming largely into use.

Blanching Plants.—To the discovery of the process of blanching certain vegetables do we owe the possession of much valuable food. We find celery, but astringent, and quite unfit for food as a salad or stewed in an unblanched condition. Ordinarily to exclude light from plants is to exclude the most important element to health and strength. But whilst celery in the process of blanching is not materially weakened, having still ample leafage exposed to enable the plant to perform its various functions, yet the chlorophyll in the leaves does not penetrate to the earthed-up stems because light and air, the potent force in the production of colour, are absent. Physiologically blanching is an unhealthy, weakening, and improper process as applied to plants. Practically it is productive to consumers of plants for food of the best results. Matter that was in a state of rude health obnoxious, is by blanching converted into delicious food, we change worthless seakale into a most delightful and useful vegetable by its aid, so we do lettuce, and [illegible], and endive, and leekes and cardoons, and various other things. Doubtless originally discovered through some accident, blanching is now one of the most [illegible] elements in garden practice.—A. D.

ANSWERS TO CORRESPONDENTS

Editorial communications should be addressed to the Editor of the Gardeners' Magazine, 148 and 149, Aldersgate Street, E.C.

The Editor will be glad to receive photographs of gardens, plants, flowers, trees, fruits, &c., for reproduction in the Gardeners' Magazine. He will also be greatly obliged by correspondents sending early intimation of interesting local events relating to horticulture. In sending newspapers containing matter to which they wish to draw attention, correspondents are requested to distinctly mark the paragraph.

Specimens of plants, flowers, and fruits for naming or opinion should be sent to the Editor of the Gardeners' Magazine, "Endsleigh," Priory Park, Kew, Surrey, and as early in the week as possible. All parcels must be sufficiently prepaid.

Secretaries of horticultural societies are invited to send early notification of forthcoming exhibitions and meetings, and are requested to advise us concerning change of dates

Vegetable Cultivation.—G. F. Walsall: No book of the kind to which you refer has yet been published. We have, however, reason to believe that the articles you allude to will be published in book form.

Blind Broccoli.—J. R., Leeds: We can add nothing to our previous reply, as the specimens throw no further light upon the matter. In future pay careful attention to the seed-bed and the young seedlings, and in the first place obtain seed from a firm that has a high reputation to maintain.

Chrysanthemum Leaves.—J. S., Slough: The box of leaves you refer to must have miscarried. Send us another set to the Kew address, as above, and also as full particulars as possible. Send at once, so that the matter may be dealt with in the next issue.

Double Pelargoniums.—M. L., Northampton: So far as we are aware there is no double form of the variety you mention; you might endeavour to fix the sport and raise stock if you think the variety is worthy of perpetuation. With respect to the rosebuds dropping, there must be some purely local cause with which we are not acquainted. Excessive drought at the roots would be more likely to cause the buds to shrivel than to fall.

Long-handled Shears.—H., Sussex: We have only seen long-handled, or edging, shears used in one way, viz., by holding the straight handle in the left hand and the inclined one in the right hand, and walking towards the work; that is, towards the left. The set of the blades favours this method, but if a man can use the shears "left-handed," as you term it, there is no reason why he should not be allowed to do so, provided he does the work properly.

Failure with Tomatos.—H. W., Pickering: We do not understand how it is your tomatos have failed to set their fruits, unless it be that the house was kept very moist during the time of flowering. We take it for granted that the plants are not diseased in any way. The soil, according to the sample sent, is very poor and too light for tomatos to do thoroughly well in. Obtain new material, and start afresh with sturdy plants of some such prolific variety as Polegate, Duke of York, Chemin Rouge, &c. After the first truss has set and the fruits are swelling nicely give occasional supplies of liquid farmyard manure. We should have been better able to answer your question had we more information respecting variety, position, how planted, and any other particulars likely to affect the plants.

Liquid Manures.—W. T., Bradford: Houseslops vary so much in strength that considerable care is needed in their use as liquid manure. In the usual way the liquid will require to be diluted with three or four times its bulk of pure water. The best plan is to collect the urine into an underground tank until stale or commencing to putrify, as then it is most valuable. For use in houses this is a most objectionable liquid manure on account of its obnoxious odour. The sulphate of iron is of little or no use to you; a little may be given if the plants have extremely pale leaves, but not if they are healthy. Liquid farmyard manure is the best for general use; guano dissolved in soft water is also a fine stimulant, but must not be used strong—enough to just colour the water will suffice for most plants.

American Blight on Apple Trees.—F. M. E., Taunton: The specimen sent is badly infested with American Blight or Wooly Aphis (*Schizoneura lanigera*). This is one of the most troublesome pests of the apple tree, one that does serious injury if allowed to establish itself, and at the same time one of the worst to eradicate. American blight is rendered conspicuous by the white woolly growth on the insects, which gives a colony the appearance of a tuft of cotton wool. A lodgment is usually effected in the crevices of the bark, but the pest does not confine itself to these, for when a tree is much infested it spreads over the whole of the branches, and may be found clustering round the buds on the growth of the current season. As the result of an attack of American blight a diseased growth is produced, which affords shelter, and at the same time enables the insects to more readily obtain food. At the present time it is not an easy matter to apply insecticides of sufficient strength to kill the pest without doing some injury to the tree, but separate colonies can be easily destroyed by brushing them over with a rather strong solution of some good insecticide. An emulsion formed with soft soap and paraffin judiciously applied will speedily dislodge them. Spraying the trees during the season of growth with the emulsion sufficiently reduced in strength that it will not injure the leaves will be useful in checking the pest. The chief attack on American blight should be made during the winter, when the whole of the stem and branches should be washed with hot brine, and be dressed with a suitable preparation, care being taken to work it well into the crevices in the bark and the junctions of the branches. The preparation used as a winter dressing may, of course, be much stronger than for summer spraying, but care must be taken not to employ it of too great a strength. The following wash will be useful: Four ounces of hard soap is put into one quart of water, and this is heated until the soap is dissolved. One pint of paraffin oil is added, and the whole agitated until a permanent mixture or emulsion is formed. Water is then added in sufficient quantities for the paraffin to be in the proportion of one to fifteen. A mixture consisting of a quarter of a peck of unslaked lime, four ounces of sulphur, and two ounces of lamp black is also an excellent remedy for the pest.

Blistered Peach Leaves.—W. G., Maidstone: The leaves sent are as badly blistered as any we have ever seen, and we feel sure that the attack is due to a very bad state of affairs at the roots of the trees. No doubt the subsoil is very cold and wet, so that growth is late, and does not ripen properly in the autumn. Then, probably, the position of the trees is such that cold winds reach the leaves when young and tender, sufficient in itself to cause blister, especially when accompanied by a dull, wet spring, such as we have experienced. Pick off the damaged leaves, or at any rate the worst of them, and keep those remaining clear of green fly or other insect attack. To assist the trees give them a light top dressing with bone meal, lightly forking this in and leaving the surface loose and unmulched. In the autumn, as soon as the leaves turn yellow, lift the trees and place them so that the roots are near the surface; drain the borders if this appears necessary, and mix plenty of lime rubble with the soil that is placed about the roots. It will scarcely be necessary or prudent to stop the growths this season, but the subsequent behaviour of the trees must guide you in this matter.

Names of Plants.—Under this heading we can only undertake to name species and specific varieties of plants, and not florists' flowers. Specimens should be packed in stout boxes with damp moss or leaves as packing material to ensure their reaching us in a fresh state. It is essential that flowers must accompany specimens of flowering plants, that fern fronds be fertile, and that the numbers be legible and firmly attached to the specimens. We cannot promise to name more than six specimens at one time from any one correspondent.

G. S., Guildford: 1, insufficient for identification; 2, Retinospora plumosa; the other specimen is Monarda didyma. When sending conifers for naming a characteristic specimen of good size should be sent, and, if possible, a piece carrying cones.

G. F., Walsall: 1, Eupatorium riparium; 2, Eulalia zebrina; 3, Anthericum variegatum; 4, Cyperus alternifolius; 5, specimen missing; 6, Vinca minor variegata.

G. R., Wellingborough: 1, Lilium Thunbergianum; 2, Campanula persicifolia; 3, a garden variety of Iris xiphium; 4, not recognised; 5, a seedling scabious.

A. A., Angmering: 1, Vanda teres; 2, Epidendrum variegatum; 3, Maxillaria tenuifolia; 4, Aerides odoratum; 5, Adiantum peruvianum; 6, Gymnogramme japonica variegata.

PROPOSED STATE FOREST FOR SCOTLAND.

THE strong appeal addressed to the Minister for Agriculture by the Royal Arboricultural Society, will (writes a Scottish correspondent) command general sympathy, and the object in view will be recognised as one highly important in itself, and eminently practical in its character. It is of a two-fold character. What is aimed at is to provide the means for efficient instruction in the science and art of forestry for foresters, land agents, and others, and to supply to Scottish landowners, and more especially those who have waste or mountain land in their possession, a stimulus to improvement in the way of afforestation. There are already classes in Edinburgh in connection with the University of the Royal Botanic Gardens, and the Heriot-Watt College, at which instruction in forestry is given, and what is desired is that the Government should supply funds—it is thought that £40,000 would be sufficient—for the acquisition of some 1,500 or 2,000 acres of land within easy reach of Edinburgh, more or less under wood, for the purpose of a forest, in connection with which instruction in the practical side of their business would be afforded to students, and work of an experimental character carried on. The proposal is a very modest one, so modest that there ought to be no great difficulty in obtaining the necessary funds even from private sources if the Government do not see their way to supply them. In view of the importance of the matter to the proprietors of land in Scotland, it were not too much, one would think, to expect that they would come forward and supply what is needed in the way of funds. But here we at once come upon what forms the great difficulty of the situation. If our proprietors as a class were alive to their interests, not to speak of their duty, in this matter of forestry, it would not be necessary at this time of day for any such body as the Royal Scottish Arboricultural Society to be pleading for some practical attention to the science of forestry, as developed and cultivated in France, Germany, and other countries, including our own Dependency of India. The average proprietor of land in Scotland shows no practical interest in what ought to be one of the things in which he mainly concerned himself. He is too impecunious to do much, if anything, in the way of planting, seeing that there is no immediate return to be looked for. In the Highlands and adjoining regions again, where there is so much scope for the afforestation of the land, sport is the all-absorbing subject of interest, and the ready-money rent paid by the tenant of the grouse moor or deer forest is so much more tempting than the postponed returns from the woods which take a lifetime or more to be worth cutting down. Thus it is that the landowners of Scotland neglect what ought to be a main part of their business—the cultivation of trees and the production of timber. And of course, neglecting it as they do, they are not likely to come to the assistance of the Royal Arboricultural Society in its appeal for money to establish a model forest. As to the location of the proposed forest, it is natural that the society should think of the neighbourhood of Edinburgh, but a more advantageous arrangement as regards practical results would seem to be to have it established in some suitable part of the Highlands. It is in the Highlands of Scotland that anything of consequence in the way of the afforestation of the waste lands of Scotland can alone be effected, just as it is in the Highlands that any considerable forests are already in existence. It is in the Highlands therefore, that the climatic and other conditions exist which it is most important for those interested in sylviculture to understand, and where any experiments in the growing of trees, the management of woods, and in the production of timber can be most advantageously carried out. Some locality, say near the base of the Eastern Grampians, would therefore seem to be a more suitable site for the proposed model forest than the rich Lothians. In their statement the R.A.S. acknowledge that Scotch grown timber is as a rule greatly inferior to that imported from Norway and elsewhere. This is a circumstance which it would be folly not to take into account in anything that may be undertaken for the development of forestry in Scotland. The timber of the ordinary Scots fir is a poor article compared with the pine woods from the Baltic and North America, and the question is if it can be so improved in quality by improved conditions of growth as to be capable of being brought into competition as an article of commerce with the foreign product. But as it is known at present, with but little skill or attention bestowed upon them, woods can be made to yield a revenue, acre for acre, hardly less than that obtained from ordinary farming land, there ought to be and no doubt is, ample scope in Scotland for the profitable development of sylviculture as a national industry.

MARKETS.

Covent Garden.

NOTWITHSTANDING the large supplies of fruit and vegetables a clearance is generally readily effected at fair prices, owing to the steady demand. Strawberries are rather dear, but cherries are fairly plentiful. Grapes and tomatos are cheap.

FRUIT.—English grapes, 1s. 3d. to 2s.; Belgium, 9d; Jersey, 10d. to 1s. 6d. per lb.; strawberries, 2s. 6d. to 4s. per peck; 1s. to 1s. 9d. per handle basket; cherries, 3s. 6d. to 8s 6d per half-sieve; lemons, 6s. to 16s. per case; English tomatos, 4d. to 6d.; Jersey, 3d, to 4d. per lb.; Spanish, 1s. to 1s. 4d. per box; gooseberries, 2s. 9d to 4s. per bushel; green figs, 2s. 6d. to 3s. 6d. per dozen; French apricots, 5s. to 7s. per dozen boxes; French peaches, 1s. to 2s. per box; English, 2s. to 8s. per dozen; Tasmanian apples, 8s. to 15s. per case; pineapples, 2s. 6d. to 4s. 6d. each; bananas, 5s. to 9s. per bunch; French greengages, 1s. to 1s. 6d. per box; oranges, 15s. to 20s. per case.

FLOWERS.—Arums, 3s. to 4s.; carnations, 1s. to 3s.; eucharis, 3s. to 4s.; gardenias, 1s. to 3s.; Lilium Harrisi, 3s. to 4s.; tea roses, 6d. to 1s.; pink roses, 2s. to 5s.; red roses, 1s. to 4s.; cattleyas, 6s. to 9s.; Odontoglossum crispum, 1s. 6d. to 4s.; and tuberoses, 1s. to 1s. 6d. per dozen blooms; Adiantum cuneatum, 4s. to 8s.; marguerites, 2s. to 4s.; mignonette, 2s. to 4s.; pelargoniums (scarlet), 4s. to 6s.; stephanotis, 1s. 6d. to 2s.; lily of the valley, 6d. to 1s.; white gladiolas, 6d. to 9d; and pelargoniums, 4d. to 6d. per dozen sprays.

VEGETABLES.—Endive, 1s. to 1s. 3d; cucumbers, 1s. 6d. to 3s.; cauliflowers, 1s to 2s. per dozen; broad beans, 2s. to 2s. 6d. per bushel; marrows, 3s to 3s. 6d. per dozen; peas, 2s. to 4s. per bushel, 2s 6d. to 4s. 6d. per bag; French beans, 3d. per lb.; parsley, 1s. to 1s. 6d.; mint, 2s. to 2s. 6d.; carrots, 3s. to 4s.; turnips, 3s to 4s. per dozen bunches; lettuce, 8d to 10d. per score; cos, 1s. 3d to 1s. 6d. per dozen; mushrooms, 5s. to 8s.; eschallots, 1s. 6d. to 2s. 6d. per 12 lbs.; English onions, 1s. 6d. to 2s. 6d. per dozen bunches; Egyptian, 4s. 6d. to 5s. 6d. per bag; spinach, 1s. 6d. to 2s. per bushel; Jersey potatos, 6s. to 6s. 6d; St. Malo, 5s. to 5s. 6d.; Kent, 6s. to 7s. per cwt.

Borough Potato Market.

Heavy supplies continue to arrive, but trade is good without any appreciable alteration in prices. English kidneys and White Beauties, 5s, to 5s. 6d.; St. Malo, 4s. 6d. to 5s.; Jersey Flukes, 5s.; kidneys, 4s. 6d.; Cherbourg Flukes, 4s. 6d.; kidneys, 4s.

The mean reading of the Barometer during the week at Greenwich was 30·03 inches, and that of the Thermometer 60°·0, the latter being 2°·0 below the week's average in the 50 years 1841—90. The direction of the wind was variable, the horizontal movement of the air being 5 per cent. above the week's average in the 16 years 1860—75. The duration of registered bright sunshine in the week was 40·4 hours. No rain was measured during the week.

PRACTICAL LANDSCAPE GARDENING and ESTATE DEVELOPMENT CO.

This Company undertakes to advise as to the laying out of gardens, the general improvement of landed property, and the development of building estates; to provide plans and estimates, and, for a fixed sum, to carry out all work incidental to the making of the smallest Villa garden as well as to the designing and execution of the most extended estate improvements.

It has a staff of experienced foremen, and all necessary plant.

No charge whatever is made for plans, which, however, remain the property of the Company unless the work is carried out by it.

All communications to be addressed to—

ESTATE DEVELOPMENT CO.,

RUSTIC ADORNMENTS

FOR

HOMES OF TASTE,

BY THE LATE SHIRLEY HIBBERD.

New and Revised Edition by the Editor of AMATEUR GARDENING.

"This new and revised edition maintains its position as something more than an ordinary amateur's guide; it is a practical work brought up to date so as to keep abreast of fashion and taste as displayed in the floral decorations of the table, the home, and the garden. This work would make a useful present to anyone."—*The Bazaar, the Exchange and Mart.*

"We cannot imagine a more appropriate presentation book than this to persons who delight in flower and attractive home surroundings. It is worthy a place in any 'home of taste.' It abounds in useful practical hints, and is eminently readable from end to end."—*Journal of Horticulture.*

W. H. and L. COLLINGRIDGE, Aldersgate Street, London.

Situations Wanted.

Advertisements under this heading are charged 1s. each, four lines (32 words), and 3d. per line after. A Copy of the "Gardeners' Magazine," Post Free, 2½d.

HARLOW STATION, G.E.R.

WEST'S PATENT
IVORINE PLANT LABELS

THE "IVORINE" WRITING DISC, being made of a Celluloid and Xylonite composition, is imperishable, and does not corrode or eat away, like wood and metal labels; and being ivory-white, when written upon it shows to perfection. And also, as the writing is on the Ivorine itself it is permanent, though washable, and does not become unreadable like all other labels, for hitherto all labels have been painted, as the paint gets old. It is for labelling every description of goods when used with or without the wires, and will last a century, either in a greenhouse, in a wine cellar, or out in a garden, and not only is it always ready for use, and may be written on both sides, but the name when written in pencil may be easily rubbed off, and so used as many times as desired.

Samples and Lists of the West's Patent Specialities post free. Price, **9d.** per dozen; **8s.** per gross, complete; **7s.** per gross without wires, Carriage Paid. Size a little larger than illustration, and wires 2 ins. longer from loop. (See List for other sizes). Special ink, if required, in **6d.** bottles, per post.

Supplied by all Nurserymen, Florists, &c.

The LEEDS ORCHID Co.,

ROUNDHAY, LEEDS.

THE ROYAL NURSERIES,

MAIDSTONE, KENT.

GEORGE BUNYARD & CO.

Are now BOOKING ORDERS for Early Delivery of the very best NEW and OLD

STRAWBERRIES

For Crop 1899, or for Forcing.

They offer the Largest Stock and the Best Plants in the trade.

CHANGE OF STOCK PAYS.

CATALOGUES OF STRAWBERRIES AND SUMMER FRUITS NOW READY.

IMPORTANT TO GARDENERS.

NIQUAS

(Registered).

The most successful Insecticide of the day.

ITS ADVANTAGES ARE:—

Certain death to all Insect Pests.

No possible Injury to the most delicate plants, flowers, or foliage.

It is the cheapest in the market. One pint makes 10 to 15 gallons.

DIRECTIONS WITH EACH TIN AND KEG.

PRICE:—Quart, **1s. 6d.**; Half-gallon, **2s. 6d.**; Gallon, **4s. 3d**; 5 Gallons, **20s.**; 10 Gallons, **36s. 8d.**; 20 Gallons, **70s.**

From all Seedsmen and Florists.

SOLE WHOLESALE AGENTS:—

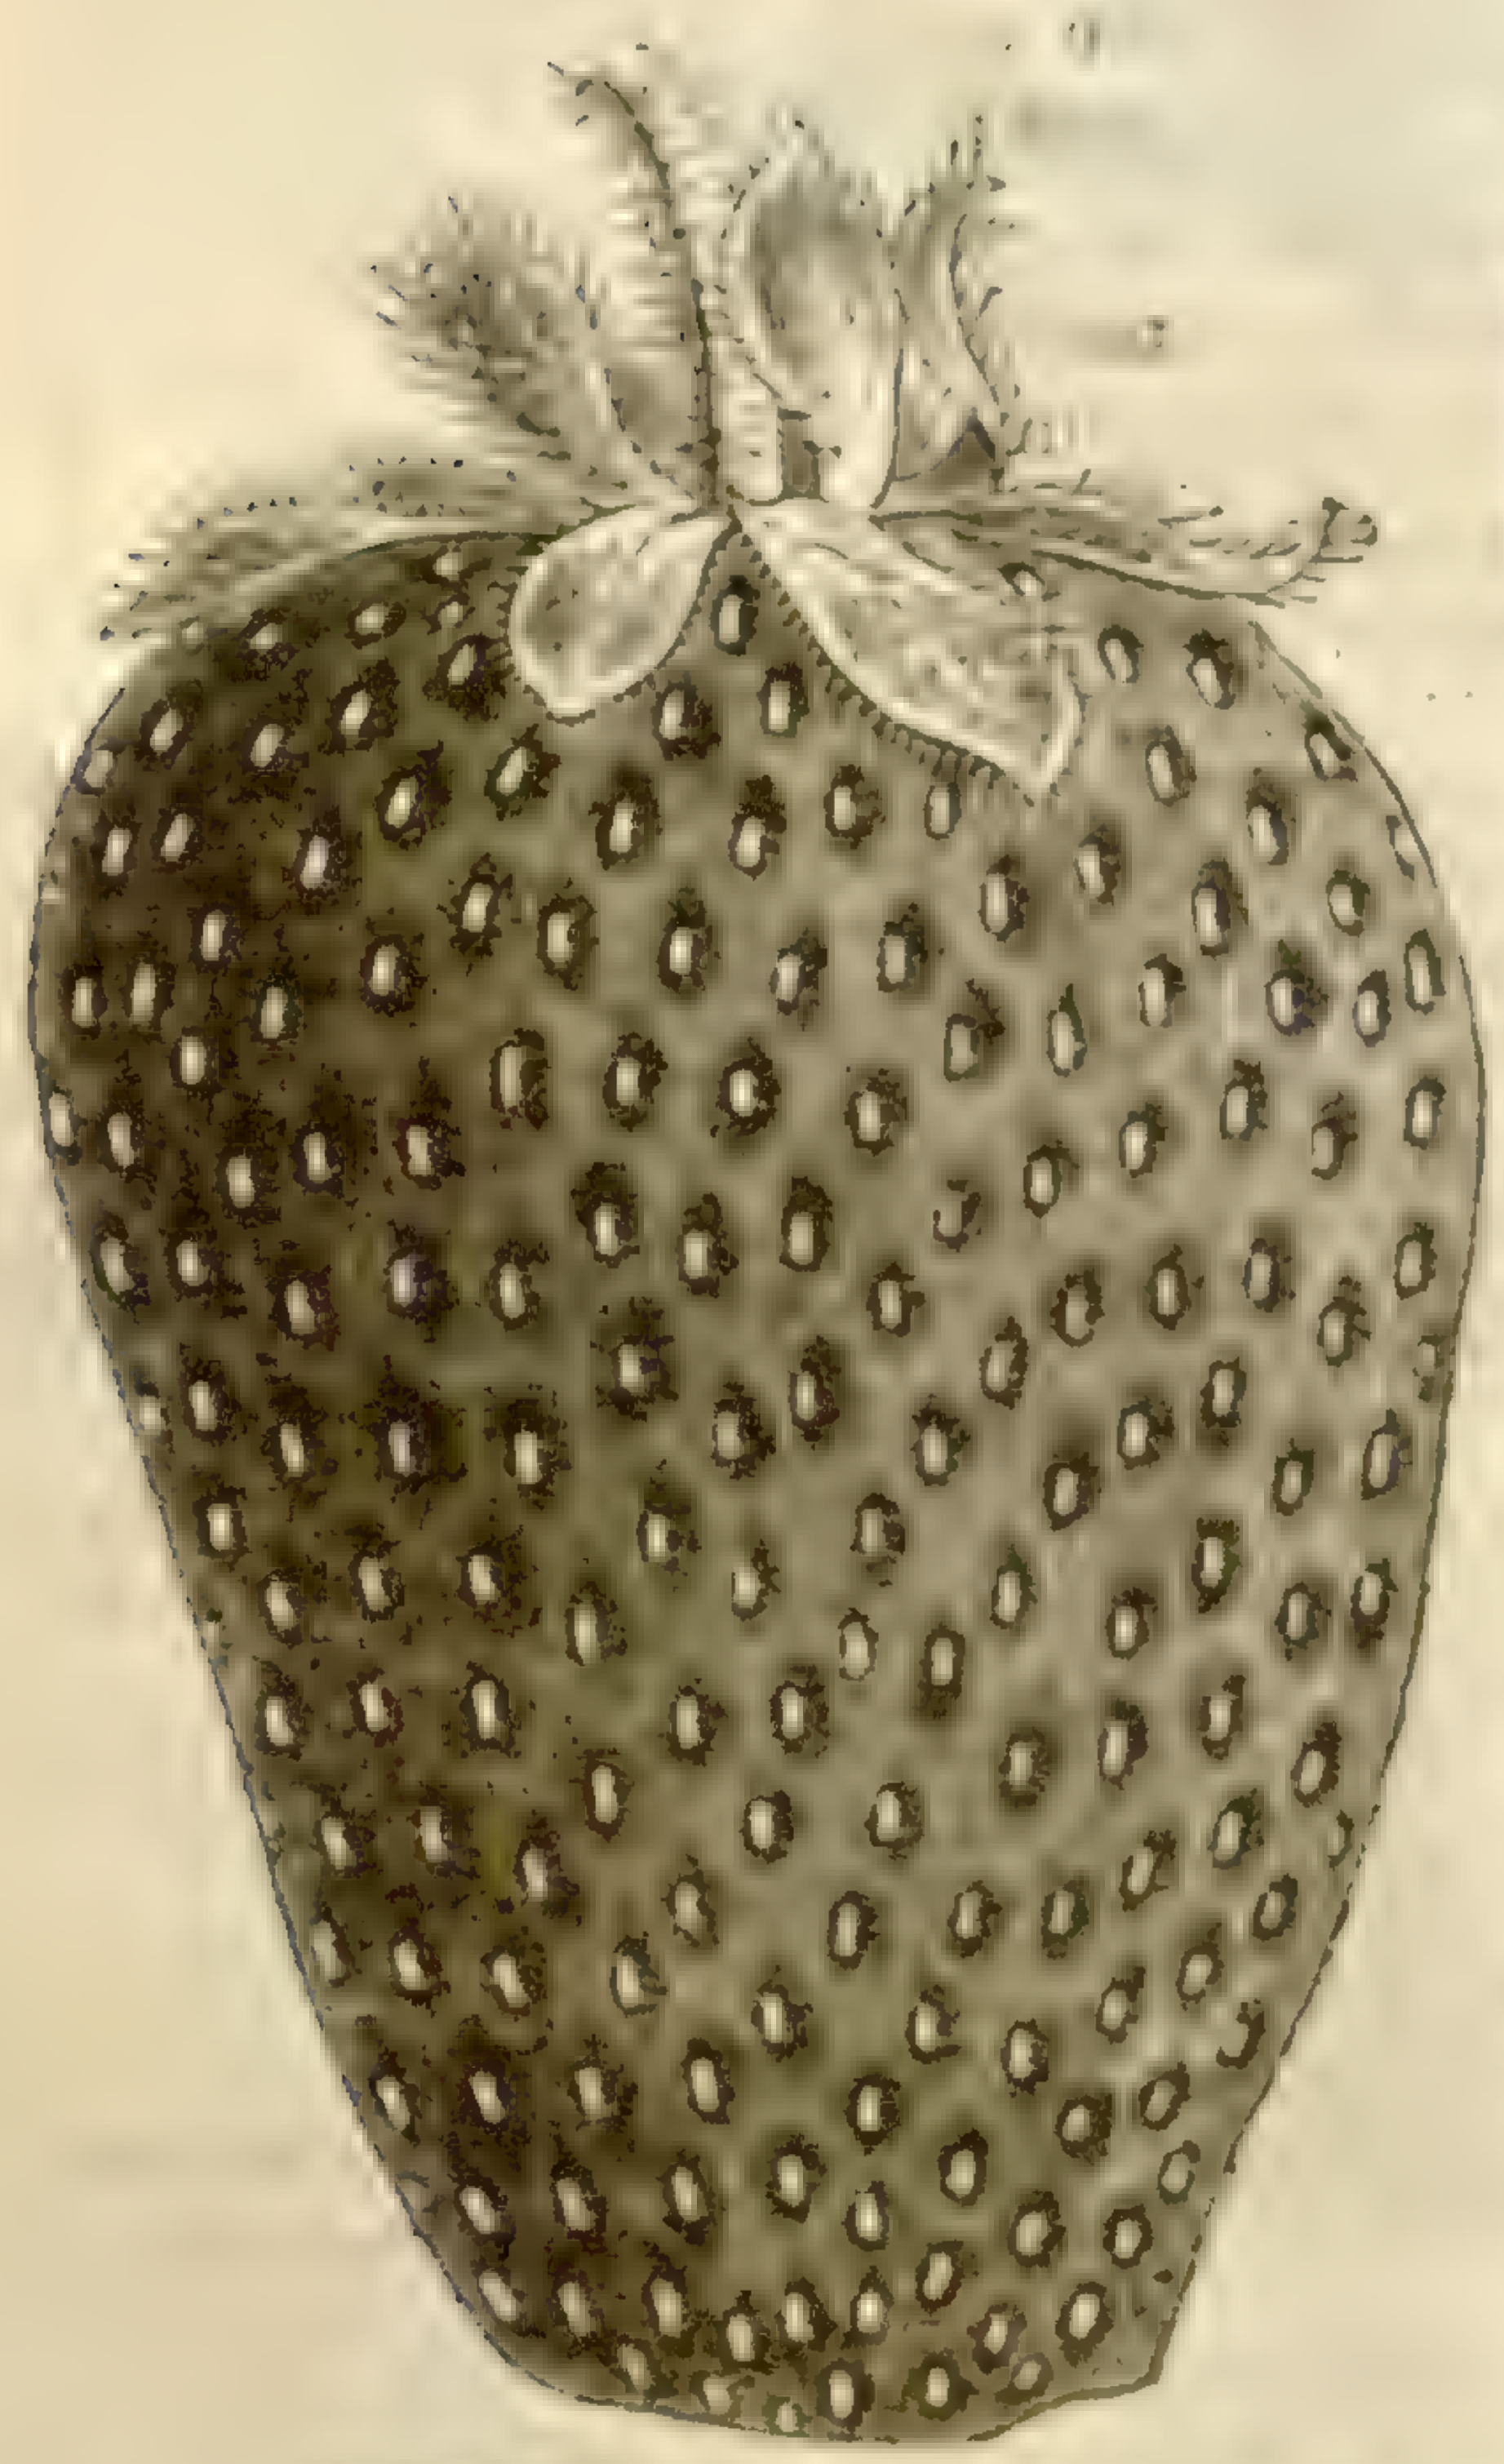
CORRY & CO., LIM.,

FINSBURY STREET,

LONDON, E.C.

LAXTONS' STRAWBERRIES

WE HAVE THE LARGEST AREA DEVOTED ENTIRELY TO RUNNER PLANTS (14 ACRES).



If you wish for the Best Varieties you must have—

LAXTON'S (GRAND NEW LATE) "FILLBASKET."

Raised from those two fine varieties, "Royal Sovereign" and "Latest of All."

It is the best of some hundreds of seedlings from the cross. The colour is a good bright scarlet, the flesh white and firm, in size it is between its two parents, the flavour is very rich yet juicy and luscious, and highly perfumed. **The cropping qualities are remarkable**, it carries more fruit spikes than foliage, the individual trusses with as many as ten fruits on each. The habit is compact and robust, leaves very thick and leathery; it ripens its fruit with "Latest of All," and we have confidence it will take and maintain its position amongst fruits as long as "Fillbasket" Pea has amongst vegetables—a really remarkable and valuable acquisition, and one we have great confidence in offering.

PRICE—Open Ground Runners, £3 per 100, 10/- doz.; in Pots, £4 per 100, 12/- per doz.

Also "LAXTONS' MENTMORE," Grand New '97.

In addition to the above you must have—

"LAXTONS' LEADER" and "LAXTONS' MONARCH."—Unequalled for size, colour, and flavour.

PRICE—Open Ground Runners, **5/-** per 100; in Pots, **15/-** per 100.

"ROYAL SOVEREIGN."—Still the Best Early Forcer. Open Ground Runners, **5/-** 100; in Pots, **15/-** 100.

All other varieties worth cultivating are included in our NEW CATALOGUE, fully illustrated, and with Cultural Hints.

A CHANGE OF STOCK IS HIGHLY ESSENTIAL.

WRITE FOR LISTS TO—

LAXTON BROTHERS, Seed and Novelty Growers, **BEDFORD.**

THE GARDENERS' MAGAZINE.

SATURDAY, JULY 23, 1898.

NOTICE TO ADVERTISERS.

Owing to continued increase in circulation, the "Gardeners' Magazine" now goes to press on Wednesday. No advertisement can be guaranteed insertion, or altered, unless received before Four p.m. on that day.

NOTES OF THE WEEK.

EXHIBITING ROSES.

WITH the magnificent display at Halifax on the 14th inst., the exhibition season of the National Rose Society for the current year was brought to a close, and notwithstanding the fact that the lateness of the season somewhat adversely affected the southern sh ow, there can be no question as to the season having been one of the most successful the society has yet had to record. The exhibitions, regarded as a whole, have in no previous year been more extensive, interesting, or attractive, while the average quality of the thousands of blooms staged has been eminently satisfactory. This year the two provincial exhibitions have been supplemented by conferences, which have so greatly enhanced their interest and educational value, as to justify the hope that the experiment of affording rosarians an opportunity of assembling in council will be repeated next year. At Bath the all important question of pruning was discussed, and as the result, we trust clearer views will obtain on the principle and practice of pruning roses. Not less satisfactory was the conference at Halifax, when Mr. George Paul opened a discussion on exhibiting roses, and the rosarians present had an opportunity of expressing their views on the tying and dressing of exhibition blooms and the staging of garden roses. Mr. Paul expressed himself as strongly opposed to the practice now so general of tying blooms for the purpose of keeping the centres together, and he based his opposition on the loss of colour resulting from the practice. It was, however, shown that there are two sides to this question, and Mr. A. Dickson, Mr. O. G. Orpen, and Mr. E. B. Lindsell stated it would be practically impossible to convey exhibition roses long distances without giving them the support a strand of cotton wool affords. Tying the blooms is a small matter as compared with subjecting them to the manipulation know as dressing, and with reference to the latter practice, we fully agree with Mr. Paul that "To transform a flower from its natural shape is a fraud, and distinctly injures the flower eventually in public esteem." In not a few instances the blooms are so manipulated as to deprive them of the exquisite form they naturally possess, and give them much the appearance of the cabbages and lettuces that figure in catalogues, with their outer leaves broken down to show their centres. There can be no great objection to the removal of a damaged petal or even to a slight arrangement of a petal here and there; but there is the gravest objection to the systematic dressing which finds favour with some exhibitors, and we are glad to say that not a word was said in its defence. The National Rose Society has steadily set its face against dressing, but it is difficult to impose an efficient check upon the practice. The present method of staging garden roses was defended by Mr. Paul, who appears to have missed the point at issue between those who regard a limit to the number of trusses in a bunch as desirable and those who consider that no such limit should be imposed. We, and those who hold the same views as ourselves, believe that the collections of garden roses would have higher educational value if the number of trusses were limited, as visitors would be able to see at a glance the relative size of the trusses of the varieties staged. Mr. Paul contends that "a bunch of, say, six or eight trusses of Polyantha Perle d'Or would be useless to show that sort," but from our point of view such a number would be ample, for the visitor would then have ocular demonstration of the fact that the variety produces trusses of small size. Mr. Machin was fully in accord with Mr. Paul, while Mr. Pemberton and Mr. Frank Cant expressed themselves in favour of a limit. The question is of considerable interest, and its discussion with [illegible] of the other points raised was so pleasant and useful as to leave an agreeable impression upon the audience.

THE POCKET LENS.

ALTHOUGH there is an immense amount of pleasure to be derived from a simple walk around a well-stocked garden, or, better still, through such a wonder-filled rockery dell as that at Kew, that inner world of marvellous beauty revealed in every flower and leaf by a simple little pocket lens is mainly enjoyed by the botanist. The outside loveliness of form and colour constituting the popular attractions of flowers bears much the same relation to this inner loveliness as does a broad and picturesque landscape to the myriad beauties of hill and dale, green lane, and secluded glen, &c., which nearer inspection reveals, and the tiniest flower we can pick, or a leaf plucked even from the nearest weed will, when brought into the focus of our little glass, expand in the one case into a tissue of marvellous structure, and in the other display to the delighted eye fully as much beauty of corolla, and petal, and stamens, and pollen as the stateliest blooms display to vision unaided. A little hairy, or woolly, or bristly leaf or stem is seen to be decked with thousands of neatly, and often complexly built-up outgrowths, as different from the ordinary notions of hairs as can possibly be, some being arranged even in star fashion, but in every case on some special and symmetrical plan which, in itself, is a wonder of contrivance. The stem, too, may be plain, or ridged, or fluted, or jointed, or varied in manifold and multiform ways, and cuts across by a sharp knife will display beautiful sections. In the flowers and leaves viewed generally, little or none of these special characters are seen, but under the little triple lens a transformation scene takes place, and even the smooth petal of the rose not only glows with added brilliancy of colour under its keen scrutiny, but the lovely cells which built it up display a texture our unaided eyes can never detect. The pollen alone is an endless study of variety from the comparatively huge, dark crimson grains of the lily tribe to the minute dust-like atoms which in the common stinging nettle may be seen to be puffed out from its exploding blossoms like mimic microscopic gun batteries. Not merely flowers, leaves, stems, and pollen, but the resulting seed and seed vessels are one and all things of beauty viewed through the lens. Every seed is built on a plan of its own. Some are smooth, some rugged, and many are very beautifully decorated. We see this in the larger seeds without the lens, and the same applies even to the smaller, for Nature laughs at size, and can put as much ornate decoration on a pin's point as the deftest artist could delineate on an acre of canvas. With the lens, too, the other marvels of the garden, its insect as well as its floral tenants, display a myriad wonders, and if led on, by the exhibition it affords, to try higher powers and aspire to a microscope proper, we shall find that the smallest are often the most beautiful, and that every step of magnification reveals more and more intricacy of charm and design in a thousand things which to the eye alone are mere moving dots devoid of interest altogether. This being so, it is really astonishing in these days of progressive knowledge, to find how few people, even ardent gardeners, carry or use a pocket lens, though in many cases, apart from its aid in detecting the underlying beauties of nature, a little practice in its use would often enable the cultivator to detect his insect and fungoid foes long before their presence is betrayed by the destruction they cause, and thus to be beforehand with his remedies.

ROOTS.

ROOTS, as a rule, are of such a modest, retiring nature that, as compared with the aerial growth of plants, the stem, branches and leaves, and it may be gorgeous flowers, they rarely receive the attention they merit as vital essentials. Their extremely diverse character, too, is largely hidden, although in a general way we know that they vary in size from huge woody masses over which we may stumble in the forest, down to tiny branches of threads in the cases of diminutive plants. In addition, however, to mere difference in dimensions, they also vary enormously in character; but here, probably, the popular notion goes beyond the mark since carrots, turnips, and fleshy growths of that kind are not really roots as usually considered, but mere stores of nourishment elaborated by the joint action of roots proper, and the leaves, the said roots proper, being those slender fibres proceeding from the carrots, turnips, or what not, near their lower terminations. Bulbs, too, such as lilies, tulips, &c., are not roots, but really gigantic buds, which produce roots in some way from their bases. The active portions of roots, indeed, are usually very much alike in all tribes of plants; these consist of threads of cellular growth, the tips of which penetrate the soil and spread in all directions, absorbing as they proceed the necessary salts and moisture required for the formative work going on above ground with the aid of materials derived from the air, and the vital force imparted by the light of the sun. Naturally as these primary rootlets proceed, branching as they go, the conduits to the upper air, which they also constitute, must be enlarged to accommodate the increasing contributions, hence thickening goes on as well as lengthening under the ground, precisely as it does in the network of branches and twigs above it. Doubtless very often were it possible to get out a huge tree intact with all its roots and rootlets, the difference in spread and ramifications between the upper and lower portions would be found to be very small. When, indeed, we regard a huge oak, elm, or other gigantic tree in full foliage, and consider that on a hot day every one of those millions of leaves is freely transpiring the water derived from the soil beneath, it becomes clear enough that an immense system of supply must be at work to replace the loss. There is probably, indeed, a direct ratio maintained between the transpiring surfaces and the feeding roots, since in thick, fleshy plants, such as cacti, sediums, &c., the tenants of dry soils and thirsty deserts, the roots are relatively scanty; and in the orchid tribe, where, on the other hand, constant moisture in the air checks transpiration, and thick pseudo bulbs and leathery leaves are the rule, we find the roots are thick and few, and mainly serve as attachments to the site of growth. Water weeds will grow without any roots to speak of, and afford another illustration of the rule. In watching the development of seeds, one of the most marvellous and striking things is the first differentiation of roots and leaves, the self same primary cell splitting up into two, one of which then manufactures a root which shuns the light and plunges into the soil, while the other does exactly the opposite, and shoots upward to greet the sun and form the leaves. Despite this difference of habit, however, the sympathetic action between the two is perfect; it is a true partnership on intelligent lines; each seeks an independent source of profit, and both work to the same end—the creation of a flower, the perfection of the seed, and through this the perpetuation of the race.

A Special Exhibition of Bamboos will be provided at the next meeting of the Royal Horticultural Society, to be held in the Drill Hall, St. James's Street, on Tuesday, July 26, by A. B. Freeman-Mitford, Esq., C,B., of Batsford Park, Moreton-in-the-Marsh, Gloucestershire. Mr. Freeman-Mitford has probably the finest existing collection of bamboos, and no one has a better knowledge of these elegant plants than he, consequently, a special opportunity for gaining information will be afforded on the date mentioned, for in addition to the exhibit there will be a lecture at three p.m. on the "Economic Uses of Bamboos," given by this accomplished gentleman.

Hampstead Heath Extension.—The Tree and Open Spaces Committee of the Hampstead Vestry recommend the vestry to contribute £10,000 to the Hampstead Heath Extension Fund for securing the Golder's Hill Estate, of over thirty-six acres, as an addition to Hampstead Heath. About £40,000 is required for the purpose, towards which about £12,000 has already been secured by private subscriptions. Should this charming estate after all fall into the builders' hands, one of the most beautiful landscape views in England, and one that is at present enjoyed by the many thousands visiting Hampstead Heath, would be absolutely spoilt. A garden party in aid of the extension scheme was held in the grounds of Golder's Hill on Thursday, the 21st inst.

The Berlin Sewage Farm.—The Berlin sewer system transports annually from 60,000,000 to 70,000,000 cubic metres of sewage for distribution over the broad acres lying seven to fifteen miles from the city. The area of the fields irrigated is more than 20,000 acres, or greater than the present area of the city, which is twenty-five miles. We understand that the total cost of the drainage system is about £5,208,333, and it is estimated that it will take £1,041,666 more to complete it. Yet, owing to the enormous yield of the irrigated land, it will soon return a revenue on first cost, and pay for the investment besides. As many as five crops of hay are cut in a single year, and several crops of vegetables are obtained each season.

Laxton's Trafalgar Strawberry is a new late variety, raised by the Messrs. Laxton Brothers, of Bedford, by crossing Waterloo with Elton Pine. A few fruits submitted for our inspection travelled remarkably well; they were large specimens, bluntly conical in shape, but with a very slight tendency towards the wedge-shape. In flavour the variety is rich, juicy, and sweet, with a pleasant touch of acidity that is most refreshing. The strawberries are of a handsome dark scarlet hue, and the flesh is light scarlet. Provided it is a good cropper—and the Laxton strawberries are good croppers—Trafalgar should have a great future as a late variety, for we are informed that it ripens several days later than Waterloo.

Our Best Dessert Apples.—The conditions under which the "Veitch Prizes for Flavour" have been competed for at the various meetings of the Royal Horticultural Society during the two years commencing July 14, 1896, and ending in June, 1898, are now well known to our readers. The aim was to form a definite list of the best flavoured apples and pears for dessert at all seasons; six fruits of a variety had to be shown, and no exhibitor was allowed to compete a second time in one year with a variety that had already gained him a first prize; neither could one person obtain more than one second prize with the same variety. The tabulated statement of results is published in the current issue of the R.H.S. *Journal*, and from it we find that Cox's Orange Pippin takes the lead among apples, having been the best on twelve occasions and second twice; it was not beaten during October, November, and December, 1896, and January, 1897, and it was to the front in October, 1897, the first meeting in December of that year, and again in February and March, 1898. On two occasions Cox's Orange was beaten, once by Ribston Pippin, September 30, 1897, and once by Cockle's Pippin on November 23, 1897. Ribston Pippin ranks next, for although only first once as noted above, it came second only to Cox's Orange Pippin on five occasions. Blenheim Pippin was first on February 9, 1897, and second only to Cox's Orange on December 15, 1896, and January 12, 1897. As an early apple Irish Peach was a success, coming first at one meeting in August, 1896, and one in August, 1897; Worcester Pearmain led the way on August 25, 1896, and was second on September 8, 1896. Cockle's Pippin was the best flavoured apple of March 9, and of November 23, 1897, and second best on November 9, and December 14 of the same year. Sturmer Pippin could not be beaten on April 27, 1897, and April 12, 1898, but was second on April 13, and June 15, 1897, and March 22, 1898. Allen's Everlasting secured first prize for flavour on two occasions, viz. March 23, 1897, and April 26, 1898; Adams' Pearmain, though only second at both the March meetings of 1897, was first in December, 1898; Lady Sudeley could only reach second place, and that on August 10 and 24, 1897. Court Pendu Plat was first on May 11, 1897, but could only reach second place on April 12, 1898; Herefordshire Pearmain was second on April 26, 1898, but rose to first place at the following meeting. Other varieties with which first prizes were gained for flavour are Benoni, September 8, 1896; Lord Burghley, April 13, 1897; French Crab, June 15, 1897; Kerry Pippin, September 7, 1897; Margil, January 11, 1898; and Lamb Abbey Pearmain, March 22, 1898. Apples that never reached higher than second place, and that only once during the two years, are Red Astrachan, Duchess Favourite, De Niege, Scarlet Nonpareil, Brandy Apple, Golden Reinette, Gravenstein, American Mother, Claygate Pearmain, Calville Blanche, Bess Pool, and Calville Rouge. The leading competitors have been Mr. C. Herrin, Dropmore Gardens, who secured six firsts and seven seconds; Mr. J. Powell, four firsts and three seconds; Mr. G. Woodward, Maidstone, three firsts and seven seconds; Mr. G. Wythes, Syon Gardens, and Mr. J. C. Tallack, Livermere Park Gardens, with three firsts and three seconds each; Mr. Prinsep, Buxted, two firsts; Mr. Divers, Belvoir Castle Gardens, two firsts and one second, and Mr. Bullock ditto.

The Ground-Nut (*Arachis hypogæa*) is largely exported from India to England and France for oil-making and other purposes. The cultivation of the Ground-nut was carried on extensively in Pondicherry, and the industry was so profitable that it soon became the only important one; this state of affairs was sure sooner or later to end in disaster, and, according to Captain Nepean, in a report to the Foreign Office, 1897 was a very bad year, and the harvest was scarcely sufficient to supply the local oil mills; unfavourable atmospheric conditions are given as a reason for the scarcity. The Governor of the French establishment in India, in a speech given on November 16, 1897, at Pondicherry, very clearly pointed out the inadvisability of putting all one's eggs in one basket. He stated "the commerce and industry of the colony has declined greatly; our exporting firms pay dearly for their over-estimated confidence in the cultivation of Ground-nuts. During the last two years the output has failed completely. All business has been stopped, and the traffic of the port has diminished in a proportion surpassing the most pessimistic predictions. The disasters which have followed are difficult to repair. A movement has become apparent in favour of the plurality of cultivation, which should be encouraged. This new distribution of products will assure to our colony a more staple position. There will be in it a chance of improvement, but all efforts made to this end would be themselves irremediably compromised if the oleaginous seeds embarked in our ports became liable to duty when imported into France." It would appear that the necessity of plurality of cultivation must be learned by experience, both by individuals and colonies, ere it is fully appreciated.

Highly Flavoured Pears.—In the course of the two years during which the Veitch prizes for flavour have been competed for at the Drill Hall, Westminster, there have been about a hundred and thirty-three dishes of pears staged, representing a large number of varieties; from these, however, only twenty-nine sorts were considered sufficiently well flavoured to merit a prize, and these were as follows: Winter Nelis, Nov.-Jan., three firsts and one second; Doyenne du Comice, October, three firsts; Thompsons, October, two firsts and one second; Jargonelle, July-August, two firsts: Passe Crassane, February, two firsts; and Bergamot d'Esperen, Feb.-March, one first and two seconds. Williams bon Chretien, Aug-Sept.; Souvenir de Congres, September; and Emile d'Heyst, Oct.-Nov., each gained a first and a second prize. The prizes were won on one occasion only with Beurré de l'Assomption, August; Beurrê d'Anjou, November; Beurré du Buisson, November; Beurré Rance, March; Louise Bonne of Jersey, September; President Barabe, December; and Josephine de Malines, January. Second prizes were won on two occasions with Beurré Brettoneau, Feb.-May; Knight's Monarch, November; Glou Morceau, November; and Nec Plus Meuris, Jan.-March. On one occasion only have the following varieties merited the second prize, and in the months indicated: Citron des Carmes, July; Beurré d'Amanlis, September; Beurré Hardy, October; Beurré Superfin, October; Marie Guise, March; Autumn Nelis, September; Fondante d'Automne, September; Marie Louise, October; and Nouvelle Fulvie, November. The most successful competitors were Mr. G. Woodward and Mr. C. Herrin, the former winning six first and two second prizes, and the latter five firsts and one second, with the exception of Mr. J. Powell no other competitors gained more than one first prize, but he obtained three firsts and a second. Messrs. G. Wythes, W. Cotterell, G. Osborne, O. Thomas, W. H. Divers, C. Ross, W. Allan, J. Crook, F. Harris, W. King, R. Maher, and G. Norman, divided the remaining nine first and nineteen second prizes between them.

Preservation of Scenery.—The desirability of preserving scenes of beauty is at last being recognized by some portion of the community, and the other day a conference was held in one of the committee rooms of the House of Commons, with Mr. Bryce, M.P., in the chair. There was a somewhat lengthy discussion, in the course of which the several aspects of the question were touched upon, and, at the close, a resolution, moved by the Duke of Westminster and seconded by Sir William Vincet, was unanimously passed, declaring it to be desirable to make some permanent arrangement for concerted action between members of Parliament in both Houses on questions relating to (a) the protection of rural scenes and landscapes and town prospects from such disfigurement and impairment as is not justified by considerations of public utility; (b) the provision and maintenance of commons, open spaces, public parks, and gardens; (c) the preservation of buildings and places which are of peculiar interest by age, beauty, or association, whether historical or literary; (d) the conservation of wild animals and plants; and generally for asserting the importance, on [illegible] grounds of public policy, of maintaining beauty, simplicity, dignity, and interest in the aspect of out-of-doors Britain. Resolutions were passed appointing a committee to undertake the duty of circulating information, and of inviting con[illegible] and common action when it appeared that steps might usefully be taken in Parliament.

Railway Companies and the R.H.S.—Early in March last the Council of the Royal Horticultural Society proposed to the various railway companies that Fellows of the society should be permitted, upon presentation of their cards of fellowship at any station, to obtain a return ticket to London, at single fare, upon show-days, and especially on the occasion of the Temple Show. It was pointed out, in the circular letter sent by the Rev. W. Wilks, that such a privilege was granted to the Bath and West of England Agricultural Society, Royal Counties' Agricultural Society, and other bodies, to the advantage both of the societies and the railway companies. In reply, the companies intimated that the matter was discussed at a meeting of the Associated Railway Companies and the proposal declined.

Convenient Flowers.—A writer in an American contemporary points out that flowers are very convenient. Suppose, he says, it is desirable at the last moment to break a dinner engagement from choice or necessity. If the note which explains your sudden call out of town is accompanied by a box of roses the lady feels less sting, and you miss much of her displeasure. Or suppose the girl you admire is going abroad, and you are diffident about suggesting a correspondence. Flowers sent to the steamer will arrange the whole thing for you. The recipient must acknowledge them, you answer the note she posts from the first port at which the steamer stops, and the desired correspondence is established. Then there is the birthday for which you forget to purchase a gift, or the social debt you owe. Some handsome flowers will take the place of these things, and give you the reputation of being a man of taste.

Messrs. S. Chivers and Sons, of Histon, Cambridge, have just celebrated the twenty-fifth anniversary of the opening of the first fruit farm factory in England. This firm started in a small way, and by careful attention to growing fruit, packing, preserving, jam making, &c., has grown rapidly, until now it has six hundred acres under cultivation, and employs eight hundred persons.

Some New Hoes have been on trial for some time past at the Chiswick Gardens of the Royal Horticultural Society, where their usefulness for various purposes has been proved. The Sproughton Hoe, an invention by the Rev. Foster-Melliar, of rose-growing fame, is a double-edged Dutch hoe, that cuts through the soil readily, cutting up weeds whether pushed from or pulled towards the user; a point at one end of the hoe is a valuable aid in the eradication of deep-rooted weeds. The Chiswick report gives the Sproughton implement as "a most useful hoe." Mr. G. Abbey, Eltham, sent a heart-shaped hoe that is valuable for drilling, but unsuitable for other use. The third hoe is more curious than either of the foregoing, and no doubt some of our readers will remember a specimen shown at the Drill Hall a short time ago by Mr. Wythes. It is composed of several strong prongs that revolve on an axle, and is an admirable instrument for light and loose soils, in which it can be worked much as the hand cultivators are. It is easily worked in light soils, and penetrates deeply enough to root up all but the deepest of weeds. On hard soils it would not be valuable. This pronged hoe was sent to Chiswick by Mr. Shailer, Avenue Road, Brentford.

The Botanical Magazine for the current month contains illustrations and descriptions of Coelogyne Swaniana, a pretty species from the Phillipine Islands, and resembling C. Dayana; Callianthemum rutæfolium var anemonoides, a native of the European and Asiatic Alps; Iris Grant-Duffi, a yellow-flowered species from Palestine, closely allied to I. tenax; Eria latibracteata, a Bornean orchid with dull yellowish flowers; and Calochortus clavatus, a bright yellow species lately introduced to cultivation by Mr. Carl Purdy.

A Novel Find of Gypsum.—In a communication to *Nature*, Mr. T. Mellard Reade states that a very large boulder of gypsum has been uncovered by the excavations in the brickworks of Mr. Ed. Peters, Cooks Lane, Great Crosby, near Liverpool. It is embedded in and completely surrounded by a thick bed of brown boulder clay, the bottom of the boulder being about seventeen feet below the surface of the ground. The boulder measures eleven feet by six feet extreme dimensions, and weighs about thirteen tons. Small pieces of gypsum and plates of selenite are not uncommon in our boulder clays; but this individual boulder not only far surpasses in size any drift fragments of gypsum hitherto found, but is actually the largest boulder of any sort that Mr. Reade has seen taken out of the boulder clay, or recorded from it in the neighbourhood of Liverpool.

The American Strawberry Crop has been a good one this season as regards quantity, but as all the fruit seemed to ripen at once the market fell, and good fruits sold at ten boxes for a shilling and a half-penny. The *Rural New Yorker* states that in San Francisco some idiot started a poison scare, claiming that growers were spraying their strawberries with some poisonous material. The result was that many people stopped eating strawberries, and this added to the other troubles of the strawberry grower. The earlier fruits seem to have made the money this year, although the very late ones brought fair returns.

A Curious Chinese Prescription.—Mr. J. R. Burtt Davy, formerly a member of the Kew staff, now attached to the University of California, Berkeley, U.S.A., has presented to the Kew Museum the ingredients of a Chinese prescription purchased by him at China Town, San Francisco. As is well known, the Chinese use a very large and varied assortment of products in the preparation of their medicines, and Mr. Davy says that, in the drug stores of China Town, one can usually obtain a panacea for all ills, varying in the number of ingredients according to the price paid (25, 35, or 50 cents). Such a prescription usually contains a few slices of the root of Glycyrrhiza, dried flower heads of a composite plant, dried [illegible], dried cockchafers, and the skin, head and tail of a lizard stretched on thin sticks; an extra five cents will secure a dried "Sea horse"; and yet another five cents a dried fish of peculiarly narrow shape, and about four inches in length. All these are boiled together, and the decoction drunk as a remedy for heartburn, toothache, cough, dimness of sight, and almost any other ailment. It is difficult to identify most of the vegetable ingredients in consequence of their being cut or broken up into small fragments, but the following occur amongst those brought to Kew. Fruit heads of an Eriocaulon, apparently E. cantoniense. This plant has a reputation in China for various diseases, such as ophthalmia, especially in children, as a styptic in nose bleeding, and in affections of the kidney. Another ingredient capable of identification, consists of the spiney hooks from the stems of the Gambier plant (Uncaria Gambier, Roxb.), which have astringient properities, and are mostly used in infantile complaints. Some very thin transverse sections of the stem of Akebia quinata, a climbing berberidaceous plant, also occur in small quantities, as well as the bark of Eucommia ulmoides, known as the "Tu Chung." Tonic and invigorating properties are ascribed to it, and it is said to be valued at as much as 4s. to 8s. per pound. Though the bark is very thin, it is abundantly sharged with elastic gum, which can be drawn out in silvery threads when it is broken apart. Among other ingredients which have not been identified are crushed flower heads of a composite plant. and slices of a slender, twig-like stem, probably a willow.

The Vineyards of France do not appear to be in a very flourishing condition at present, owing to the low temperature that has for so long prevailed. In almost all parts of the country much warmer weather is needed, both for the vines and sugar beet. In the south-eastern districts the vine growers are complaining of the premature falling of grapes, while in other districts the excessive humidity of the season has resulted in an unusual development of fungoid pests. The grape harvest is certain to be late, and it will be a small one unless more congenial weather ensues.

Paraguay Tea or Mate can be obtained from more than one species of plants, as notes on the botany of those yielding it were published in the *Kew Bulletin* of 1892, pp. 132-137, will show. In 1893 seeds of what was believed to be true Ilex paraguensis were received at Kew through the kindness of Senor Glaziou, Director de Passeio Publico, Rio de Janeiro. After retaining a few the others were distributed to various botanical institutions in the Colonies. Unfortunately none of the seeds sown at Kew germinated. The following interesting information respecting the tea made from the leaves, so largely used in South America, is taken from a report issued by the Foreign Office in 1897: Yerba-maté, or Paraguayan tea, is the most valuable article of export. There are two classes sold, but it is only in the manner of preparation that they differ. The kind known as "Mborovirè" is merely dried over a furnace, and then beaten into small pieces with sticks. The "Molida" goes through the same process, but it is afterwards ground in a mill. The export duty on the former was increased in 1895 from 30c. paper to 10c. gold, and on the latter from 25c. paper to 9c. gold per 10 kilos. The revenue derived from this source in 1895 amounted to 471,668 dollars (equal to £16,845). The Yerba forests, called Yerbales, were formerly the property of the State, but most of them have been sold, and are now in the hands of a few capitalists and companies. The Industrial Paraguaya Company, which owns about half of the Yerbales known to exist in the country, exports annually about 400,000 arrobas (4,512 tons). The total quantity of Yerba exported during the past year is estimated at about 9,024 tons, and the average price per arroba (25 lbs.) was 11 dollars 50 cents paper (equal to 7s. 8d.). Paraguay tea is now advertised for sale in this country, and appears to be in moderate demand; possibly as a curiosity more than as a regular article of food.

State Aid for Horticulture.—At the distribution of prizes and diplomas to successful students at the Horticultural College, Swanley, on Wednesday last, Sir Trevor Lawrence stated as a remarkable circumstance that, although we in this country were more distinctly a flower-loving people than the inhabitants of any other country that he knew of, the State did nothing in the direction of systematic horticultural education. In Belgium, Holland, France, and Germany the State undertook to establish a satisfactory system of horticultural education, whereas we in this country had to rely on individual effort. He did not say that ours was a wrong course, but at the same time it was perfectly clear that it was much more difficult to establish a satisfactory system of education by private effort and energy than it would be if we had the resources of the State at our command.

The Palm Oil Trade conducted between this and numerous tropical countries is very large, and a study of the business, even superficially, would prove most interesting. In Paraguay the Agricultural Bank has for some time past been encouraging the palm oil business by importing crushing machines and selling them at cost price; it has also purchased quantities of palm nuts and demonstrated the profitableness of home crushing as against the direct export of nuts to Liverpool. Mr. Consul Holmes states, in his report for 1897, that some two thousand sacks of the kernels were sent by the bank to Liverpool, and sold there for £1,091 16s. 1d. The expenses, freights, commissions, insurance, etc., amounted to £155 18s. 4d., so that the net amount realised was £935 17s. 9d. In currency the cost per arroba (twenty-five pounds) delivered in Liverpool amounted to 3 dols. 30 c., and the profit on each arroba to 43 c. The price of the African palm nut (*Elæis guineensis*) in London in July last varied from £9 10s. to £10 per ton. Whereas the Paraguayan nut, owing to its yielding more oil, fetched from £11 5s. to £11 10s. per ton. Since this experiment was made, the bank has received orders for large quantities from London and Naples, the latter being for 10,000 tons at £11 per ton. But though the cocoa-palm grows like a weed in most parts of the country, it is extremely doubtful whether these orders can be executed owing to the difficulty of collecting the nuts. And for this the peasant is to blame, as it is said he finds the task of collecting and crushing the nuts too laborious and not sufficiently remunerative to suit his usually desultory and happy-go-lucky methods of earning a living.

Lichens and Mosses.

It may not be out of place if we give here some few particulars relating to these two peculiar forms of vegetation which form the heading to this article. Taking lichens first, I find that the word is derived from the Greek λειχην, and in the botanical world it is the name for an extensive division of cyptogamic plants, constituting a genus in the order of algæ, in the Linnæan system, but now forming a distinct natural order known as Lichenaceæ. They appear in the form of thin, flat crusts, covering rocks and the bark of trees, or growing upon the ground, or in foliaceous expansions, or branched like a shrub in miniature, or sometimes only as a gelatinous mass or a powdery substance. They are respectively commonly known as rock moss and tree moss, and some of the liverworts are of this order. They also include the Iceland moss and reindeer moss, but they are entirely distinct from the true mosses. Lichens abound in the cold and temperate parts of the world. The greater number are of no known use, except in preparing the surface of the earth for the reception of larger growing vegetation; but some are used as tonic medicines, such as Variolaria fuginae and Iceland moss. Cetraria islandica, when deprived of its bitterness by boiling, becomes a diet recommended for invalids. Their principal use is to furnish the dyer with brilliant colours, orchil, cudbear, and several others being thus employed.

Having thus briefly summarised the uses of lichens, I will now proceed to touch upon the subjects from the botanical point of view. We are all familiar with the ordinary appearance of a lichen. It is a dry membraneous-looking object, whose external aspect scarcely invites attention, but if examined closely many wonders reveal themselves. A mass of cells, a number of little tubes of membranes, containings porules of an oval form, both outer and inner layers, are disclosed on microscopic examination. The colour and appearance of the plants are wonderfully diversified. They may be seen drooping from the branches of trees in thick beard-like bunches or tufts, and are called in this form Old Man's Beard, which in their aspect and hue they positively resemble. They are found growing on the walls of old castles or ruined churches, with curious-looking patches of brown or yellow. They glitter in golden colours, and paint a bare rock with strange devices sometimes in the richest, but oftener in the gloomiest of colours, and at times form miniature goblets in grey with crimson edges. They are really nearly ubiquitous, few places coming amiss to them. They cover weather-beaten rocks, and subsist equally on the sea-shore, and are scattered from the equator to the poles, from the depth of deserted mines to the height of everlasting snow. England is rich in lichens, but cannot compare in that respect with the moist equatorial regions, which greatly favour their development. The most curious lichens in this country are those called "Lungs of the Oak," from their remarkable resemblance to the human lungs; the hair lichen, which covers trees with a shaggy mantle; the crab's eye, common upon stones; and the goblet, which ornaments so many of our heaths. How lichens appear in many places is a great mystery, and experiments made to solve the matter result in engendering increased perplexity. Meyer found that decomposed vegetable and some inorganic matter will assume an organisation under the influence of water and light, and that the pulverulent matter of lichens is thus propagated, but species could only be propagated by spirules of the same species. D'Unville tells us pulserulent lichens are the first plants which appear on bare rocks of newly-formed islands. This is the first garment at the hands of Nature.

Lichens from a commercial point of view are of value. For more than half a century numbers of the population in the Highlands of Scotland have earned a fair living by collecting the Lecauora tartara, or cudbear, scraping it off the rocks on which it grows so abundantly in those parts. Loudon states that when large quantities were collected it was then sent to Glasgow, where it was employed for dying wool purple. It is not so good though as that sent to us from the Canary Islands. The orchal or orchil which is, procured from the volcanic rocks there, is used here in large quantities, the value imported being over £100,000 annually. The well-known chemical test called Litmus is produced from the colouring matter of orchil. Other lichens give us yellow, blue, and red (the primary colours) dyes.

Coming now to the mosses, it may be mentioned that these form one of the families or classes into which all vegetables are divided by Linnæus in the "Philosophia Botanica." In Ray's method the mosses form the third class, and in Tournefort's they constitute a single genus. In the sexual system they are the second order of the class Cryptogamia, which contains all the plants in which the parts of the flower or fruit are wanting or are not conspicuous. They form a natural order of small plants, with leafy stems and narrow simple leaves. Their flowers are monæcian or diœcian, and their spores are contained in a capsule covered with a calyptra or hood. A pretty moss clothes the sides of St. Winifred's Well, at Holywell, North Wales, which seems stained with blood, the legend being to the effect that St. Winifred was beheaded and thrown down the well, and that her blood has ever since tinged the moss-covered sides. The moss family has in many other instances lent itself to tradition. It is, of course, under the microscope that the mosses afford most wonder. The mosses, like the lichens, are cosmopolists. The split mosses luxuriate in the bleakest spots, and are among the last vegetation found in the Alps at the everlasting snow limit. Some of the urn mosses are to be found at a height of 7,000 to 8,000 feet. From the heights downwards, and from the tropics to the poles, certain mosses are to be found. They are not so useful though to man as the lichens. In Lapland they make beds of them, and also use them as candlewicks; reindeer, too, eke out their sparse provisions with them, but really little else can be written.

Wm. Norman Brown.

CHRYSANTHEMUMS.

MANURES AND FEEDING.

The occasion for complaining about the weather might almost be considered the special prerogative of gardeners generally, and especially those who plunge deeply into the cultivation of specimen chrysanthemums, judging from the chorus of perennial grumbles with which one is greeted amongst brothers in the craft. This present season, with its abnormally low temperatures and lack of sunshine, bears the same evil reputation as most of its predecessors, and yet one may safely predict that November will bring its wealth of lovely flowers and keen competitions, as it always has done. We are like a certain farmer who, when complimented on his fine crop of wheat, complained "that there was a dreadful lot of smut if you looked into it." Chrysanthemum "smuts" are various and persistent in their attacks on the plants, but they cannot withstand the watchful care of the earnest cultivator. Some of these troubles, however, are the result of our own misguided kindness to the plants, and there is no more prolific source of evil than errors in the application of manures. It is a pardonable error with beginners that they should be too liberal with special fertilizers, even to the extent of destroying some roots when, without much experience, they are trying to steer their own ship, and to some extent also that they should rejoice (during the growing season) in the large fleshy leaves and bamboo-like stems which result from early and constant doses of stimulating manures. In talking with people who persist in this style of growing their plants, it is most amusing to note the pains they take to assure you "that scarcely any manure has been given," that "there is nothing but a dusting of bone meal in the soil, &c.," the veracity of which statements can only be admitted on the assumption that they do not measure their quantities by our standard. Not long since I saw, amongst a collection of large stemmed plants, one of Madame Carnot, with the main growth divided right through the centre, showing quite a hollow stem, surely a condition which cannot result satisfactorily. It has been frequently urged upon those readers who have still this lesson to learn, that fine blooms are produced on solid, sturdy, well-matured growth, and that gross, succulent plants will not yield nearly such good flowers as those with comparatively small but sound shoots.

Other evils consequent on too high feeding, also, are "damping" of the blooms, a predisposition to the attacks of mildew and of the new fungus or leaf rust which will establish its spores much more readily on soft, fleshy foliage than on leaves of hard texture. A robust, healthy growth is, of course, necessary to enable the plants to develop high-class flowers, and considerable use of manure is requisite to obtain this, but caution against extremes is very important. Plants which were potted early in June will, by this time, have freely occupied the soil with roots, and are in condition to receive weak supplies of liquid manures. As we do not use soot in the soil for potting, a light dusting of the surface will prove a simple means of affording this stimulant now, or otherwise it may be supplied in water, a bag of soot being plunged into the tank from which supplies are taken. The former method answers well during showery weather. Give this once all round to the plants, then a weak watering of liquid cow manure may follow after clear water has been used for a day or two. As the season advances and the extra growth demands more support owing to the partial exhaustion of the soil the supplies of liquid manure may be more frequent and varied. Drainage from stables or farm yard, diluted to a safe condition, is a good manure, usually one of the strongest. Manure from horses or poultry may be also used in the same way as the soot by placing a quantity in a coarse hemp bag and plunging in a tank of water. It is well to bear in mind that of the animal manures, that from cows is the weakest and from poultry the richest, the latter consequently requiring more dilution. The sediment which would collect on the surface soil if the manure were stirred loose in the tank, is avoided by using the hemp bags, and very properly so, because it is very essential to keep the soil perfectly free and porous to the constant supplies of water which the plants require. At a later period a light dusting of either of the special manures, may be given with advantage, as a change, always following with clear water for a few days. Plants require less manure during rainy weather, and this must especially be taken into consideration later in the season.

The leaf mining grub has been more troublesome than usual this year, handpicking is the remedy, and though the attacks of the insects will cease by the end of July, it is important to destroy as many as possible to prevent injury to the lower leaves and ultimate increase of the fly which, through its eggs, produces the grub. Attention in tying the shoots is extremely important with such very brittle varieties as Snowdon, Mary Molyneux (a very free growing sort), Joseph Brooks, and Australie, heavy rains being usually as destructive to the tops of such varieties as rough winds. The side shoots must be kept carefully removed, and little services of this kind must be regularly carried out to keep the plants in proper trim, and to confine their energies to building up sound growths and future buds. A caution, too, may be given, against the "taking" of buds too early. Very few, indeed, should be retained until the middle of August. Mrs. Weeks must not be allowed to grow on again if the bud shows during the first week of next month, or the succeeding flower bud will be much too late, so also with John Neville and several others. Generally speaking, all buds which show during July must be passed, and those from the middle to the end of August secured.

Trent Park Gardens.

W. H. Lees.

THE ALPINE AURICULA.

I NEED not go into the history of the auricula, nor speculate from what original source this charming hardy garden flower has sprung; as the supposed original parent was cultivated in our gardens three hundred years ago, it stands to reason that the variation from so many generations of seedlings must be very great, but it is also true that the Alpine auricula (so called, for they are all Alpine) never was taken up by the fanciers as the edged auricula has been. When the silk weavers were expelled from the low countries and settled in Spitalfields, they brought the edged auricula, but not the Alpine. The hand-loom weavers about Manchester could not find room for it in their gardens, nor have I ever seen a plant of it in the gardens of those two famous cultivators, Mr. Ben Simonite and the Rev. F. D. Horner.

It is a matter of taste, or it may be a matter of convenience; my own opinion is that the Alpine auricula is a lovely flower, charming in its rich and varied colours, in the delicate perfume of the blooms, and its easy culture. Plant a group of, say, a dozen Alpine auriculas, all one variety; mix different varieties in the group, it does not matter. I put out a dozen plants of a choice variety, Gorton's Diadem, and the second season I counted one hundred trusses of beautiful blooms, and they grew well and flowered well without removal for ten years. Seedlings are also charming out of doors. Hear what a celebrated florist says in a letter to me: "I have one of the grandest shows of auricula seedlings I have ever seen. They constitute three beds, raised from seed, and are masses of gorgeous bloom. . . . The luxuriance of growth, the delicious scent which fills the air, and the bizarre combination of colours is perfectly entrancing. And what colours they are! Every shade and combination of the older imperial colours of purple and gold, down to the softest violet and primrose, and some yellow. Just now they constitute the glory of the garden, and I am delighted with them." This is surely a very favourable testimonial for the culture of this charming alpine in the open air in England. Give it good, deep soil, and plenty of decayed manure; but see that the manure is placed six inches below the surface, so as not to come into immediate contact with the roots.

It is easy to raise a good stock of auriculas from seed. The seed should be sown in July, as soon as it can be obtained, as auricula seed does not keep well. Cover the seed very lightly, and place in a garden frame, in a greenhouse, or hothouse. I put my auricula seed-pans in the cattleya or intermediate orchid house this year. The moist, warm atmosphere, with a minimum temperature of 60 degrees, seemed to suit them admirably, and the plants appeared above ground in about two weeks. They have now been pricked out in pots or boxes, and are doing well. I advise sowing in seed pans, flower pots, or boxes, and prick the plants out in boxes as soon as they are large enough, and when they are [illegible] to the open air plant them where they are to flower. The [illegible] varieties may be planted out in the same way. A good time to transplant and divide up the plants is in July and August, after the [illegible] has been gathered. This class of plant likes good, deep, rich, clayey loam; it does well on my chalky soil, where primroses and cowslips grow naturally. On light, sandy soil it is better to add some clayey loam, and when transplanting let the plants be set deep into the ground; all bare stems should be covered with soil, for auriculas and primulas have a tendency to throw out roots at the base of the leaves. It [illegible] hardy garden plant than the Alpine auricula can be recommended. As a choice plant for growing in pots this sweetly-scented favourite is [illegible] greatly esteemed, and cultivated thus it is an endless source of pure enjoyment to those who have studied its characteristics.

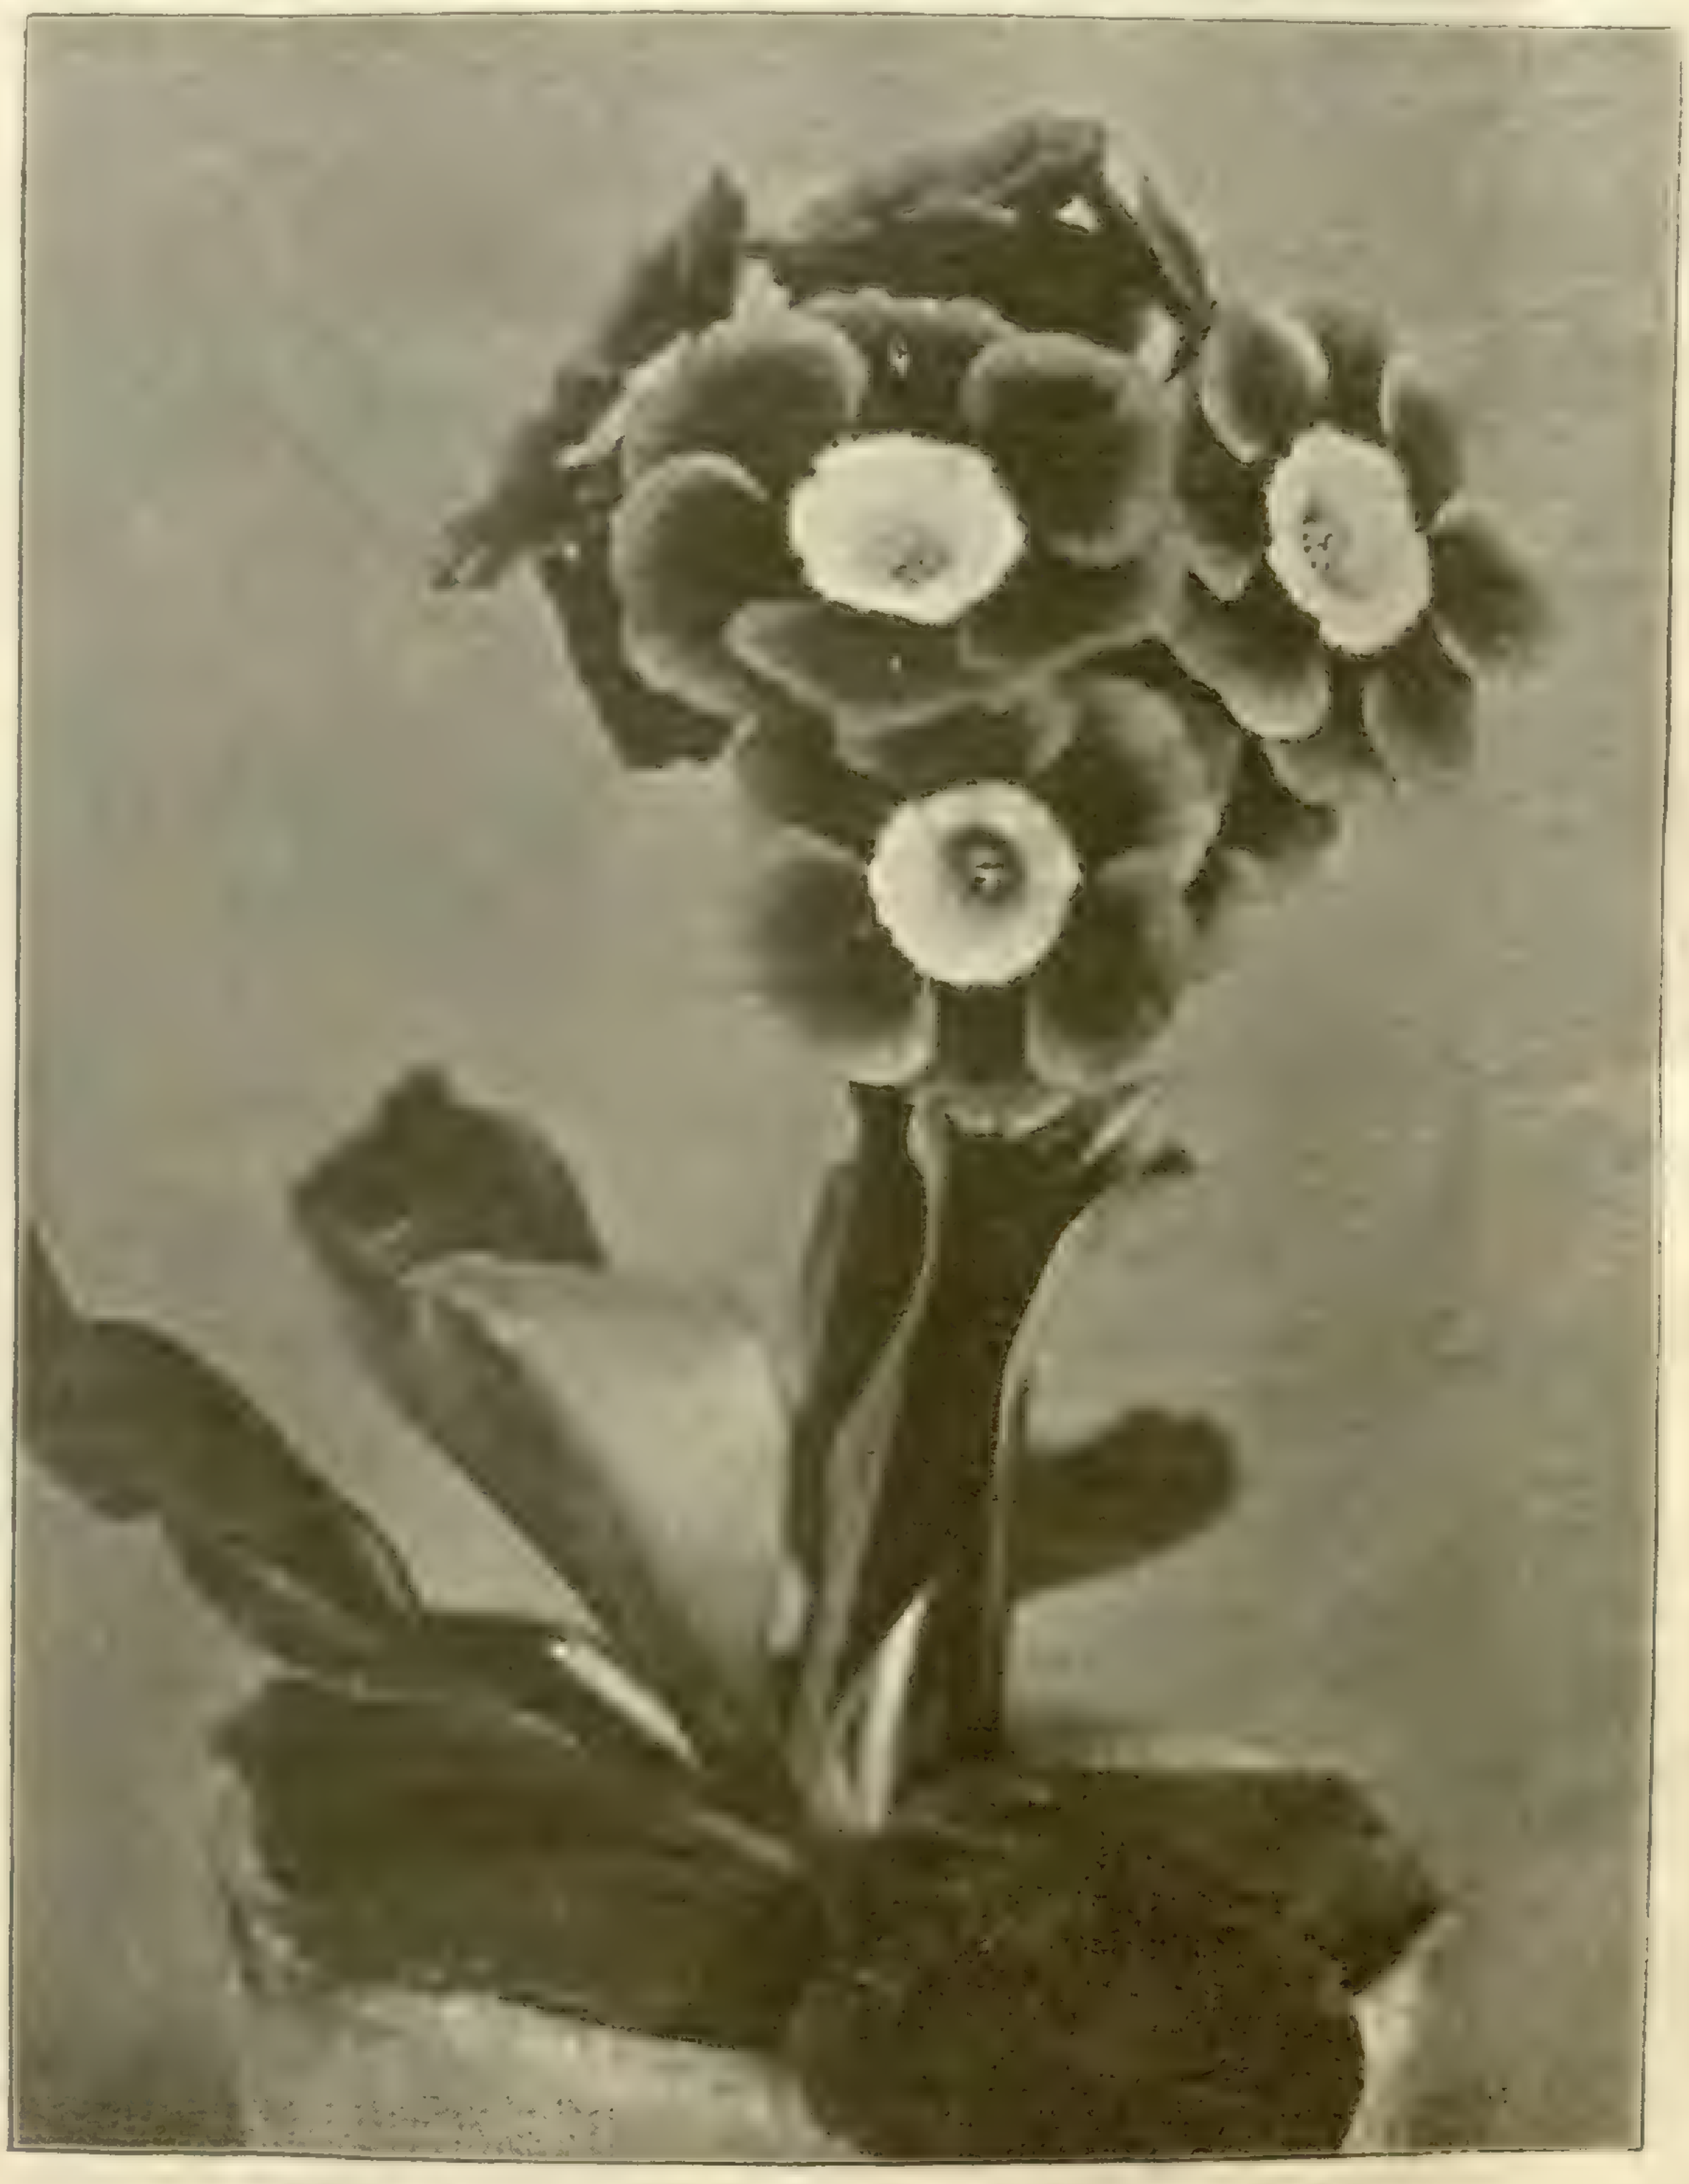
Alpine auriculas are easier to manage than the so-called show section, and the plants grow more freely, and will come into bloom sooner; but it takes about eighteen months to grow a plant from seed into a full-sized [illegible] specimen, and a small offset will take very nearly as long. After "full" plants, as the fanciers term them, have been obtained, no plant is easier to cultivate; place the plants in an ordinary garden frame if possible on the north side of a high wall or building, and in such a position they will not require further shading, nor do they need very much water at the roots; the plants are re-potted once a year, in May, using a compost of three or four parts good loam, one part decayed manure, and one of leaf-mould; but the latter is not essential. I have used the loam and manure only, with no other addition, and with unqualified success. The flower pots used vary in size according to the vigour of the plants; the largest used are four-and-a-half inches in diameter, and the smallest three inches inside measure for flowering plants; the offsets are planted in thumb pots, and it takes two to three months for an offset to become established in one of these; they are potted on as they require it, using rather finer loam. When the plants are established, they require plenty of air.

They are not liable to be attacked by insect pests or fungoid diseases, excepting the woolly aphis (*Trama auriculæ*), which clusters around the roots at the neck of the plants, as well as below ground, for even the drainage may become a moving mass of white fluff. The insect does not seem to do much harm, at least, the plants do not show that they suffer in any way. One amateur made the remark that the woolly aphis lodged but did not board on the Auricula roots. Green fly is sometimes troublesome with plants grown under glass; fumigate, if the frames can be made close, or dust with tobacco powder. I think I have now given all needful instruction to amateurs wishing to take up the culture of this choice favourite of our gardens.

The variety, Apollo, of which an illustration is given herewith, is one of the novelties I had the pleasure of exhibiting at Westminster during the past spring; it has already been described in these columns.

J. DOUGLAS.

Edenside, Great Bookham



NEW ALPINE AURICULA APOLLO (DOUGLAS).

NEW STRAWBERRIES.

BY the invitation of Messrs. Laxton Brothers, I had an opportunity a short time since of inspecting their extensive collection of seedling and other strawberries in the vicinity of Bedford. In addition to the large number of sorts already in commerce, I found upwards of two thousand lots of seedlings, many of which are of great promise, and bid well to supersede those already known to the horticultural world.

The early sorts only were sufficiently advanced to enable me to give a decided opinion about them. These were then in full fruit, and the tasting was quite a task with so many; the whole set occupying no less than fourteen acres of ground. I found "Monarch" and "Leader" in grand form, both of which are in commerce at the present time. Amongst the unnamed seedlings several varieties seemed certain to surpass those already introduced for size, earliness, colour, and quality.

The Messrs. Laxton Brothers seem determined not to introduce any unless they are really good in these respects, and as their Royal Sovereign has given such great satisfaction, and is now being grown by nearly all large growers, besides being in nearly all large gardens, it appears as if every confidence may be placed in their future introductions. As these are not yet named, I can only refer to them by their parentage. But I have noted the tally numbers for future reference, and hope in any subsequent inspection to prove that I formed correct opinions of their good qualities, which I hope to report upon another season. I have omitted to mention one which is an excellent variety, the fruit being wonderfully bright red, large, and solid. This has been named "Mentmore" and is the principal novelty in Messrs. Laxton Brothers' new list of strawberries.

The most effective crosses which have been secured, with fine handsome fruit and solid flesh, are from Sir Joseph Paxton and Noble, Sir Joseph Paxton and Royal Sovereign, Commander and Royal Sovereign, Vicomtesse Hericart de Thury and James Veitch, Monarch and Scarlet Queen, British Queen and Royal Sovereign. The later sorts are the result of crossing Latest of All and Royal Sovereign, Latest of All and Noble.

Aylestone, Leicester. JOHN HARRISON, F.R.H.S.

SOME ROCK PLANTS FLOWERING IN JUNE.

IF asked what has been my most beautiful rock plant this season, I should reply without hesitation Æthionema grandiflorum (Boissier). This year I had ten or twelve large plants, a foot and a half high and two feet across, presenting a surface of flowers, of a most vivid and clear pink, ornamenting different parts of my many stone heaps during June. The plant belongs to the order Cruciferæ, and is a shrub in the same sense as a wallflower is a shrub, the stem and twigs increasing in hardness and in the number of their shoots until, at about three years old, the circulation of sap seems to become difficult, and the plant succumbs to winter, or dies off after flowering. Those I am now celebrating, thanks to last mild winter, are mostly in their fourth year, but I do not expect any to survive till another spring. I find in the Kew authorities Persia given as the native country, but E. Boissier, whose botanical researches include Persia, mentions only one place where it occurs, and that is in the centre of the Caucasus, on one of the lower slopes of Mount Elbruz. I do not find its cultivation easy, though it may be raised from cuttings, and in favourable seasons ripens a good deal of fertile seed. But when the cuttings are struck and the seed raised, and the plants nursed in a frame to flowering size, they are not always easy to establish in their flowering place. Under an overhanging stone on the rockery side, facing south, they are most likely to succeed, and no pains are thrown away which result in keeping up a stock. Some of the plants die after flowering once, and few survive a second flowering, so the display this spring has been exceptional.

Another success in this garden is Lithospermum Gastoni, discovered fifty years ago on the High Pyrenees, near Eaux Bonnes, by the botanist whose name it bears. It is closely allied to the native L. purpureo-cœruleum, but is less than half the height, being only six inches, and has larger flowers, and does not spread like that species does by turning over the stem to the ground, and rooting from the terminal tuft. In fact, it increases very slowly; plants which have been growing healthily in the same spot for ten years are not making more than ten close-growing flowering-stalks. Hence, though very hardy and easy to cultivate amongst stones in strong soil, it remains a scarce plant. The next plant I am going to praise is common enough, growing on nearly all chalk or limestone downs from the Isle of Wight to Llandudno, including Epsom Racecourse; and yet few plants make a better show all through June and later on a heap of rock. It is Hippocrepis comosa, the Horseshoe Vetch. It must be planted where it can have a good breadth to spread on, for though as a wild plant it is generally strictly herbaceous, in cultivation it behaves like a trailing shrub, and in two years will cover a square yard. The flowers resemble in colour and appearance those of the common bird's-foot trefoil, a plant which becomes coarse and difficult to eradicate if cultivated. But the horseshoe vetch may be cut into any shape, and restrained in any direction, as it roots very sparingly, if at all, as it runs. The flowering is very dense and very fragrant, perfuming the air for some distance on sunny days.

June is the best month for the rock pinks. The best one of them, however, flowers in May; it is sold at the York nurseries by the name of Dianthus glacialis. I first had it by that name from the late Robert Parker, of Tooting nurseries, who grew it admirably. It is the dwarfest of its class, not more than two or three inches high, and the flowers are large and abundant. The original plant I bought nearly twenty years ago still lives where it was planted, and is not more than four inches across. It is certainly not D. glacialis, but the best Alpine botanist I have consulted about it thinks it is a hybrid of D. alpinus. I have never known it ripen a seed, though I have searched for one every year. It may be increased very sparingly and with skill from cuttings. D. alpinus does not succeed very well as a rock plant, and seems to prefer well-drained level ground, but D. neglectus is invaluable in its way. This, too, when well-placed is long-lived. The first plant of it I ever had—probably fifteen years old—still flourishes, being perhaps seven or eight inches square, and has at least a hundred flowers on it every June, so crowded as to overlap. It is on the summit of a rockery in deep, very well drained loam mixed with stone. It seeds freely every year, and the seeds if sown as soon as ripe come up at once and grow easily to a certain age; but however closely I imitate the conditions under which the original plant grows, not one seedling in ten survives the second winter. If they pass that, there is a good chance of their reaching old age, but not one can boast that it is better, or as good as its parent. Other useful rock pinks are D. cæsius, very tufty and vigorous; D. sylvestris, with larger flowers, and delighting to grow in a depression between two meeting stones; and D. viscidus, very deep crimson, but short-lived, and tending to pass, by crossing, into D. deltoides. These are tolerably well defined species, but there are many other names for which nondescript hybrids are apt to pass. Nearly all these small pinks cross freely, and the results are fertile, so that seed saved in the garden cannot be depended upon, and every generation produces a more confused tribe, few of which would pass muster for species in a genuine herbarium. An exquisite little columbine, Aquilegia pyrenaica, is later than most others, and belongs to the rockery. It is not more than six inches high, with pretty dwarf foliage and large blue flowers. It is almost the only columbine which comes true from seed in my garden, being a month later than most other columbines, so that it is less liable to be hybridised. The best of rock geraniums is G. argenteum, very dwarf, with leaves of shining silver, and flowers of pink or white, doing best in the driest chinks amongst the stones of the summit. A good ripening of seed is a rare boon, and is always made the most of here; the plants never admit of being divided, but last for several years. Some of the seedlings seem to pass into G. cinereum, a coarser kind, with less silvery leaves, so that selection should be made. Another very good geranium is G. lancastriense, held by some to be a variety of G. sanguineum, but for dwarf growth and free flowering very superior to it; its flowers are pale pink, and the height not more than three or four inches.

Two sedums in June deserve especial commendation, S. kamtschaticum, growing of moderate breadth, and not running at the roots, with conspicuous orange-coloured flowers, and continuing ornamental till seed is ripe; and S. spathulæfolium, with very close-growing silvery grey rosettes and large bunches of very bright yellow flowers on dwarf stalks. It a native of North-west Canada, and has not been long in cultivation, but will take kindly to any spot assigned to it without ever becoming obstructive or untidy. The many varieties of Veronica teucrium are now in flower, including V. prostrata, often treated as a species, and known in nurseries as V. rupestris. This is common, and apt to be weedy, but a pure white variety of it which I found ten years ago near Gavornie, in the Pyrenees, is rare and choice. It is, however, far more shy in its growth than its blue type, though the flowering is very abundant. The bushy or upright forms of V. teucrium, from nine inches to two feet high, are amongst the purest and brightest of blue flowers for the month during which they last. By growing a large number of seedlings in a spare corner an advantage will be gained by the chance of selection, for few species afford greater variety of habit, and as the best plants admit of endless division, there ought to be no room for inferior forms. Oxalis enneaphylla, from the Falkland Islands, has proved hardy with me for three winters, and is very distinct and pretty both in leaf and flower—that is when the sun condescends to shine upon it—but it makes no increase. It seems to do well at Kew, growing amongst the stones where the cross walk cuts into the middle of the rock garden from the east. It should be looked for in catalogues, but is at present scarce. I first saw it in the rockery of Mr. George Paul at Broxbourne, where it had survived a very severe winter. Of several varieties of Aster alpinus, the most easily grown is that called var. superbus, which flowers freely and grows vigorously, even on a flat border. The type is more dwarf and perhaps better as a rock plant, but is very capricious, and is difficult in many gardens to persuade to do well, especially where slugs abound, which eat the eyes out of the flowering shoots during winter. The white variety I have found unaccommodating. It wants vigour, and most of the flowers come deformed, and it is seldom seen in really good form. Lychnis Lagascæ, from the Spanish side of the Pyrenees, is a choice little June rock plant. Being evergreen, its frail stalks are little suited for the British alternations of snow and rain, frost and thaw, but I find it does admirably on the side of a brick wall, where snow cannot lodge against it. There it clings to the mortar without any visible holdfast, and makes large tufts, covered for a month with bright crimson flowers, growing mixed with erinus and similar dwarfs.

Edge Hall, Malpas. C. WOLLEY DOD.

HIBBERTIAS.

THE members of the genus Hibbertia are nearly all natives of Australia, and are among the most easily cultivated plants. Many are of a climbing habit, and form very pretty subjects for training under the rafters of a cool greenhouse, or for pillars; they have been grown outside upon a wall in favoured localities, which shows their hardy nature. As they are evergreen they are extremely useful where a roof covering is necessary all the year round, and such species as the quick growing H. volubilis soon fills up a large space if so required. Large plants are not particular as to compost, provided it is not very heavy, so a large amount of coarse sand and broken potsherds is conducive to good growth. With such species as H. Readi, allied kinds, and young plants, a mixture of sandy peat and loam is best suited to their requirements.

The number of species in cultivation is not large. The flowers are yellow, and produced over a long period. Those in most general cultivation are H. dentata, a native of Australia, introduced early in the century, and easily distinguished by its wiry stems, oblong leaves of a purplish colour beneath and light green above. This plant always displays itself to the best advantage if its growths are allowed to depend from the roof, while at the same time it presents quite a natural appearance. H. volubilis is, perhaps, better adapted for pillars or walls on account of its more stiff habit of growth; the foliage is deep green, and the flowers, which appear at the ends of short axillary branches, are about two inches across and of a bright yellow shade. When old the plant may be well spurred back, as this induces a large number of lateral growths, and, consequently, a more floriferous specimen. For pot culture we have several species which form compact plants when well grown. In H. perfoliata, also an Australian species, we have a showy plant, growing a foot or more in height, and forming quite a desirable stage plant when well grown. The flowers are produced in the axils of the perfoliate leaves, upon small side branches near the apex of the stems, six or more upon each branch. The glaucous foliage is also ornamental even when the plant is out of bloom. H. Readi, whose habitat is unknown, has small linear foliage, and forms quite a compact plant. It is very floriferous, as the blooms are borne thickly upon the small twiggy branches, the flowers appearing to nestle up to the foliage while in bud. The bright yellow colouring makes it a conspicuous object among other plants.

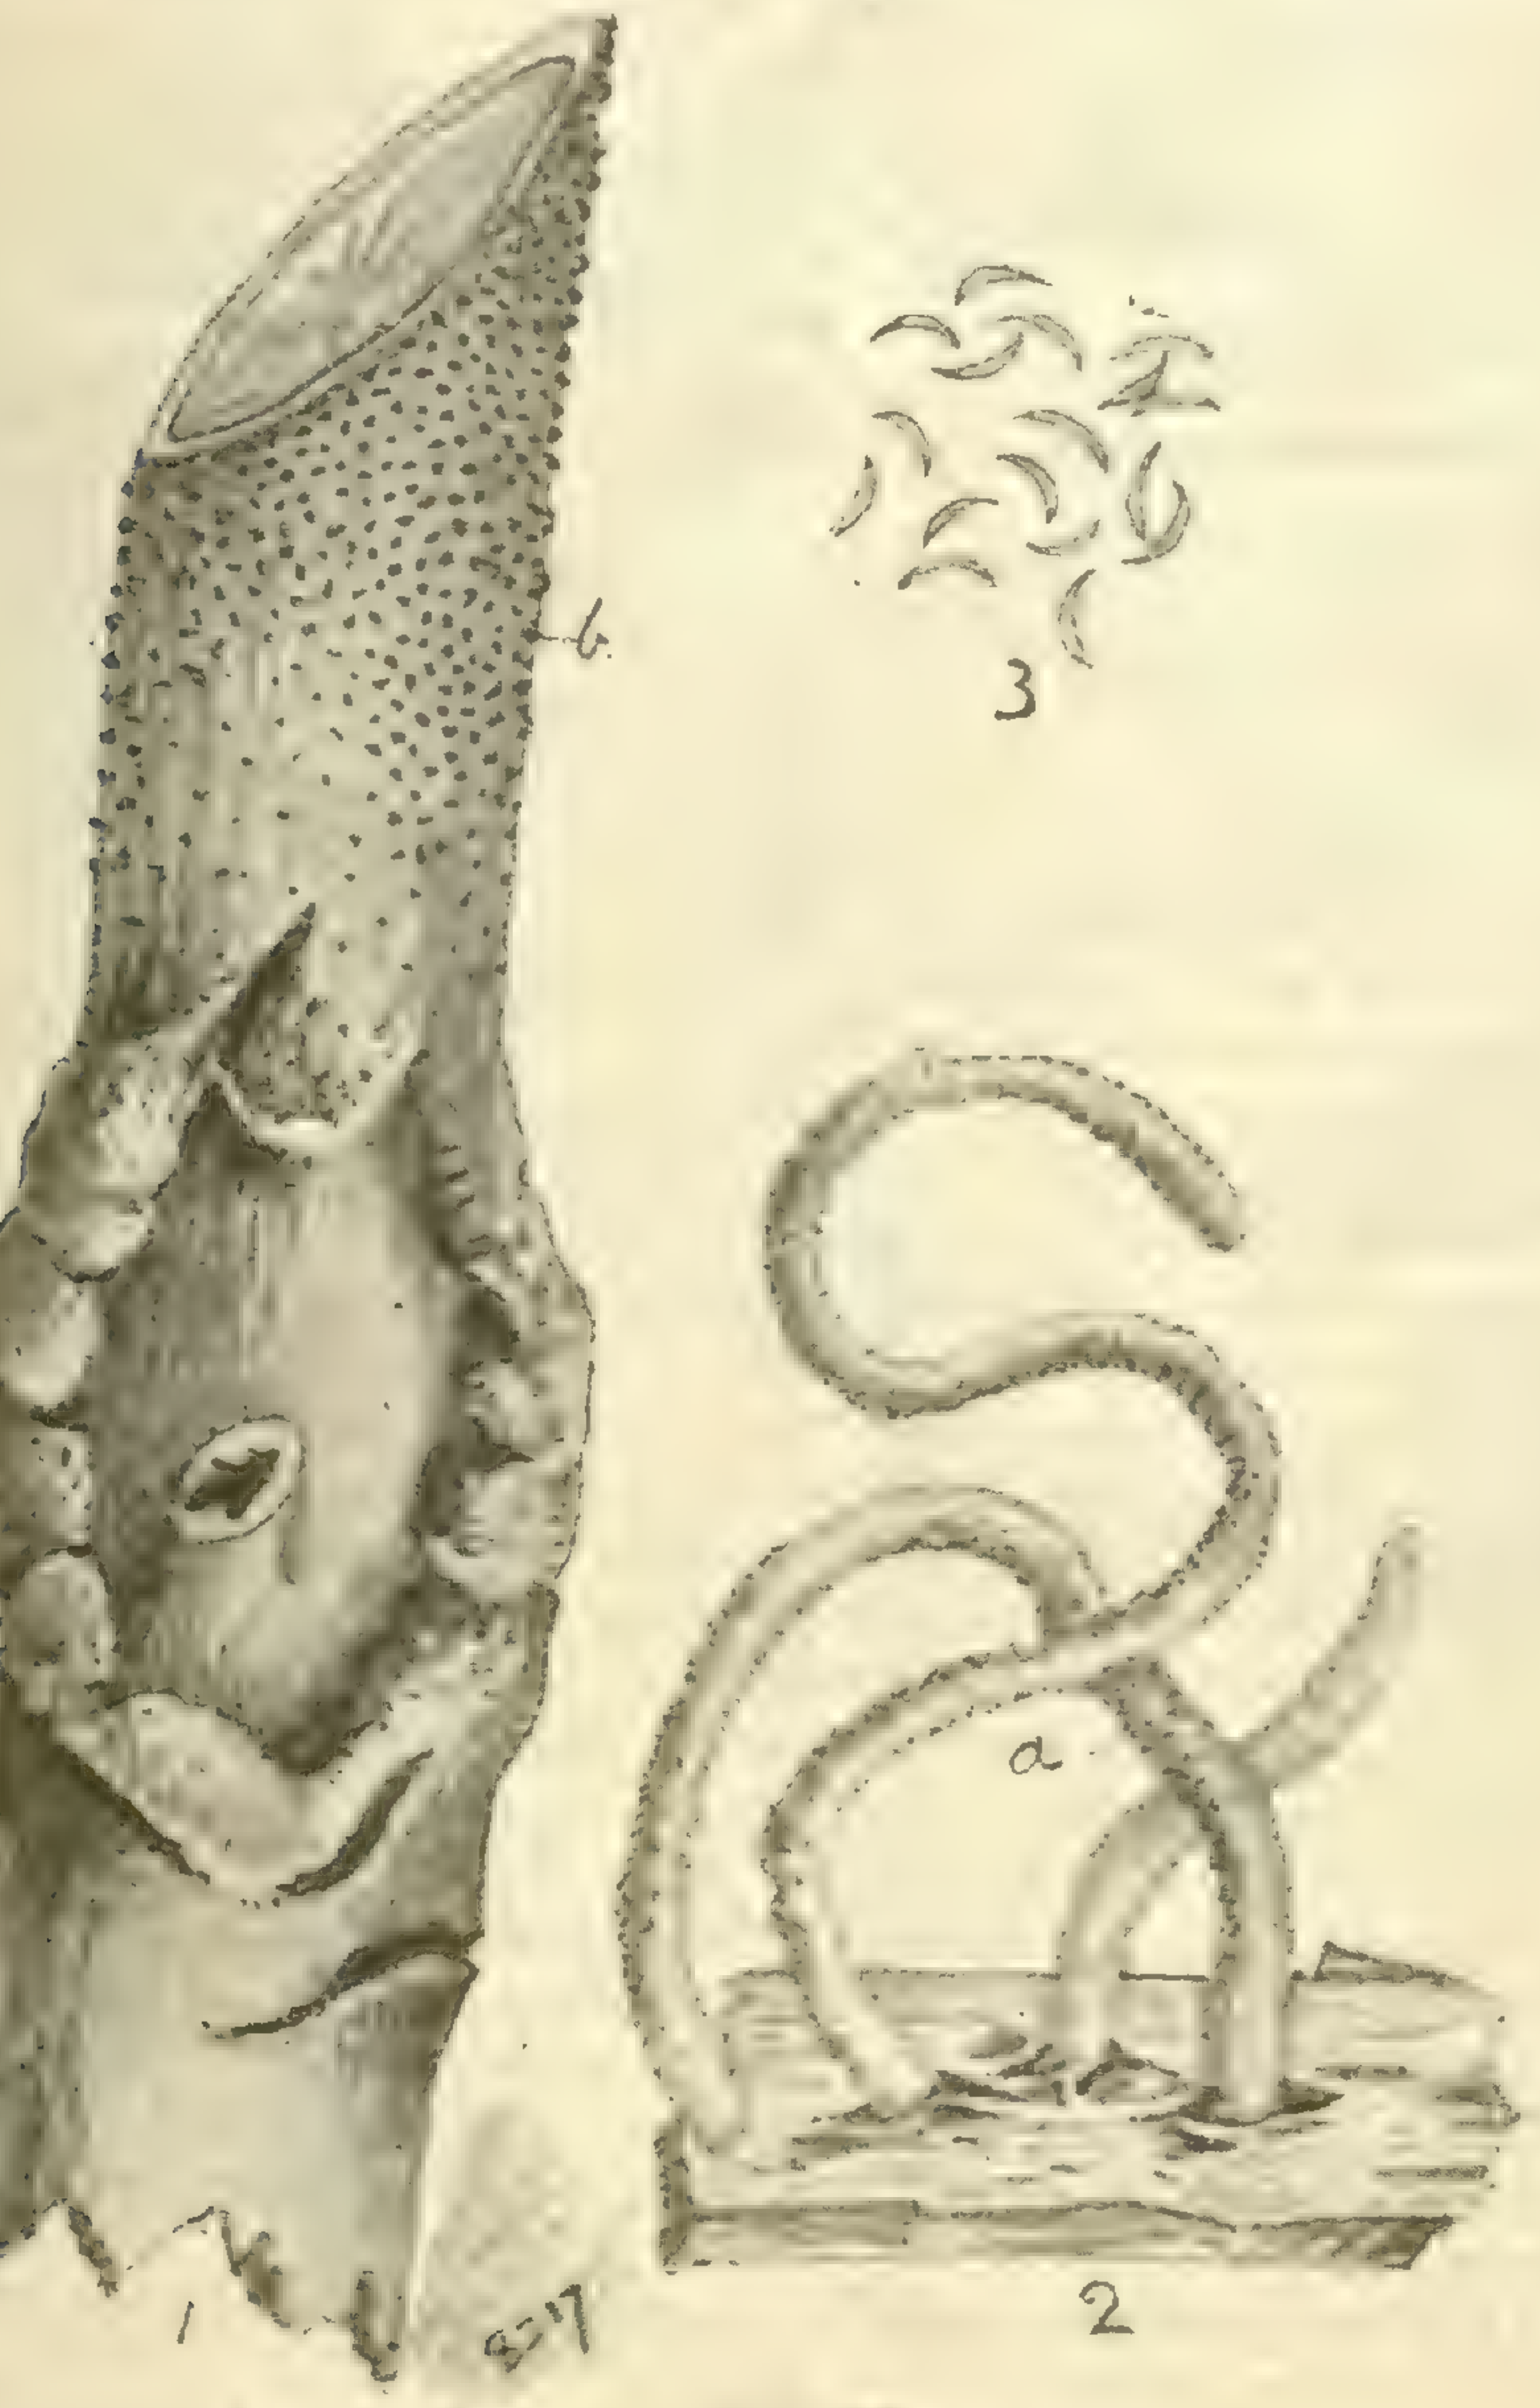
In the *Bot. Mag.*, t. 6,053, we have a figure of an exceptionally showy species—H. Baudouini, a native of New Caledonia. This was flowered at Glasnevin by Dr. Moore, who received seeds from his brother at the Sydney Botanic Garden. It is described as a glabrous shrub, with the leaves crowded towards the apex, and with racemes of flowers a foot in length. This species, it is to be hoped, may become more common in our gardens. Several other species have been in cultivation and figured at various times, though the foregoing are those best known and of value as decorative plants.

Edinburgh. R. L. HARROW.

A FIG TREE DISEASE.

A DISEASE, presumably of old standing, has of late years proved very injurious to fig trees, and one remarkable feature in connection with this disease is the fact that it is most prevalent and destructive in those cases where the trees have received the greatest amount of attention, pruning more especially favouring its extension. The most usual symptoms of its presence are a cankered or ulcerated appearance of the bark, which frequently becomes eaten away in large patches, or variously cracked. In the majority of cases it is very evident that the canker first starts at a point where a branch has been cut away or accidentally broken off, and in all instances it appears that a broken surface of the bark is absolutely necessary to enable the fungus causing the disease to gain a foothold. The mycelium of the fungus spreads rapidly at first in the cambium, or actively growing zone just within the bark, the result being that the bark, as already stated, becomes variously cracked, and eventually entirely disappears, leaving patches of naked wood. During the first stage of the attack the mycelium of the parasite devotes all its energies to destroying the bark, and does not form fruit so long as it remains as a parasite in the living tissues of the branch. This condition of things appears in some instances to be continued for several years, in fact, until the branch is more or less completely girdled, and often presenting a very rugged and cankered appearance.

The destruction of the bark caused the death of the branch above the first point of attack, and when this has taken place, the mycelium follows the dead branch, and produces results of a very different nature to what it did in the living tissues during its first period of attack. The dead bark, replete with mycelium, remains at first perfectly smooth and unbroken, somewhat polished, and of a brown colour. Finally, the fruit of the fungus, which is formed in minute pustules below the dead epidermis, bursts through to the surface, the exceedingly minute spores, only about 1-3,000th of an inch in length, oozing out through minute cracks in the epidermis under the form of very slender, white, gelatinous threads or tendrils, giving to the surface of the dead branch the appearance of being more or less thickly covered with curly white hairs. These minute, white, hair-like bodies are composed entirely of the minute spores mentioned above, and are held together by a viscid substance, which becomes rigid and brittle in dry weather, and are thus easily broken off and scattered by birds or insects, and dispersed. On the other hand, the threads are completely dissolved by dew or rain, and washed down the branches or carried by the feet of birds, insects, &c., to other parts of the tree, and those that happen to be deposited on a wounded surface, germinate, enter the tissues through the wound, and produce a new canker spot.



DISEASED BRANCH OF FIG TREE.

FIG. 1.—Portion of a fig branch attacked by the *Libertella.* The disease entered at the end of the cut branch, near *a*, round which the bark has been completely destroyed. At *b*, the fungus is shown in fruit, natural size.

FIG. 2.—A portion of the surface of the bark from *b* in Fig. 1 magnified; *a* shows four curled threads consisting of myriads of spores stuck together: × 50.

FIG. 3.—Free spores: × 500.

Experiments conducted on healthy young fig trees show that the spores of the fungus—a species of Libertella—will not cause the disease when placed on the unbroken surface or even very young branches, whereas, when the spores are placed on the end of a cut branch or on injured bark, inocculation always followed, and the mycelium was found in abundance at the expiration of ten days. In one experiment, a badly diseased branch, showing numerous threads of spores, was cut through; immediately afterwards the same knife was used for making an incision in the bark of a branch of a healthy young plant of Ficus religiosa. At the expiration of ten days the wound showed undoubted symptoms of disease and at the end of five weeks the white threads of spores were formed. This experiment proves that the disease may be imparted to healthy plants by using a knife that had previously been used for pruning diseased plants, and an examination of various diseased plants suggests the idea that this method of spreading the disease is not an unusual one.

With regard to preventive measures, there is no evidence to show that the mycelium of the fungus extends backwards below the point of infection; hence, when a canker spot appears, the removal of the branch below the diseased spot should be effected at once, as the upper portion of the branch is certain to be killed by the fungus. Every cut surface should be painted at once with a solution of sulphate of copper dissolved in water, and afterwards with tar. It would be wise, when cutting diseased plants, to dip the knife in a solution of sulphate of copper after each cut, remembering that the minute spores adhere to the knife. Burn all diseased branches. When the canker appears on thick branches which it is not desirable to remove, cut away the diseased patches down to the wood, paint the wound with sulphate of copper solution, and afterwards with tar.

It is highly probable that if every cut surface is instantly protected as suggested, the disease would be held in check. Out of the many diseased fig trees examined, no method of prevention appears to have been tried.

GEORGE MASSEE.

TEA ROSES FOR MARKET.

THERE is no question but that tea and hybrid tea roses, together with some of the noisettes, are yearly becoming more popular among buyers and consequently more extensively grown for supplying the market than formerly. Fine form, fragrance, good size and substance, and long stems, are now the chief desiderata, so we have to provide flowers accordingly, indeed I have long since found that it pays best to grow and market only roses of the highest quality, this again proving, in a marked manner, how much the public taste and appreciation of what is good in horticulture has increased. With regard to the cultivation of tea roses for market, little, if anything, further can be added to what I have already stated in these columns. The secret, or secrets of success, are no secrets in these days; to be successful one must do everything that is necessary to the promotion of clean vigorous growth, and full, substantial blooms. Experience has long since shown that cleanliness is a great point in the successful cultivation of good market roses, and tea or noisette roses especially. The houses, either span or lean-to, the former for preference, should be kept clean, not merely the paths, so as to present a tidy appearance when the door is opened, but the stages, walls, glass, and the pots also, for such strict cleanliness tends very considerably to reduce the possibility of insect and other attacks, which the rose grower dreads. Use eight-inch pots, as the general size, allowing a slight increase or decrease for certain varieties, according as they prove more or less vigorous with the grower. Good loam always pays. In the matter of watering, great care is necessary for some little time after potting, but when thoroughly well rooted considerable quantities of water, and regular supplies of liquid manure later, will be necessary. As a fertiliser we use liquid manure made from sheep droppings, alternating this with clear soot water and an occasional dose of either Clay's or Thomson's chemical manures.

However careful one may be, there are almost sure to be some attacks upon the roses either by insects or fungi pests, and when these do occur the attacks must be repelled at once and no quarter allowed. By maintaining a constant and careful watch, green fly or mildew are noticed directly they appear, and as soon as noticed measures are taken to oust them, in the former case by syringing with the handiest good insecticide, and in the latter by painting the hot water pipes with sulphur. Fumigation is frequent and regular, so that we have little difficulty in turning out unwelcome guests. Individual plants are dusted with sulphur or syringed with insecticide as the case needs, and so we reduce the possibility of anything like a bad attack to a minimum. Of course, with the earlier batches of roses for market, the utmost care is necessary in the matter of ventilation, for nothing produces mildew so quickly and badly as cold draughts. In this connection it is also desirable to remember that old or faulty houses often afford opportunities for mildew attack, consequently, during the summer, when there are no market roses growing under glass, it pays to examine the structures, execute any necessary repairs, or remedy any faults as regards position and construction of ventilators, doors, etc.

Now as to varieties; taking them in alphabetical order, it is found that the best tea-scented roses for market are Anna Olivier, Bridesmaid, Catherine Mermet, Climbing Niphetos, Climbing Perle des Jardins, Hon. E. Gifford, Mdme. Chedane Guinoisseau, Mdme. Charles, Mdme. Perney, Mdme. Falcot, Mdme. Hoste, Niphetos, Rubens, Safrano, Souvenir d'un Ami, Souvenir de S. A. Prince, and The Bride. For the purpose of this note hybrid teas may well be included; the best of these are Caroline Testout, Lady Mary Fitzwilliam, La France, Mrs. W. J. Grant, and Vicomtesse Folkestone. We also find that three of the climbing noisette roses are eminently suitable for marketing in first-rate condition, and these are the floriferous sulphur white Lamarque; the bright golden Maréchal Niel; and the ever-charming orange-tinted William Allen Richardson.

GEORGE MOUNT.

Canterbury.

LILIUM RUBELLUM.

YET once again Japan has been drawn upon for a new plant, and that a hardy one of great beauty; this is Lilium rubellum, a distinct and new species recently brought prominently before the public by Messrs. R. Wallace and Co., Colchester. This fine new lily more closely resembles L. japonicum (L. Krameri) than any other we know; it grows about eighteen inches high, is slender in habit, though robust enough in constitution, as has been proved during the past two years at the Messrs. Wallace's nurseries at Kilnfield, Colchester. The leafage is deep green, and each stem carries about a score of lanceolate or linear-lanceolate leaves, each about three inches long. The flowers are broadly funnel shaped, about three inches wide at the mouth, and three inches long in the tube; the colour, or rather the shade, varies somewhat, for some blooms are pale pink or rosy blush, and others quite a deep rose shade, with flushes of red. The lilium is an extremely handsome one, and very small bulbs will produce a flower, while those of larger size and greater age carry from two to four elegant blooms. The species was imported from Japan by Messrs. Bunting and Son, of Colchester, but the stock was secured by Messrs. R. Wallace and Co., who are now offering it to the public, and have exhibited some hundreds of spikes this year at the Temple, Drill Hall, and several provincial exhibitions, where it has always been greatly admired. The horticultural hall mark has been attached to this new lily, for at the R.H.S. exhibition held at the Inner Temple Gardens in May last a first-class certificate was awarded it.

HARDY NYMPHÆAS.

IN the small lake on the lawn in front of Gunnersbury House some fine specimens of these useful plants may now be seen in flower, and an inspection will readily give one some idea of their usefulness. The great beauty of the flowers for table and house decoration is also evident. In reply to my query Mr. Hudson informed me that blooms cut from these plants will remain fresh and presentable for two and three days in a London mansion, and as that is the full limit of good condition for most flowers that are used for such purposes, and even longer than can be depended upon with many, it will be conceded that in these lovely water lilies we have beauty, distinctness, and durability. It is often the case that house decoration in one establishment is very much of a repetition, consequently any distinct departure is much appreciated, and doubly welcome. If, however, hardy water lilies are just grown to add interest to the garden, in making the lakes and ponds ornamental and beautiful, they will have served a good purpose.

When in Gunnersbury House gardens a few days ago I made a note of several hardy nymphæas, some of recent introduction, and as yet seldom seen, whilst others were of much older date, and not by any means rare. Before passing on to the lake my attention was arrested by a small tank outside one of the houses, in which the hot water pipes, just a flow and return, were fixed, so that the water might be a little warmed; there was no covering over the tank, but this slight heating made the water just sufficiently warm for one species that certainly responded to this liberal treatment. This was N. stellata, a species that pushes up flowers of a bright blue colour that stand nearly a foot above the surface of the water. To have succeeded in finding out just the treatment this one requires, and to find the plant respond so freely and vigorously to the culture, is surely cause for satisfaction, and inducement to still further experiments. In the larger piece of water there were grand clumps, some of which had been in their present position for many years, others but just a year or two. When during intense frost the surface of the lake is covered with thick, bearing ice, Mr. Hudson cuts down some of the rushes adjoining and scatters the stems and leaves over the nymphæas, so that the intensity of the frost may not strike too deeply and affect the roots or stems. This is a simple means, and well worthy of adoption where choice aquatics are grown.

Noting the plants as we passed them, the first was N. Laydekeri lilacea, pale carmine, with stamens of bright orange; N. alba, large masses of the old well-known species; N. alba rosea, the very rare variety of the preceding, and of a rosy-pink colour; N. lucida, soft vermilion-red, clear, and very large; N. Marliacea chromatella, beautiful clear yellow, with bright orange stamens, very sweetly scented, and a continuous bloomer, having large flowers; and N. Marliacea, rubro-punctata mauve-purple spotted with carmine, also a large flower. N. sanguinea has intensely dark carmine flowers, very distinct; N. odorata rubra, flowers of a dark rosy-pink, sweetly scented, as its name implies; N. Marliacea albida, pearly white flowers, very large and fragrant, a strong grower; N. gloriosa, rich carmine purple; N. odorata sulphurea, very large yellow flowers nine inches across, fragrant; N. o. exquisita, cup-shaped flowers, broad petals, which are of a deep rose-carmine; N. Marliacea rosea, deep flush pink; N. Marliacea carnea, with delicate pink flowers of great size and sweetly scented; N. pygmæa helveola, small flowers of a bright sulphur yellow; and N. pygmæa, pure white, small flowers, and very fragrant. Yet another I noticed, N. Seignourette, bright yellow tinted with carmine.

Such lovely additions to the gardens will, I trust, commend themselves to all who have the place to grow them, and then even ponds and lakes will have an interest, and afford a pleasure equal to parts of the garden specially cultivated. Let the water be but from two to three feet deep, if just slightly moving so much the better, the plants put in baskets or pots and stood in the water; or, if by any means good heaps of soil could be made just inside the margin of the water, and the plants put on them, they will soon become established and grow freely, and once established little further than protection during the coldest season will be necessary. Plants even now may be planted, though the months of May and June are the best for this operation.

W. SWAN.

EXPERIMENTS WITH POTATOS.

THE Department of Agriculture of the Province of Ontario has carried out many very elaborate and useful experiments with potatos during the past seven years, from which the following has been selected. A total of 195 varieties have been experimented with.

DIFFERENT DEPTHS OF PLANTING SEED POTATOS.—For six years in succession potatos have been planted one, three, five, and seven inches deep. There has been no less than eighteen separate tests, and seventy-two plots used in this experiment

Depth of planting.	Average yield per acre. Six years.
One inch...	192·7 bushels.
Three inches	198·4 ,,
Five inches	203·7 ,,
Seven inches	190·4 ,,

It will be observed that the greatest yield has been obtained at a depth of five inches, and those planted three inches deep stand second in the yield per acre. In seasons of drought it has been found that potatos planted near the surface suffer severely from lack of moisture. It is also of interest to note that the crop of tubers produced from the deepest planting was nearly five inches under the surface of the soil when the crop was matured, while those produced from the seed of the shallowest planting was less than two inches below the surface. While it is objectionable to grow potatos too deep in the soil, and thus cause greater labour at the time of harvesting, it is not desirable to grow them too near the surface, as many of them are liable to be injured by exposure to the direct rays of the sun. The planting of five inches below the surface has given very satisfactory results throughout.

DIFFERENT METHODS OF PREPARING SEED.—An experiment has been conducted for five years in succession by preparing seed potatos for planting in different ways, in order to find out which methods will give the best satisfaction. The quantity of seed per acre varied according to the manner of preparing the seed. The rows of potatos in each case were about twenty-seven inches apart.

Preparation of Seed.	Average Yield per Acre, Five years.	Per cent of Marketable Potatos.
Large, whole, one foot apart ...	336·7 bushels	79·9
Large, whole, two feet apart ...	247·4 ,,	84·6
Large, whole, three feet apart...	199·6 ,,	87·2
Medium, whole, one foot apart	271·0 ,,	83·0
Medium, whole, two feet apart	210·9 ,,	88·4
Small, whole, one foot apart ...	197·6 ,,	88·5
Medium, cut in two, one foot apart ...	198·5 ,,	84·1
Medium, two eyes in a piece, without seed ends, one foot apart ...	143·9 ,,	91·5
Medium, one eye in a piece, without seed ends, one foot apart ...	91·7 ,,	92·3
Medium, seed ends, one foot apart ...	95·6 ,,	87·3

These results furnish some important data in reference to the preparation of potatos for planting. It will be observed that decidedly the best yield per acre has been produced by large potatos, one foot apart; and the second largest yield from medium-sized whole potatos one foot apart. In the percentage of marketable potatos it will be seen that the pieces of tubers containing two eyes each, obtained from medium-sized potatos, gave the best satisfaction in this respect. The largest amount of small potatos was produced from the large whole tubers, which were planted one foot apart.

INFLUENCE OF GYPSUM AND LIME WHEN SPRINKLED ON FRESHLY-CUT POTATOS.—In order to obtain data which would form a serviceable guide in regard to sprinkling freshly-cut pieces of potato for seed before planting, an experiment was started in 1894, and was conducted for three years in succession, in which freshly-cut potatos have been sprinkled with gypsum or with lime, or have been left untreated before planting.

To get as accurate a result as possible, two varieties of potato were used for each experiment each year:

Preparation of Sets.	Average yield per acre, three years.
Potatos sprinkled with gypsum	251·4 bushels.
,, ,, ,, lime ...	243 4 ,,
,, not sprinkled ...	208·6 ,,

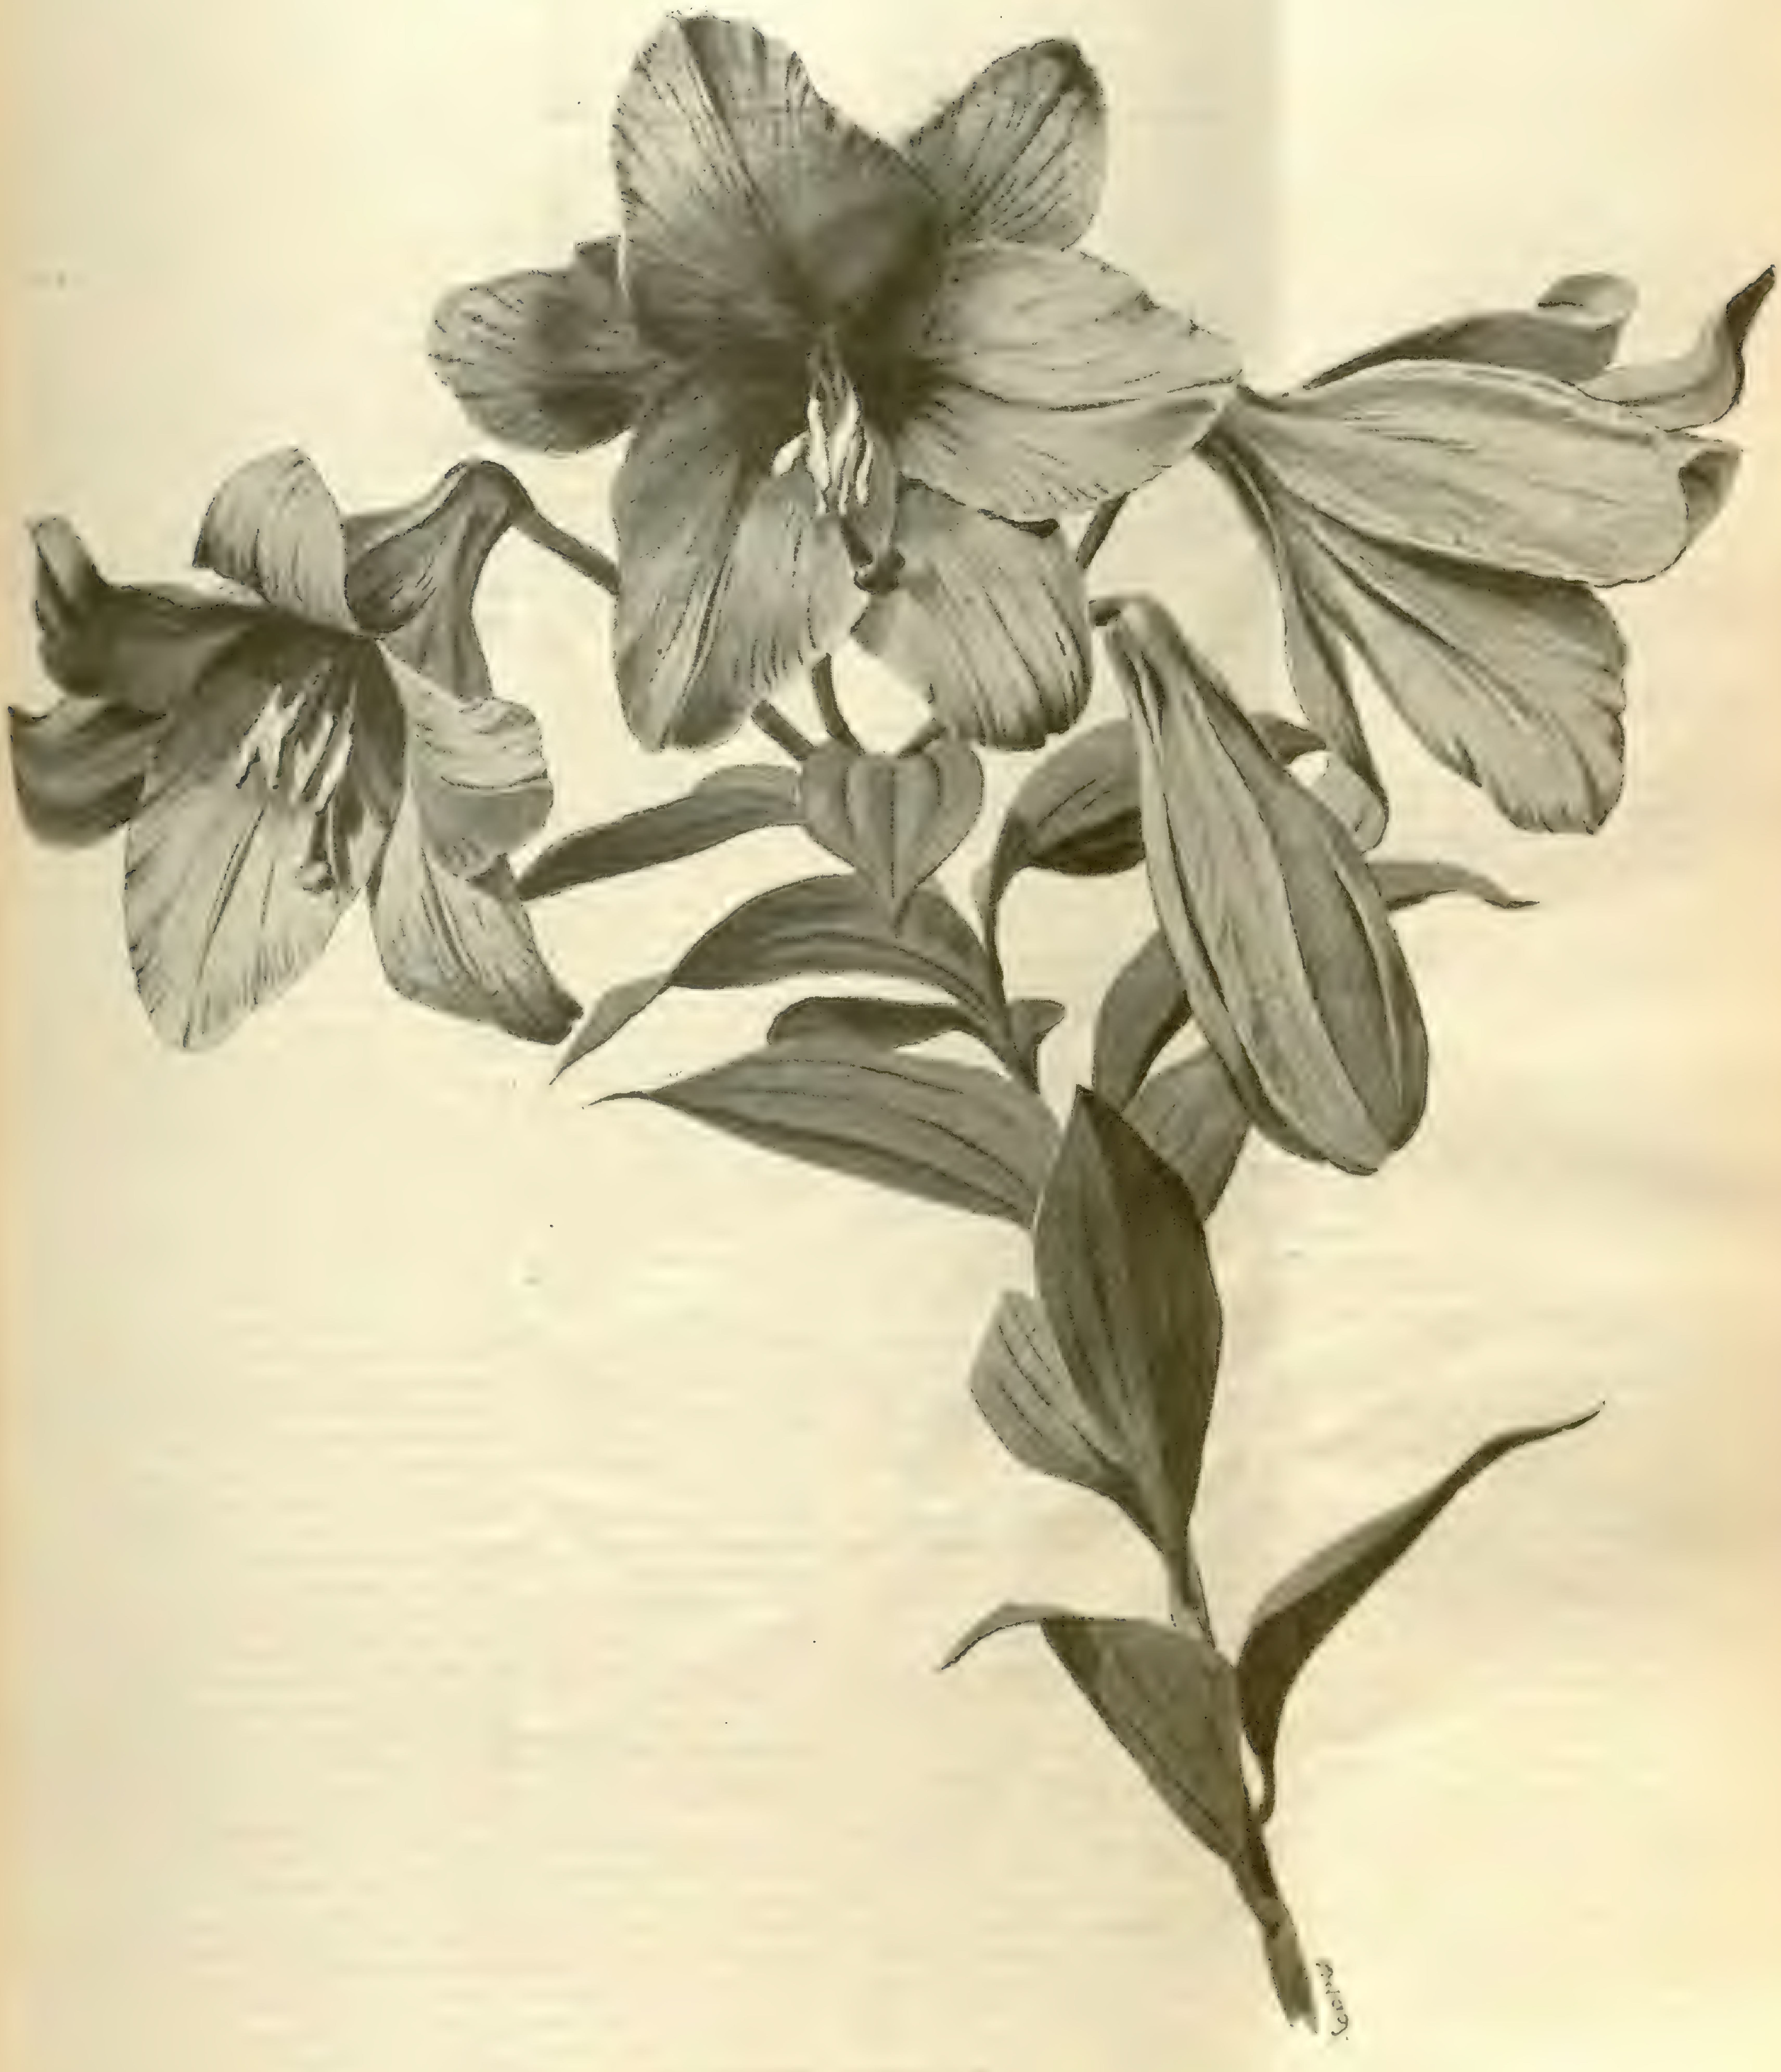
The yield per acre was quite uniform in the three years of the experiment.

The potatos sprinkled with gypsum (plaster of Paris) gave the best results, and those sprinkled with lime gave the second highest yield. It will be observed that, in the average yield of potatos per acre, the seed dressed with gypsum gave about 43 bushels per acre, and the seed dressed with lime about 35 bushels per acre more than the seed which was untreated.

Seed potatos treated in this way are less liable to be attacked by injurious insects in the soil, than those having a freshly-cut surface exposed.

Harpenden. J. J. WILLIS.

Watering Vines and Ventilation.—After a cold, wet, dull May, the first few bright days of June were very trying to the vines. The foliage often suffers under such conditions, and, if so, it is the precursor of red spider; so a good soaking of the border, with early air-giving, is very necessary. Scalding of berries cannot well be avoided with young vines, because the sunshine reaches the berries direct between the scanty foliage. It has been difficult to give the necessary root-waterings, because of the changeable weather, as with large vineries having saturated borders at a time when there are low night temperatures, mildew is bound to follow. Bright continuous sunshine will work marvels, but we must be satisfied that vine borders, especially inside ones, are well watered. In extreme cases of foliage being distressed by hot weather following cold, give a thorough drenching of the foliage, as the grapes, if green, will be none the worse for clean water.—STEPHEN CASTLE, F.R.H.S., *Bottesford Vineries, Notts.*



LILIUM RUBELLUM.

WORK FOR THE WEEK.

COOL ORCHIDS.

ONCIDIUM PHALÆNOPSIS, O. cucullatum, O. nubigenum, O. cristatum, O. dasytyle, and O. concolor will now require a little fresh material about their roots, the usual peat and sphagnum compost sufficing over good drainage. The first three species are best grown in pots stood upon a stage in the most shady position, while the others grow much better in pans or baskets suspended close up to the roof glass. O. metallicum should also have a little fresh material, as it will soon be emitting new roots from the base of the young growths; the long rambling flower spikes make their appearance in the partially-developed growths, and should be trained round some neat stakes or on a wire just below the roof. All these plants will need a plentiful supply of water during their season of growth. Any plants of Maxillaria Sanderiana or M. Turneri that require repotting or resurfacing should now be attended to, using a compost of three parts sphagnum to one of peat; the former species is best grown in teak wood baskets, using no crocks for drainage, as it frequently thrusts its flower spikes through the soil in a downward direction. M. Turneri will grow well in an ordinary flower pot or pan three parts filled with drainage, and should be potted firmly. Care should be taken in the watering of the newly-potted plants, giving only sufficient to keep the moss alive until the new roots obtain a good hold of the compost. One of the best-known species of maxillarias is M. tenuifolia, which first flowered in this country as long ago as 1839; it may be grown successfully if fixed to pieces of tree fern and stood in an upright position in a flower pot; the plants will need a liberal supply of water during the growing season.

The sweet-scented Cattleya citrina is totally unlike any other species of cattleya in growth and habit, the pseudo-bulbs, foliage, and flowers always drooping towards the ground. Unfortunately, it is a species that deteriorates after a few years' existence in our glasshouses, although some growers manage to keep it in a good condition for a longer time than others. The best method to grow these plants is on blocks of wood or teakwood rafts, with a little sphagnum moss pricked in about the roots to help hold the moisture; the cool house will be found the most suitable place for the specimens, suspending them close up to the roof glass in a light position. After a good rest, following flowering, root-action and new growth are now commencing, therefore a more liberal supply of water will be needed, the block and plant being frequently immersed in the water-tank, and, if the weather is very dry and hot, this should be done every evening. Disa grandiflora has its flower-spikes now well advanced, and, as these are liable to be infested with green-fly, steps must be taken to destroy the aphis as soon as they are detected by means of the brush and sponge, afterwards syringing the plants with soft water till quite clean, otherwise much harm will be done. Water must still be freely given till the plants pass out of flower, when the quantity must be gradually reduced.—E. SHILL, *New Hall Hey Gardens.*

STOVE PLANTS.

THE present is a suitable time for inserting cuttings of ixoras and gardenias; choose moderately firm short-jointed shoots and insert singly into two and a half-inch pots, and place where they will have the assistance of a bottom heat of about 80 degrees; keep the soil uniformly moist with plenty of moisture in the atmosphere, and they will soon form roots; after rooting, stand in the body of the house for a week or so, when they may be put into five-inch pots. Before inserting the cuttings examine them carefully to see they are perfectly free from insect pests. Late-struck plants of justicias in three-inch pots should be transferred to others six-inch in diameter; keep close until they have established themselves in their pots, when they may be grown cool; treat liberally, and encourage them to form huge heads of flower. Plants of Clerodendron Balfourianum, as they go out of flower, should have the old flower trusses removed and receive any pruning necessary, and be afterwards encouraged to make a free growth, as next season's supply of flowers depends upon the growth made this year and on having this well ripened. Train the shoots up strings, and keep them from interlacing; feed the plants liberally. Any requiring larger pots may be repotted when the new growths have made about three inches of growth. Pot on young plants of crotons, acalypha, dracænas, and other things. Shift any it is desired to grow to a large size before the roots become too matted in the pots; this is the main secret in growing plants to a large size in a short time. The winter-flowering begonias are growing freely; they should receive liberal treatment, shade from strong sunlight, and afford abundance of air both day and night; by this treatment they will be found to give better returns than under a more coddling system of growth. Well-ripened shoots of Cissus discolor may now be propagated; cut the shoots into lengths consisting of two joints; do not keep the cuttings too close, or damping may occur. Ferns will require abundance of water, and must on no account be allowed to suffer for the want of it, else the beauty of the plants will be soon marred; should green fly make its appearance amongst them, fumigate lightly two or three nights in succession with X L All fumigating compounds. With all fumigating compounds little and often is better than one strong dose, which is liable to injure the plants besides destroying the insect pests. Be careful in watering all basket plants that the whole body of the soil is thoroughly moistened; failure with these can often be traced to lack of the above precaution.

The plants in the stove should be periodically rearranged, some grow so much more freely than others that parts of the house present a crowded overgrown appearance, unless an occasional rearrangement is resorted to. Nor is this the only reason to be offered in support of the plea for rearranging now and again, but the very fact of the same plants standing in the same position all the season through has a tendency to make the house monotonous to those who pass through it daily. Ladies have a happy habit of changing the appearance of their boudoir or drawing-room by altering the position of the furniture—so gardeners also may make their houses more interesting by occasionally altering the arrangement. Plants of Urceolina pendula aurea having now completed their growth may be removed to a cooler and more airy structure to ripen off. Do not withhold water until the leaves are quite matured and then do so gradually. Wage a constant war upon all insect pests; plants, like human beings, thrive better when thoroughly clean. When sponging leaves of anthuriums, eucharis, &c., be careful not to break them, as leaves with a broken midrib have a rather unsightly appearance. Keep the atmosphere of the house thoroughly moist, with a little warmth in the pipes, even in the hottest weather.—J. TUNNINGTON, *Ripley Castle Gardens, Yorks.*

KITCHEN GARDEN.

ALTHOUGH cucumbers are not so much in demand during the winter as during the warm weather, still in most places a few are required, and to have the plants in good condition for carrying a crop they must be brought on gradually. The seed should therefore now be sown, and when the seedlings appear they should be kept near the glass to prevent them becoming drawn, for unless sturdy when planted there is little hope of success afterwards. Most gardeners have fancies of their own as to varieties, but it is generally admitted that the small-growing kinds of the Telegraph section are the best. Preparations should also be made for a supply of mint and tarragon for forcing. Cuttings of these are inserted in boxes, which should afterwards be stood in a cold frame and shaded from the sun till roots have formed, after which they may be exposed. Plants so raised may stand in the boxes until required for placing in the forcing-house, and will be found to give a greater supply of young growths than those lifted from the open ground. Vegetables of various kinds are very plentiful this season. Globe artichokes have seldom been so good, and those who have taken the precaution to make a young plantation as advised in the spring will have an abundance of fine heads for some time to come. It is the custom with some to cut down the old flower stalks and blanch the leaf stems in the same manner as cardoons. Those who contemplate doing so should tie the foliage together and exclude the light, but while there are so many choice vegetables to select from we scarcely think there is necessity for this. Peas from the last sowing will now require staking, and they should not by any means be neglected in the way of watering, for if mildew once shows itself there is little hope of getting a full crop. French beans for late use should now be sown in a cold frame, but the lights should not be put on until there is danger of frost. The plants ought to be allowed ample space or they will not fruit satisfactorily during dull weather later on. Some seasons the autumns are mild, and beans may be gathered from the open ground till quite late in the autumn, but this is not always the case, therefore preparations should be made accordingly. Mushrooms may now be gathered from beds in the open, and a supply from these may be continued till late in the season if care be taken to have beds made so as to follow each other in succession, but to obtain the finest results there must be no neglect in the way of keeping the beds dry till wanted. Onions intended for exhibition will require frequent watering during dry weather, and should there be any signs of mildew dust the plants when damp with newly slacked lime, as it is of the utmost importance that the foliage be kept clean. Attend to the watering of all newly planted seeds, not simply sprinkling the surface, but give it in sufficient quantity to thoroughly moisten the ground. Asparagus beds will be greatly benefited now by an application of liquid manure to assist them in completing their growth, or failing this, a liberal dressing of artificial manure. The same remarks apply to such plants as celery, cauliflowers, French beans, &c.—H. C. PRINSEP, *Buxted Park Gardens.*

FRUITS UNDER GLASS.

ORCHARD-HOUSE pot trees should be repotted, if thought necessary, as soon as they are cleared of fruit; but frequent pottings of these trees is a mistake, as they will continue to produce good fruits for several years in the same pots, provided they are supplied with a good staple to begin with and have had the usual routine of rich top dressings and liquid manure to assist in promoting fat fruit buds and good foliage; still, a time comes when potting must be done, and, as is the case with planting outdoor trees, it is best to repot early enough to enable the roots to penetrate the new soil before winter sets in. Small shifts are the best, and the drainage must be carefully arranged so that it does its work well without being too ample, or taking up too much valuable space. The soil used should be the turfy layer from heavy pasture land, and should be in a semi-decayed state, so that it may be pulled to pieces without much assistance from the chopper. About one-sixth of lime rubble will provide for sufficient lime, and will at the same time keep the soil sufficiently open; in addition to this, a slight sprinkling of bone meal will add a necessary food element. Pot firmly, and allow no crevices between the layers of soil, also see that the ball of soil is kept at the right height so that there will be room left for watering; and, on the other hand, see that the collar of the tree is not too deeply buried. Where the original soil is at all sour or stagnant, it will be necessary to remove some of it from around the ball, but not to the extent of damaging living roots; in other cases, with plenty of living roots throughout the ball, no disturbance should take place, simply keeping the balls of soil intact. After potting, keep the trees under glass for a few days, or until flagging ceases, reducing the ventilation slightly and syringing freely two or three times a day, but giving no water to the roots for a time. When the trees will bear it, these and all others cleared of fruits, but not repotted, should be stood outside in a sunny spot, the pots surrounded, and covered with a mulching of litter, and here they may remain to perfect and ripen their growth, all the further attention they will require being to keep the roots in good condition as to watering, and syringing the trees thoroughly daily.

Young pot vines which have been grown on for early supplies next year will also be well suited from now onward with a position outside; but in their case it will be necessary to afford all possible ripening influences by fastening them securely to a sunny wall where they may also enjoy sufficient shelter to preserve the main leaves intact as long as possible. Various pests, in addition to the ordinary run of injurious insects, will soon be troublesome. Wasps as yet are not much in evidence, but it is well to be on the alert for them, and I find nothing for use indoors so satisfactory as Davis's or Scott's Wasp Destroyer, either of which are quite effective. Muddling up the ventilators with hexagon netting, or enclosing bunches of grapes, &c., in muslin bags, are clumsy and unnecessary practices while we have such good preventives as those named above. For destruction of the nests cyanide of potassium, poured on pieces of linen rag and pushed well into the nests (being careful to push them out of sight and reach, as the cyanide is a deadly poison), is most effective and less trouble than any other material used for the purpose. Field mice and the short-tailed field vole are very destructive to stone fruits at times, and are difficult to bait for while other food more to their taste awaits them, but they may be trapped by putting down lengths of three-inch draining tiles on the surface in their runs or in other likely places, and setting ordinary small bird gins at one end just outside the tile. Natural inquisitiveness or something else tempts them through the tiles and into the trap which they would avoid but for the tiles leading up to them. Ants seem very plentiful this year, but may be circumvented by pouring hot water, in which a little petroleum has been mixed, down the runs, repeating the dose at frequent intervals until they are stopped. Weevils attacking vines or peaches should be sought for at night after having spread large sheets of white paper under the trees during the day. Go to the house after dark with a lantern, which should be kept dark until the trees are reached, and then turned fully on to the spots which have been the points of attack. The weevils will fall and lie still for a while, and may be easily secured. Paper is better than sheeting for putting under the trees, as the insects can be heard when they drop on it.—J. C. TALLACK, *Livermere Park Gardens.*

Q. WHAT is the only canine horticultural equivalent to the dog-rose? *A.* The colley-flower!—*Punch.*

FLOWER CULTURE IN THE SCILLY ISLES.

Mr. W. E. Bear has been engaged in investigating the flower-growing districts of England, and he has contributed the result of his inquiries to the current issue of the Royal Agricultural Society's Journal. As the report is based upon personal observation, it is of much interest, and we make a few extracts from the section devoted to the production of flowers for market in the Scilly Isles. After describing the situation of the island, and dealing with the statistics relating to the population, Mr. Bear proceeds to state that encircled as the islands are by the Gulf Stream, their climate is remarkably mild and equable, protection to tender crops even in winter being needed only against the frequent gales of wind to which they are subject. Frost rarely occurs, while snow seldom falls, and hardly ever lies on the ground more than twenty-four hours when it comes The rainfall is moderate; and the islanders would be glad of more rain than they get in the spring and summer. The mean daily range of temperature in twenty years is given by Dr. Macklin at 6·8 degrees. October has the lowest range, or 5.9 degrees; April the highest, or 8 degrees. The mean maximum range was 11·5 degrees, November being lowest with 2 degrees, and April highest with 15 degrees. The mean range for the whole year during the twenty years was 15·1 degrees—*i.e.*, the difference between the mean temperatures of the warmest and the coldest month. Taking the six winter months alone, the mean range was only 3·7 degrees. For the six summer months the mean temperature was 57 degrees, and for the six winter months 47 degrees, showing a difference of only 10 degrees. These figures indicate not only a mild, but also a remarkably equable, climate. Dr. Macklin further states that the mean temperature of the Scilly Isles is 1 degree warmer than that of either the West of Cornwall or the Channel Islands.

With respect to sunshine, recorded only during the last ten years, some comparative figures are given for the ten months ending with December 1, 1894, during which 1,551·1 hours' bright sunshine were registered in Scilly, or 155 per month, or 5 per day. The total was exceeded only by Jersey, Guernsey, Newquay, and Falmouth among places in the United Kingdom for which statistics were given. Hastings, Westbourne, Eastbourne, Torquay, places higher on the list, stood lower than Scilly. Ocular demonstration of the mildness of the Scilly climate is to be found in the tropical vegetation which flourishes in the islands.

When the late Mr. Augustus Smith, in 1834, became, mainly from humanitarian motives, Lord Proprietor of the islands (a title given to the lessees holding under the Duchy of Cornwall), they were over-populated, and the people, who mostly lived by smuggling, were in a distressed condition. The sub-division of holdings had been carried on to a disastrous extent, and very many of them consisted of scattered plots of land. Mr. Augustus Smith set himself to the reform of the abuses which he found prevalent. He stopped smuggling, made education compulsory, enlarged and consolidated the small holdings, and allowed only one child in a family to succeed to his father's farm, practically forcing the rest of the youths to migrate to the mainland, to emigrate to the colonies, or to go to sea. Never was a benevolent despotism better justified by results, though it was some years before the islanders became generally prosperous. Steadily, however, Mr. Smith, who spent all the rental of these islands for many years in improvements, trained the people in habits of industry and ultimately of enterprise, until, from being among the poorest small farmers in the United Kingdom, they became the most generally prosperous.

The extent to which the sub-division of holdings had been carried before Mr. Augustus Smith's time may be imagined when it is mentioned that, long after the consolidation had been in progress—namely, in 1870—the sizes of farms in St. Mary's were reported by Messrs. Scott and Rivington to range from five to 15 acres, with the exception of one of 30 acres, which included a large proportion of untilled land. On the other islands, the same writers stated, the farms were still smaller, many covering only three acres, while the largest farm on St. Agnes was [illegible] acres in extent. At the present time the smallest farm in St. Mary's is 10 acres, and the largest is 80 acres, exclusive of some rough grazing land; while the extreme areas are about five to 20 acres in St. Martin's, five to 12 acres in Bryher, and four to 15 acres in St. Agnes, not counting the downs, which the tenants on the last three islands have in common. Bearing in mind the greatly increased returns of the land since 1870, the enlargement of the holdings is significant.

The ordinary farming of the period, chiefly consisting in the growth of small areas of corn and a few potatos, and the keeping of stock on the grass land, was not very profitable; and the first extensively advantageous change which the Lord Proprietor induced the farmers to make was gradually to convert their farms into market gardens for the production of early potatos, asparagus, seakale, and other crops. The earliness of these products rendered them exceptionally profitable, and for many years the Scillonians were prosperous market gardeners of the old kind as producers of culinary vegetables.

In 1870, or a year earlier or later (strangely enough the date of the important event has not been precisely recorded), the father of Mr. Allen, the present steward, packed for the late Mr. Augustus Smith, then Lord Proprietor, a box of narcissi, and sent it to Covent Garden, receiving £1 in return. When this became known, a few of the farmers began quietly to collect bulbs wherever they could find them growing in the fields or hedgerows, and to cultivate them so as to increase stocks, getting a few flowers for market in the meantime.

In 1875, when Mr. Dorrien-Smith took up his residence in Tresco, the demand for flowers was still small, and prices were not tempting enough to induce the Scillonians to grow them upon a large scale. It was not until 1880, about ten years after the few pioneers commenced operations, that the industry became thoroughly remunerative, and even then the production was small.

In 1883 Mr. Dorrien-Smith went to Belgium, Holland, and the Channel Islands to obtain information as to the cultivation of the narcissus. In the Channel Islands he found the people devoted chiefly to the production of grapes, potatos, and other vegetables, and growing very few flowers; while in Belgium and Holland narcissi were a month later in flowering than in Scilly. Hence he concluded that it would be safe to extend the cultivation of these flowers, and he bought bulbs extensively for himself and his tenants. From that time the cultivation of the narcissus rapidly extended, and many new varieties were introduced, very high prices being paid for some of them.

In 1885 the Bulb and Flower Association was founded by Mr. Dorrien-Smith, to promote the growth of the flowers by holding annual shows and otherwise. By that time the exports of flowers from the Scilly Isles had become considerable, amounting to 65 tons in the year, and the quantity increased to 85 tons in 1886, to 100 tons in 1887, to 188 tons in 1888, and to 198 tons in 1889. Exports steadily increased up to 1893, when they reached 448 tons, after which there was a falling-off, but the climax was reached in 1896, when 514 tons were exported.

It is worth while to pause for a moment to consider what 514 tons of flowers represent. The steamship owners roughly allow eight boxes to the cwt., or 160 to the ton, the weight of the boxes being included. According to this calculation, 82,240 boxes of flowers, which in the case of narcissi contained 21 to 51 bunches (of twelve flowers) per box, and in that of anemones 72 bunches, were sent out of the Scilly Isles in 1896. One grower, who appears to have larger boxes than those referred to above, says that he packs 36 to 100 bunches in a box; but the precise accounts kept at Tresco have enabled Mr. T. G. Brown, farm manager to Mr. Dorrien-Smith, to favour me with the statement that the number of bunches of flowers of all kinds averages about 7,000 to the ton of flowers and boxes, and 514 tons would therefore be equivalent to about 3,598,000 bunches.

The extent to which flowers are grown is about 400 acres in St. Mary's, 43 acres in Tresco, 30 in St. Martin's, 15 in St. Agnes, and 15 in Bryher, making about 503 acres altogether, almost all devoted to the narcissi.

A few years ago large quantities of wallflowers and stocks were grown in St. Mary's, the former flowering in February or March, and the latter a little later. But now the quantities of these flowers produced in the Scilly Isles are small. The several varieties of the narcissus make up the bulk of the market flowers, the only others of importance being gladioli, anemones, marguerites, and arum lilies, though a few freesias, Spanish irises, and white pinks, as well as the small quantities of wallflowers and stocks already mentioned, are also grown.

Bulbs have not been exported to any great extent from the Scilly Isles. The newer varieties have been for the most part kept to increase the extent of their cultivation, while the common sorts are worth only 15s. to 30s. a thousand, the buyers, I believe, paying the freight to the various destinations. There is no considerable demand for the bulbs of some of the varieties most extensively grown in the Scilly Isles, and notably the polyanthus varieties, as they are not cultivated for market at all commonly on the mainland.

Mr. G. T. Brown has kindly prepared for me the following list of varieties of the narcissus grown in the Scilly Isles, distinguishing the daffodil and the polyanthus varieties from the others:—

DAFFODILS.

Telamonius (the old double daffodil).
Emperor.
Empress.
Grandis.
Rugilobus.
Princeps.
Obvallaris.

POLYANTHUS VARIETIES.

Scilly White.
Grand Monarque.
Soleil d'Or.
Gloriosus.
Jaune Suprême.
Mozart Orientalis.

OTHER VARIETIES.

Sir Watkin.
Incomparabilis (single).
" (double).
Cynosure.
Stella.
Leedsii varieties.
Frank Miles.
Odorus Major (Campernelli).
Orange Phœnix,
Sulphur Kroon.
Barri Conspicuus.
C. J. Backhouse.
Ornatus (*Poeticus ornatus*).
Poetarum.
Poeticus Plenus (double Pheasant-eye).

The violence of the frequent gales of wind renders shelter for the flowers necessary, and this is provided by fences usually consisting of veronica, escallonia, or euonymus, all three of which flourish in the islands.

Scilly growers have at least three great advantages in the production of bulbous flowers. The first and greatest is earliness of production; the second is suitability of soil and abundance of sunshine for bringing the flowers to a perfection of size and colour; and the third is suitability of soil and climate for promoting a good increase of bulbs. That these natural advantages are partially counteracted by careless cultivation on the part of some of the growers does not, of course, disprove their existence. On the other hand, the growers have two disadvantages—the heavy cost incurred and long time occupied in conveying the flowers to market. The freight from St. Mary's to London is 8s per cwt., and from St. Martin's (and presumably from the other outlying islands) it costs those who do not carry their own produce 1s. 6d. per cwt. extra to convey it to the quay at St. Mary's. Half the freight from St. Mary's to London is swallowed up in steamer freight, quay dues at starting and on reaching Penzance, and cartage to Penzance Station. Bearing in mind the fact that about one-third of the weight on which the freight is paid consists of boxes, it will be seen that this is no slight tax upon the returns; and, in addition, there is a commission of 10 per cent. on the prices realised to pay the salesmen (or 5 per cent. if growers find their own boxes), with other charges, including the cost of returning empties, which are debited to the growers by the salesmen. As to the time occupied in conveyance to market, the steamers run to Penzance only three times a week in the height of the flower season. This by itself is a disadvantage in periods of sunshine, when flowers expand quickly; but it is not all. Flowers loaded on the steamer at St. Mary's on one morning are not in Covent Garden until the next day, when they reach Paddington at 4 a.m. Consequently varieties of flowers which do not travel very well are sometimes in a deteriorated condition when exposed for sale. Nothing, however, entirely counteracts the advantage of early production.

The supply of narcissi from the Scilly Isles begins with a few forced flowers at or before Christmas, while the earliest open-air varieties are usually ready at the beginning of January, occasionally in December, or in very backward seasons at the end of January, and successive varieties are sent to market up to about the end of May. Marguerites flower in the open all the year round; anemones (*Anemone fulgens*) from December to March; wallflowers, as already stated, in February and March; arums, which withstand the winter in the open in Scilly, begin in April or May usually, but this year started in March; scarlet ixias, in May; gladiolus and iris in June, with which month the flower season ends.

While most of the growers who produce any considerable quantity of flowers possess one small unheated glass-house, in which they keep their flowers for a day or two before packing them, the area of hot-houses in the Scilly Isles is not large. Mr. Dorrien-Smith, in Tresco, has by the far the greatest extent, namely, 28,800 square feet covered with glass. In St. Mary's only five farmers have any considerable extent of hot-houses; in St. Martin's only three have even a small extent; in St. Agnes only one; and in Bryher, none.

As the narcissi are picked as far as possible before the blossoms have expanded, a small glass-house is necessary for the proper preparation of the flowers for market. On being brought in from the fields, they are placed in whole-bottomed flower pots containing water, in which they expand, and in some cases the water is warmed. The flowers expand better than they would in the fields, and travel better for being kept in water a short time, though this process is often overdone. Most of the hot-houses are used for forcing narcissi first, and for tomatos afterwards. The extent to which tomatos are produced in Scilly will be referred to in a subsequent division of this report. The narcissus is the only flower forced, I believe, and the quantity thus treated cannot be very great. The varieties used for forcing by Mr. Dorrien-Smith are Soleil d'Or, Scilly White, Telamonius, Obvallaris, Gloriosus, Rugilobus, Grand Monarque, Princeps, Cynosure, Incomparabilis plenus, Orange Phœnix, and Ornatus. All kinds will force, Mr. Brown says, but some much better than others.

(To be continued.)

EXHIBITIONS AND MEETINGS.

NATIONAL ROSE SOCIETY, July 14.

THE northern provincial exhibition of the National Rose Society was this year held in the grounds surrounding Spring Hall at Halifax in connection with the Salterhebble and District Rose Society. The grounds form a most suitable place for a rose show, as they are situate on the southern slope of a deep valley, and quite out of the bustle of Halifax town. The show was an especially fine one as regards competition for all the prizes in the thirty-five classes provided. The quality of the blooms was also good throughout, though little above that seen at the R.H.S. Rose Show held at the Drill Hall on Tuesday, July 12. Altogether this show was the best of the National Society's for 1898.

NURSERYMEN.

In the Jubilee Trophy class for the best thirty-six blooms distinct, Messrs. Harkness and Sons secured the first prize with a splendid lot of flowers, the varieties being Ulrich Brunner, Caroline Testout, Gustave Piganeau, La France, E. Y. Teas, Innocente Pirola, A. M. Rodocanachi, Lady Mary Fitzwilliam, General Jacquiminot, White Lady, Marquise Litta, and Her Majesty, in the back row; Kaiserin Augusta Victoria, Duke of Edinburgh, Maréchal Niel, J. S. Mills, Niphetos, Mrs. J. Laing, Marchioness of Londonderry, Comte Raimbaud, Souvenir d'Elise Vardon, Earl Dufferin, Comtesse de Nadaillac, and Comtesse de Ludre, in the middle row; Ernest Metz, Merveille de Lyon, Helen Keller, The Bride, Madame Cusin, Souvenir de S. A. Prince, Madame Delville, Madame Hoste, Marie Verdier, Catherine Mermet, Alfred Colomb, and Marchioness of Downshire in the front row; Mr. B. R. Cant, second; and Messrs. F. Cant and Co., third. There were five competitors.

Four competitors entered in the class for seventy-two blooms distinct, and here Messrs. Harkness and Sons were again first, showing handsome, bright and fresh flowers of Mrs. J. Laing, Ulrich Brunner, Madame Montet, Marie Baumann, Caroline Testout, Helen Keller, Captain Christy, Gustave Piganeau, Her Majesty, Auguste Rigotarde, Lady Mary Fitzwilliam, A. K. Williams, White Lady, Duchess of Bedford, Jeannie Dickson, Captain Hayward, Mrs. W. J. Grant, Marquise Litta, Baroness Rothschild, François Michelon, Innocente Pirola, Duchess de Morny, Marchioness of Londonderry, and Magna Charta, in the back row; Marie Verdier, Jean Ducher, Horace Vernet, Bridesmaid, Duke of Edinburgh, Muriel Grahame, Camille Bernardin, Cleopatra, The Bride, Madame Cusin, Earl of Dufferin, Maman Cochet, E. Y. Teas, Marchioness of Downshire, Marie Rady, Comtesse de Nadaillac, A. Colomb, Madame Hoste, Duke of Teck, Souvenir de Elise Vardon, S. M. Rodocanachi, Catherine Mermet, General Jacqueminot, Heinrich Schultheis, in the middle row; Margaret Dickson, Beauty of Waltham, Niphetos, Charles Darwin, Marie van Houtte, Madame Gabriel Luizet, Souvenir de S. A. Prince, Ethel Brownlow, Marchioness of Dufferin, Grand Mogul, Caroline Kuster, Star of Waltham, Dean of Rochester, Dr. Andry, Merveille de Lyon, Danmark, Kaiserin Augusta Victoria, Souvenir d'un Ami, Maréchal Niel, Dupuy Jamain, La France, Prince Arthur, Silver Queen, and Duc d'Orleans, in the front row. Mr. B. R. Cant, Colchester, came second, and Messrs. F. Cant and Co., third.

For three dozen trebles, Messrs. Harkness and Sons, Bedale, came again to the front with lovely flowers of Lady Mary Fitzwilliam, François Michelon, La France, Madame de Watteville, Madame Hoste, Madame Cusin, Captain Hayward, Margaret Dickson, Alfred Colomb, Marchioness of Downshire, Gustave Piganeau, Niphetos, Duchess of Leeds, Jeannie Dickson, Marquise Litta, Souvenir d'Elise Vardon, Earl of Dufferin, Francisca Kruger, Duke of Fife, White Lady, Fisher Holmes, Marchioness of Londonderry, Catherine Mermet, General Jacqueminot, Mrs. J. Laing, Kaiserin Augusta Victoria, E. Y. Teas, The Bride, Maman Cochet, Helen Keller, Mrs. S. Crawford, Innocente Pirola, Bridesmaid, Merveille de Lyon, Ulrich Brunner, and Souvenir de S. A. Prince; Messrs. A. Dickson and Sons, Newtownards, Co. Down, second, and Mr B. R. Cant third. Seven competitors put up stands of thirty-six blooms, distinct, and in this collection there was a grand lot of flowers staged. The winning stand came from Messrs. J. Townsend and Sons, Worcester, who showed Marchioness of Londonderry, Gustave Piganeau, Caroline Testout, Victor Verdier, White Lady, Maréchal Niel, Duke of Wellington, Madame Gabriel Luizet, Mrs. S. Crawford, and Madame de Watteville in fine condition; Messrs. J. Burrell and Co., Cambridge, second, and Mr. H. Norton, Louth, third.

The five competitors in the class for eighteen trebles made a splendid show, and, in a keen competition, Messrs. J. Townsend and Sons, Worcester, gained the first prize for very full blooms of Gustave Piganeau, Caroline Testout, Alfred Colomb, Marchioness of Londonderry, Victor Verdier, Mrs. J. Laing, Ulrich Brunner, La France, Marquise Litta, Merveille de Lyon, Louis van Houtte, Madame de Watteville, A. K. Williams, Pride of Waltham, Marie Baumann, Heinrich Schultheis, Earl of Dufferin, and Madame Gabriel Luizet; the second prize was secured by Messrs. G. Cooling and Sons, Bath; the third falling to Messrs. J. R. Pearson and Sons, Nottingham.

NURSERYMEN'S TEAS.

Only two competitors came forward in the class for eighteen tea or noisette roses, distinct, and here Mr. G. Prince, Oxford, managed to beat Mr. B. R. Cant, of Colchester, with fresh and full flowers of Comtesse de Nadaillac, Souvenir de S. A. Prince, Maman Cochet, Innocente Pirola, Bridesmaid, Souvenir d'Elise Vardon, The Bride, Souvenir d'un Ami, Princess of Wales, Madame Cusin, Etoile de Lyon, Catherine Mermet, Madame de Watteville, La Boule d'Or, Niphetos, Mons. Furtado, Miss Ethel Brownlow, and Madame Hoste. For twelve blooms, distinct, the first prize was won by Mr. J. Mattock, Headington, Oxford, with brightly coloured flowers of Innocente Pirola, Comtesse de Nadaillac, Souvenir d'Elise Vardon, Catherine Mermet, Souvenir d'un Ami, The Bride, Amazone, Souvenir de S. A. Prince, Caroline Kuster, Madame Cusin, Medea, and Ethel Brownlow; Messrs. J. Burrell and Co., Cambridge, second; and Messrs. Paul and Son, Cheshunt, third. There were seven competitors.

OPEN CLASSES.

Messrs. A. Dickson and Sons, Newtownard, took leading honours for twelve new roses, showing beautiful blooms of Ulster, Bessie Brown, Mrs. Conway Jones, Alice Grahame, Countess of Caledon, Nell Watson, Duchess of Portland, Lady Moyra Beauclerk, Mrs. Edward Mawley, Helen Keller, Mildred Grant, and Ards Rover; Messrs. F. Cant and Co., second. With lovely flowers of Kaiserin Augusta Victoria, Mr. G. Prince took first prize for a dozen blooms of any white rose; Mr. B. R. Cant, second, with Marchioness of Londonderry; and Messrs. Harkness and Sons, Bedale, third, with Marchioness of Londonderry. The best dozen blooms of any yellow rose were splendid examples of Comtesse de Nadaillac, shown by Mr. G. Prince, Oxford; Mr. J. Mattock, second; and Mr. A. Hill Gray, Bath, third, both showing the same variety. For a dozen flowers of any light pink or rose-coloured rose, Messrs. Harkness and Son came first with Mrs. J. Laing; Messrs. J. Townsend and Son, Worcester, second, with the same variety; and Messrs. A. Dickson and Sons, Newtownards, third, with the new Lady Moyra Beauclerck. Crimson roses were finely shown, and out of nine stands of a dozen blooms Messrs. J. Townsend and Sons scored with Gustave Piganeau; Mr. B. R. Cant, second, with Ulrich Brunner; and Messrs. F. Cant and Co., third, with Captain Hayward.

For twelve treble teas, open class, Mr. G. Prince, Oxford, was a good first, showing lovely blooms of Bridesmaid, Innocente Pirola, Souvenir d'un Ami, Boule d'Or, Souvenir de S. A. Prince, Catherine Mermet, Souvenir d'Elise Vardon, Maman Cochet, Comtesse de Nadaillac, The Bride, Madame Cusin, and Cleopatra; Mr. J. Mattock, second; and Messrs. F. Cant and Co., third, out of seven sets.

AMATEURS.

Out of six competitors Mr. E. B. Lindsell won the amateur trophy for two dozen blooms distinct, with exceedingly fine blooms of Helen Keller, Mr. J. Laing, Gustave Piganeau, Marchioness of Londonderry, Ulrich Brunner, François Michelon, Beauty of Waltham, Madame E. Verdier, Her Majesty, Dupuy Jamain, The Bride, A. K. Williams, Catherine Mermet, Horace Vernet, Innocente Pirola, Earl of Dufferin, Captain Hayward, Muriel Grahame, Alfred Colomb, Maman Cochet, Madame Hausmann, Souvenir d'Elise Vardon, Duke of Wellington, and S. M. Rodocanachi; the second prize was won by Rev. J. H. Pemberton, Havering, who had a fine S. M. Rodocanachi; and Mr. H. V. Machin, third.

Mr. Lindsell was also first in the class for three dozen blooms, distinct varieties, open amateurs' class, with handsome flowers of Ulrich Brunner, Her Majesty, F. Michelon, Marchioness of Londonderry, Gustave Piganeau, La France, Earl Dufferin, Kaiserin A. Victoria, Marie Baumann, Helen Keller, S. M. Rodocanachi, and Mrs. J. Laing, in the back row; Merveille de Lyon, Duchess of Bedford, Maman Cochet, A. K. Williams, Madame de Watteville, Duke of Edinburgh, The Bride, Duc d'Orleans, Catherine Mermet, Mrs. Hausmann, Muriel Grahame, and Dupuy Jamain, in the middle row; Le Havre, Mrs. S. Crawford, Comte Raimbaud, Souvenir d'Elise Vardon, Beauty of Waltham, Duchesse de Vallambrosa, Captain Hayward, Ernest Metz, Horace Vernet, Madame Hoste, Dr. Andre, and Marie Finger, in the front row. Mr. Machin, second; and Mr. R. Park, Bedale, third. Mr. E. B. Lindsell showed the best eight trebles, staging fine flowers of Mrs. J. Laing, Ulrich Brunner, Marchioness of Londonderry, Alfred Colomb, La France, Comtesse de Nadaillac, François Michelon, and Her Majesty; Rev. J. H. Pemberton, second; and Mr. H. V. Machin, third. Mr. H. V. Machin, Worksop, won first place for nine flowers of any one variety, teas and noisettes excluded, with Ulrich Brunner; Mr. E. B. Lindsell second, with Her Majesty; and Rev. J. H. Pemberton, third, with Mrs J. Laing.

Mr. O. G. Orpen took the first place for eighteen blooms, his La France, Madame de Watteville, and K. A. Victoria being very good; Mr. J. Bergen, Knebworth, second; and Mr. E. Mawley, Berkhamsted, third. Mr. O. G. Orpen showed the best half-dozen trebles with Mrs. J. Laing, K. A. Victoria, Souvenir d'un Ami, S. M. Rodocanachi, Catherine Mermet, and Madame Cusin; Mr. Mawley, second; and Mr. S. Bergen, third. Mr. Orpen had the best six blooms of any rose other than a tea or noisette, showing Kaiserin A Victoria; Mr. Conway Jones, second, with Alfred Colomb. These three classes were open only to growers of less than two thousand plants.

Mr. G. Moules, Hitchin, had the best twelve blooms in the division open to amateur growers of a thousand plants, and showed handsome blooms of Her Majesty, A. K. Williams, Baroness Rothschild, and Alfred Colomb; Mr. R. Hobbs, Worcester, second; Mr. J. Marsden, Carnforth, third. There were nine competitors. In the extra classes for amateurs, Mr. Whittle, Leicester, scored a first for four trebles, being closely followed by Mr. J. Marsden, Carnforth, and Mr. Moules, Hitchin. Mr. R. Hobbs, Worcester, won first prize for six blooms of any rose, save a tea or noisette, with Mrs. J. Laing; Mr. J. Edwards, Derby, followed with the same variety, and Mr. J. Bateman, Highgate, third, with Marchioness of Londonderry. In the extra open class for amateurs, for six blooms of new and distinct roses, the competition was good, and here the Rev. J. H. Pemberton took chief honours with Mrs. W. J. Grant, Madame Cadeau Ramy, Marjorie, Tom Wood, Souvenir de Madame E. Verdier, and another.

AMATEURS' TEA ROSES.

There were five competitors in the open amateur class for a dozen teas or noisettes, and here the first prize was awarded to Mr. A. Hill Gray, Beaulieu, Bath, for pretty blooms of The Bride, Maman Cochet, Comtesse de Nadaillac, Souvenir d'Elise Vardon, Catherine Mermet, Maréchal Niel, Souvenir d'un Ami, Medea, Alba Rosea, Bridesmaid, Innocente Pirola, and Cleopatra; Mr. O. G. Orpen, Colchester, second; and Mr. E. B. Lindsell, Hitchin, third. Mr. O. G. Orpen scored a first in the open amateur class for nine teas or noisettes, one variety, showing Souvenir de S. A. Prince; Mr. E. B. Lindsell, second, with Caroline Kuster; and Mr. A. Hill Gray, third, with The Bride.

For nine blooms, distinct, open to growers of less than 500 blooms, the Rev. J. H. Pemberton, Havering-atte-Bower, led the way with good blooms of Souvenir d'Elise Vardon, Maman Cochet, Madame Hoste, Empress Alexandra of Russia, Marie Bravy, Madame Cusin, Comtesse de Nadaillac, Bridesmaid, and The Bride; Mr. R. Hobbs, second; and the Rev. R. Powley, Warminster, third.

Mr. M. Whittle and Mr. Moules were first and second respectively for six teas or noisettes, distinct, in a class for growers of less than 200 plants. For half a dozen trebles, teas or noisettes, Mr. A. Hill Gray, Bath, scored with pretty flowers of The Bride, Maman Cochet, Maréchal Niel, Cleopatra, Medea, and Comtesse de Nadaillac; Mr. Conway Jones, Gloucester, second; and Mr. O. G. Orpen, third. With Souvenir d'un Ami, Mr. Moules won first prize for six blooms of any tea or noisette, the class being open only to divisions three and four; Mr. Conway Jones, second, with Maréchal Niel; and Mr. R. Hobbs, third, with Catherine Mermet.

In the local section, Mr. H. V. Machin won first prize for two dozen blooms; Mr. J. Marsden, second, and Mr. Mallinder, gardener to Miss Mellish, Hodsock Priory, third. Mr. H. Steward scored for a dozen blooms, and Mr. Mallinder took the lead for six blooms, distinct. Mr. Conway, Halifax, won prizes for charming rose boquets, so also did Mr. T. Farrar; Messrs. J. and R. Callander, Halifax, took leading awards for tasteful shower bouquets, for twenty-four roses, and also won in other classes. Mr. Midgely, Syke, was also a successful competitor.

GARDEN ROSES AND DISPLAYS.

Messrs. Paul and Son, Cheshunt, showed the best set of eighteen distinct varieties of garden roses, their best bunches being of Bardou Job, Celine Forestier, L' Ideal, A. S. Gray, W. A. Richardson, and Laurette Messimy. Mr. H. V. Machin, Worksop, second, and Messrs. Cooling and Sons, Bath, third. The best stand of a dozen bunches of garden roses, amateur division, was arranged by Mr. H. V. Machin, Worksop, who had bunches of splendid flowers, but the [illegible] rather too close together; the varieties were Bardou Job, Madame Pernet Ducher, Rosa Mundi, Perle d'Or, Crimson Rambler, Macrantha, Grand Duc de Luxembourg, Mignonette, W. A. Richardson, Anna Maria de Montravel, Gloire des Polyantha, and Gustave Regis; Rev. J. H. Pemberton, second, and Miss Mellish, Hodsock Priory, third.

The best display of roses arranged on a space of not more than twelve feet by [illegible] feet was arranged by Mr. G. Prince, Oxford, who had a lovely central set of Comtesse de Nadaillac surrounded by light bunches of garden roses, all charmingly set up. Messrs. J. Townsend and Sons, Worcester, second.

Medal Roses.

Gold Medals were awarded to two new roses from Messrs. A. Dickson and Sons, Newtownards, co. Down; these were Mrs. Edward Mawley, a beautiful tea rose shaped somewhat like Mrs. W. J. Grant; the colour being a peculiar combination of rosy flesh and soft fawn or buff. The other variety is named Mildred Grant and is a H.T. with immense petals of great substance; pale flesh colour; a very fine rose. A gold medal was also awarded to Messrs J. Cocker and Sons, Aberdeen, for a charming new H.P. rose named Mrs. J. Cocker.

The six *Silver Medal* blooms at Halifax were Mrs. Laing, shown by Mr. B. R. Cant; and Her Majesty, shown by Mr. M. Whittle, among H.P.s. The best amateurs' H.T. was Lady Mary Fitzwilliam, shown by Mr. Boyes, of Derby; the best nurserymen's H.T. was Bessie Brown, shown by Messrs. A. Dickson and Sons, Newtownards. Mr. E. B. Lindsell scored for the best tea or noisette in the amateurs' division with a lovely Catherine Mermet, while Mr. G. Prince secured a silver medal in the nurserymen's division with a superb Comtesse de Nadaillac.

Conference.

Immediately after luncheon, a very large number of those interested in roses adjourned to another tent to hear Mr. George Paul, V.M.H., read a paper on "Exhibiting Roses." The gathering was presided over by Archdeacon Brook, who introduced Mr. Paul. About forty were present when the conference commenced, and the number increased to a little over fifty during the reading of the paper. Mr. Paul stated that since 1860 he had been present at most of the leading rose shows; he well remembered the Chiswick shows in the fifties, and at that time the flowers were staged in boxes, much as now, though usually in triplets. The varieties were a few of the H. Ps., Hybrid Chinas and Gallicas, most of which have passed out of cultivation now. About 1860, and for many years later, the flower stems were placed low in the tubes, and the tubes sunk in the moss which the boxes were surfaced with, so that the blooms rested on the moss. Thanks to Foster's tube and support, and longer stemmed flowers, some improvement on the old plan had been made during later years. Advice as to cutting and carrying flowers to shows Mr. Paul considered to be almost useless, as experience could only bring the necessary knowledge. The speaker thoroughly disagreed with the present system of tying roses, maintaining that the practice resulted in an even set of sober-coloured flowers, whereas without it there would be more individuality and more of those beautiful salmon and other tints for which certain roses were noted, but which were seldom now seen at exhibitions. He conceded, however, that tying seemed a necessity to meet the requirements of present-day judges.

Having cut your roses, Mr. Paul advised that they be kept in the shade, duly wired and placed in water as quickly as possible. In taking them to a show he advised that either the exhibitor or some responsible assistant should accompany them to prevent accidents. In arranging a stand of blooms the proper method would be to place the largest flowers at the back and the smallest and best shaped ones to the front; have the most perfect flowers at the ends of the rows and keep maroons and yellows toward the centre of the stand. Mr. Paul stoutly objected to dressing of any kind, considering it fraudulent to transform a flower from its natural shape; removal of an injured petal and opening a bloom slightly were all he would permit.

With respect to garden roses Mr. Paul advised that the bunches for exhibition should be made up at home, making allowance for opening buds; he opposed any change in the present methods of staging and considered it most undesirable to limit the number of trusses per bunch. He maintained it would spoil the class to do so, as to limit the trusses to seven would result in too small a bunch of Perle d'Or, and too large a one of Crimson Rambler. The space limit and definite number of bunches was all that was necessary. The speaker thought something might be done in the way of exhibiting large round baskets of roses of one variety to produce good effects at shows. The displays of roses had not been a success, but he was persuaded, after seeing what Messrs. Perkins and Son had done at Newcastle, that classes for displays might be made of great value to an exhibition, if only more artistic ability were displayed and more time given to arrangement. In conclusion, Mr. Paul submitted that if exhibiting is to help on rose culture, if it is to add members to the N.R.S., it must move with the times; new classes must be instituted, all artificialism not only restrained but suppressed, and the Society and its exhibitors strive ever to be the leaders of rose culture and display in the kingdom.

Archdeacon Brook moved a vote of thanks to Mr. Paul, remarking that nothing would show so much their appreciation of what had been said as a good discussion; he hoped the spirit of controversy would prevail. He had enjoyed hearing the papers, although, as he humorously put it, his position in rose culture was that of impartial ignorance. Mr. E. Mawley seconded the vote of thanks, stating that the conferences had been instituted to encourage rose growing, and to encourage growing they had to encourage exhibiting, as only in this way could people be persuaded to take a keen delight in roses, and influence their friends. His greatest objection to tying was that it was difficult to get the exhibitors to remove the ties at the hour appointed for judging; however, a tied rose was penalised if left tied at judging time, so also was over-dressing. They wanted flowers as natural as possible, and anything tending to make the blooms unnatural must be discouraged. Mr. Mawley expressed sorrow at the absence of the Messrs. Perkins, of Coventry, from the present show, as they wanted to see the display classes better filled.

The Rev. J. A. Pemberton followed, and considered it impossible for an exhibitor to present his roses in the best phase of their possible beauty without dressing them somewhat. Over-dressing was an evil and one that the judges had it in their power to remedy. Given equal quality of flowers the stand that was dressed—not overdressed—would beat the one containing flowers that had not been assisted. He maintained that the N.R.S. encouraged dressing up to a certain point. He also pointed out that great alterations would have to be made if roses were to be shown quite naturally; at present the selection of growth, disbudding, wiring, and dressing were all tending to an artificial production of roses. Tying did not spoil colour to any appreciable extent. Roses should be judged according to their variety, and not all by one standard. Referring again to wiring as part of the system of dressing, Mr. Pemberton raised a laugh by pointing out that a grand lot of garden roses in the show were arranged in fine bunches, each bloom standing clear of its neighbour, and each bunch showing a face towards the visitor. The stand referred to had gained first prize, deservedly, but it had come from the gentlemen who had just been lecturing them upon the evils of dressing and artificiality in exhibiting. Personally he thought a limit should be placed upon the number of trusses a bunch of garden roses should contain. Mr. Cooling favoured Mr. Paul's views, and thought that in the matter of garden roses the number of bunches and the space to be filled should alone provide the limits.

Mr. Frank Cant contended that where roses had to be brought a long distance it was absolutely necessary to tie them to preserve them in anything like good condition. He agreed with Mr. Pemberton as to limiting the sprays a bunch of garden roses should contain, as only by that means could the public gain any sort of an idea of the habit of floriferousness of a variety; he saw no reason why a stand should not contain seven sprays of Crimson Rambler at the back, and seven of the pretty little Perle d'Or in front. Under the present conditions the prizes went largely to those who could cut the most flowers. Mr. Alex. Dickson also contended that tying was a necessity when roses had to travel considerable distances. Dressing should be allowed, if done naturally, but penalised when a flower had its shape altered. He thought exhibition roses could scarcely be staged better than now. Mr. H. V. Machin sided with Mr. Paul in the matter of garden roses, considering it a great mistake to limit the number of sprays per bunch. Mr. E. B. Lindsell urged that for long journeys tying was a necessity to preserve the flowers; without tying had been largely done the Halifax Show would have been not nearly so fine as it was. He regretted that tying caused some of the exquisite tints to vanish, but the evil of tying was slight. Mr. Paul had not drawn the line between dressing and over dressing; it was the latter that they all had to guard against. Mr. O. G. Orpen endorsed Mr. Lindsell's remarks, and drew a vivid picture of the journey his own roses had undergone from Colchester to Halifax; without tying he scarcely dared think in what state his blooms would have arrived. Regarding over-dressing, the judges had the remedy in their hands, and for his part he treated over-dressing as it deserved.

The vote of thanks was then put and carried, M. Paul thanking the company for their criticisms, and the brisk discussion. A vote of thanks to Archdeacon Brook for presiding concluded the proceedings.

AYLESBURY FLORAL AND HORTICULTURAL SOCIETY.

July 7.

The seventy-sixth summer show of this society was held in the Corn Exchange and Butchers' Market adjoining, and proved generally successful, the quality of the exhibits being up to the average. The weather was bright and somewhat sultry in the Corn Exchange, but outside, in the recreation ground, where the pastoral and children's entertainment and band were located, there was a refreshing breeze. To assist the display Lord Rothschild, Waddesdon Manor, and Lady de Rothschild, Aston Clinton, each sent a fine bank of foliage and flowering plants; Mr. J. Walker, Thame, sent a collection of sweet peas, very fine being the bunches of Emily Eckford, Grand Blue, Her Majesty, and Princess May; and Mr. H. Deverill, Banbury, staged a very showy collection of herbaceous perennials.

In the competition for groups of decorative plants the premier award fell to Colonel Hornsby Drake, Wootton House; Messrs. Ingram, Whitfield, and Co., second; this same firm leading in the class for flowering plants, with Mr. R. Hopkins, second, both bright exhibits, and comprising neat specimens of greenhouse subjects. In the class for a group of plants in bloom, Mr. John Walker made a lovely show with a large collection of the best forms of zonal pelargoniums, edged with Carter's hybrid streptocarpus; Mr. W. Tipler, gardener to Miss Smith-Dorrien, the Vicarage, Mr. J. Walker, and Mr. J. Morton, gardener to Mrs. H. A. P. Cooper, shared the awards in the classes for half-a-dozen each of double, scarlet, and rose or light coloured pelargoniums, with dwarf-grown densely-bloomed plants in variety. The groups of six varieties of stove and greenhouse plants from Mr. W. Tipler and Messrs. Ingram and Co. were fresh and fairly well bloomed. Single begonias in sixes were good, Mr. E. T. Mackrill leading, the double class being altogether poor. The class for ferns was well filled, Colonel Drake, Messrs. Ingram, and Mr. C. Pigott sharing the awards for full-sized specimens. Gloxinias from the Vicarage Gardens were exceedingly bright, as was the only collection of achimenes from Mr. W. Robins, gardener to Colonel Dyke Lee, Hartwell Park. Fuchsias, as graceful pyramids, occupied the centre of the fruit and cut flower staging, Mr. J. Morton scoring first for six and Mr. R. Hopkins for three varieties. Coleus were a small display, Mr. C. Pigott leading for six young plants. The collection of mosses from Mrs. H. Gurney was lovely; Mr. J. Walker presented the most attractive arrangement of a basket of bedding plants, his double and single pelargoniums telling in the way of colour. The premier specimen flowering plant was a grand fuchsia from Mr. J. Morton.

In the section for cut flowers the roses occupied a fair length of table space. For thirty-six single trusses Mr. J. Walker presented a nice fresh lot of developing blooms of A. K. Williams, Gustave Piganeau, Horace Vernet, Comtesse d' Oxford, Lady Mary Fitzwilliam, Baroness Rothschild, Charles Lefebvre, Heinrich Schultheis, Jeannie Dickson, Louis Van Houtte, La France, Captain Hayward, Duke of Edinburgh, Duke of Teck, Earl of Dufferin, Duke of Wellington, Marquise Litta, Mrs. Sharman Crawford, Mrs. John Laing, Merveille de Lyon, Caroline Testout, Ulrich Brunner, W. F. Bennett, Madame Gabriel Luizet, Margaret Dickson, Marie Finger, Marguerite de St. Amand, Catherine Mermet, Hon. E. Gifford, Anna Olivier, Souvenir de S. A. Prince, Madame Hoste, Souvenir d'un Ami, and Maréchal Niel; Mr. H. Warren, gardener to Lady A. de Rothschild, second, with a very excellent lot of blooms; he also securing the premier award in the amateur division for twenty-four varieties; Mr. T. Gurney, second; and Mr. W. Robins, third; while in the class for twelve single trusses Mr. H. W. G. Morris, chemist, Thame, secured the first award for a nice fresh lot, including several teas, also for a dozen varieties in the amateur section. Herbaceous perennials, as staged by Mr. Walker in the class for two dozen varieties, cut blooms, were even more showy than the roses, the handsome bouquets being attractively posed, very striking being the cannas in variety, phloxes Centaurea macrocephala, Coreopsis grandiflora, delphiniums, Dictamnus fraxinella, Gaillardia grandiflora, Polemonium alba, Heuchera sanguinea, Lychnis chalcedonica, pink Snowflake, viola Waverley Blue, Spiræa filipendula fl. pl., Lychnis Verveana splendens, Stenactis speciosa, and Spiræa aruncus; Messrs. Ingram, second. Mr. Walker was placed first for a vase of flowers; the premier hand bouquet being arranged by Mr. H. W. G. Morris. In the section for ladies Mrs. Morris was awarded firsts for three vases for dinner table, a bouquet of wild flowers, and a design of wild flowers, winning with very tasty arrangements.

Fruit was fairly well represented for the season, and for a collection of eight dishes Mr. H. Warren was first with Black Hamburgh and Foster's Seedling grapes, Stirling Castle peaches, Lord Napier nectarines, Brown Turkey figs, Black Tartarian cherries, President strawberries, gooseberries; Mr. W. Robins, second, with Black Hamburgh and Foster's Seedling grapes, Sutton's A1 melon, Lord Napier nectarines, peaches, figs, white raspberries, and John Ruskin strawberries, the last-named perfect in shape and grandly coloured. Mr. Robins was first in both grape classes with the afore-named varieties, and first for peaches with some grand fruits of Barrington; Mr. H. Warren, second in the classes for black grapes and peaches. Some large gooseberries were on view, Mr. Earl, first, with a dozen scaling nine ounces; Mr. H. Warren second, weight one quarter ounce less. Some very fine nectarines, named Precose de Croncels, were staged by Mr. E. T. Mackrill, and secured an award. Strawberries, cherries, gooseberries, and the three forms of currants were presented in fair numbers, but the red currants from Wootton House attracted much notice.

Vegetables were good for the season, specially so the cauliflowers, carrots, potatos, and peas. Colonel Drake led with a collection of twelve dishes, cauliflowers and winter onions; Mr. Warren for tomatos, carrots, and turnips; Mr. T. Gurney, in the potato classes; Mr. R. Hopkins, for cucumbers; Mr. E. W. A. Brooking, for peas; and Mr. Tipler, for basket of salad. Mr. Warren secured Messrs. Sutton and Sons' premier prize for six dishes, and Mr. J. Morton won Messrs. E. Webb and Son's for a similar collection. In the amateur section Mr. H. W. G. Morris secured firsts for strawberries, collection of hardy fruit, red currants, white currants, and cos lettuce; Mr. A. T. West led in the classes for a collection of six dishes, kidney and round potatos, and carrots; Mr. L. N. Simons came first for cucumbers, tomatos, and peas. About two dozen classes were provided for cottagers, and the whole of the one hundred prizes awarded were keenly contested and awarded for splendid allotment produce.

WOOD GREEN, July 9.

A LARGE exhibition was held in the Town Hall Grounds, Wood Green, on Saturday, the 9th inst. The display was somewhat crowded into a huge marquee, and was very largely of purely local interest, the classes for cottagers and amateurs being well filled with excellent exhibits throughout.

The best twelve roses in not less than nine varieties were shown by Mr. C. H. Martin, gardener to Mrs. Langton, Hendon, who showed fine flowers of Helen Keller, Caroline Testout, Gustave Regis, Mrs. J. Laing, Victor Hugo, A. K. Williams, La France, Duke of Fife, Captain Hayward, and Marquise Litta; Mr. Cragg, gardener to W. C. Walker, Esq., Winchmore Hill, second; Mr. Courteney Page, Enfield, third. Mr. Martin was again first in a class for twelve blooms in not less than six varieties, his best flowers being Helen Keller, Madame G. Luizet, Mrs. J. Laing, Kaiserin Augusta Victoria, and La France; Mr. Cragg, second; and Mr. J. Armstrong, third. Mr. J. Canham, gardener to C. H. Feiling, Esq., Southgate House, Southgate, was first for a dozen bunches of flowers, his gloxinias, begonias, roses, and sweet peas being good; Mr. Thomson, gardener to Miss Brown, Southgate, second. Mr. Cragg was first for six bunches, and Mr. Thomson second; both lots were very bright, but Mr. Cragg scored with orchids. Mr. G. W. Cook, North Finchley, scored for a dozen roses, distinct in the amateurs' section, showing Mrs. J. Laing, Francois Michelon, Caroline Testout, Captain Hayward, La France, Madame G. Luizet, Marie Baumann, Beauty of Waltham, S. M. Rodocanachi, and Dupuy Jamain. Mr. Cook was also first for nine roses; Mr. Thompson, Bounds Green, second. Mr. Thompson scored for six roses; Mr. Brewer, second. For half-a-dozen teas or noisettes, Mr. G. W. Cook led with Innocente Pirola, Ernest Metz, Rubens, and Anna Olivier; Mr. Thompson, second. The competition was fairly good throughout. In the amateurs' division for a dozen bunches of cut flowers the first prize was won by Mr. F. Haynes, Ash Cottage, Wood Green, with a good set of Plumbago capensis, Diplacus glutinosus, lantanas, begonias, fuchsias, Torenia Fournieri, calceolarias, stocks, balsams, roses, and zonal pelargoniums.

The best half-dozen stove and greenhouse plants were shown by Mr. H. Tilbury, gardener to C. Young, Esq., Southgate; they were large plants of Pandanus utilis, a fuchsia, Latania borbonica, Dracæna Baptisti, Adiantum formosum, and A. cuneatum; Mr. C. Canham second. Mr. W. Smith, gardener to S. Roberts, Esq., Winchmore Hill, had the best tuberous begonias, and the same competitor led the way for half-a-dozen gloxinias, showing splendidly grown and flowered plants; he also had the best six zonal pelargoniums, a creditable set. Mr. Cragg was first for six table plants, a graceful lot; Mr. Canham a very close second. Mr. Cragg won the chief award for six orchids, showing fair examples of Cattleya Harrisoniæ, Epidendrum vitellinum majus, Cypripedium Curtisi, Vanda cærulea, Cattleya Mossiæ, and Odontoglossum cordata. For a small group of plants, amateurs, Mr. J. E. Smith, Canning Crescent, was easily first. Some pretty little groups of ferns were staged by amateurs, and Mr. C. Le Riche, White Hart Lane, put up the best, using Platycerium alcicorne as a centrepiece; Mrs. N. P. Hodgson, Wood Green, second. Mr. G. Cragg was easily first for a large group, his cattleyas, Brassovola Digbyana, cannas, odontoglossums, &c., being pleasingly associated with ferns, palms, and caladiums; Mr. F. Canham second, and Mr. Tilbury, gardener to A. Young, Esq., Southgate, third.

The best floral display for a dinner table was a charming arrangement in white and yellow forms of Papaver nudicaule associated with fern fronds and gypsophilla; this was put up by Mrs. Wheaton, Muswell Hill; Miss Weston, Queen's Avenue, Muswell Hill, second, with pink sweet peas. Mrs. Driscoll, of Palmers Green, showed the best basket of flowers, pink and red roses.

Mr. Thompson showed a splendid lot of salading—cucumbers, radishes, tomatos, beet, mustard, cress, lettuce, and onions being admirably represented. The same exhibitor led the way in the open class for eight kinds of vegetables, showing a first-rate lot of tomatos, peas, broad beans, carrots, vegetable marrows, cauliflowers, and turnips; Mr. H. Tilbury, second.

A beautiful lot of liliums, Hemerocallis aurantiaca major, English irises, calochorti in variety, Gladiolus Colvillei in several forms, including the pretty Ruby Gem, came from Messrs. R. Wallace and Co., Colchester, and made up a very bright exhibit. Herbaceous flowers in a cut state were shown extensively by Messrs. A. Young and Co., Stevenage; delphiniums, poppies, pinks, and geums being very bright. Mr. H. G. Bourne, New Southgate, sent a small but most interesting exhibit of cacti that proved a centre of attraction. Mr. A. Perry, Winchmore Hill, staged a fine lot of hardy flowers, arranging a fine assortment of popular and useful subjects; liliums were good, so also were Heuchera sanguinea, Heliopsis scabra, Erigeron speciosum, Hemerocallis fulva, garden roses, delphiniums, Genista tinctoria plena, irises, &c. Messrs. R. and G. Cuthbert, New Southgate, put up a group of stove and greenhouse plants, liliums, cannas, and carnations figuring largely. Mr. T. Royle, Bounds Green, contributed succulents, his group including several good opuntias. Hardy flowers in abundance came from Mr. T. S. Ware, Tottenham; this was a bright exhibit and contained the brilliant Gladiolus Watsonianus, Hemerocallis aurantiaca major, Ixia longiflora, Lilium Grayi, Alstrœmeria pelegrina alba, Linum arboreum, &c. Sweet peas from Mr. F. G. Foster, Brockhampton Nurseries, made a charming and fragrant exhibit; the bunches were large and the flowers good. A few especially fine varieties noted were Scarlet Invincible, Meteor, Countess of Powys, Little Dorrit, Lovely, Mrs. Eckford, Salopian, Captain of the Blues, Royal Rose, Queen Victoria, and Emily Henderson.

A very handsome group of plants was put up at the end of the tent by Messrs. Hugh Low and Co., Bush Hill Park, Enfield; the crotons were finely coloured and well grown, Asparagus plumosus, Rex begonias, Cattleya Mossiæ, C. Mendeli, Lælia tenebrosa, Cypripedium Curtisi, associated with elegant aralias, ferns in variety, dracænas, dieffenbachias, &c. This firm also put up a splendid lot of roses. A bright group of orchids was arranged by Messrs. Stanley-Mobbs and Ashton, Southgate; cattleyas were very much in evidence, especially good forms of C. Mendeli and C. Mossiæ; Mormodes unicolor, Epidendrum aurantiacum major, Cœlogyne Dayana, Oncidium Lanceanum, and odontoglossums were also staged well by this firm. Messrs. J. Hill and Son, Lower Edmonton, put up a fine group of ferns, all well grown and artistically arranged; platyceriums, hanging baskets of davallias, aspleniums in variety, white and golden gymnogrammes, adiantums in variety, including a splendid basket of lovely tinted plants of A. scutum roseum, and some handsome examples of A. Farleyense, altogether a first-rate display. Mr. W. Rumsey, Waltham Cross, staged a large collection of cut roses, including bunches of garden forms and a box of Penzance briars. Messrs. Paul and Son, Cheshunt, displayed large bunches of hardy flowers, these making a good show with the several boxes of finely-developed roses.

NATIONAL AMATEUR GARDENERS' ASSOCIATION, July 9.

LAST year this flourishing society held its annual exhibition in the gardens of the Royal Botanic Society, and the experiment proved so successful that it was repeated this season, and, we are pleased to state, with still greater success. On this occasion the competitive collections were arranged in the corridor leading from the north entrance to the conservatory, instead of the tent, and the change was decidedly for the better, as the various products could be seen to greater advantage. The arrangements were, with but one exception, aptly planned and carried out by Mr. T. W. Sanders, the president, and Mr. L. Brown, the secretary; and, favoured by delightful weather, the visitors, who numbered between two and three thousand, appeared to thoroughly enjoy the excellent display of plants, cut flowers, fruits, and vegetables provided for their entertainment. The exception, to which it is our duty to refer, was the admission of exhibitors and visitors to the exhibition during the time the awards were being made, which not only delayed the work of judging, but greatly hampered those engaged in determining the relative merits of the competing collections. The practice of allowing the visitors to crowd about the tables during the time the judging is in progress appears to have become general in the metropolis, and should be checked.

The principal features of this interesting and successful gathering were formed by the roses, violas, and hardy flowers, while both fruits and vegetables were satisfactory. There was a keen contest for the first place in the class for a collection of six distinct kinds of hardy flowers, and in the result, Mr. A. Lewis, Beckenham, and Mr. A. Taylor, Finchley, were first and second with only half a point between them. Mr. Taylor staged in his collection a vase of superb blooms of Margaret Dickson rose. In the collection of six kinds grown out of doors, Mr. Needs, who was awarded the Dobbie Challenge Cup, had iris, delphiniums, roses, and sweet peas. Mr. Lance Gray, and Mrs. Marsh, Claygate, exhibited remarkably well in the class for four bunches of hardy flowers.

In the class for twelve roses, in which a challenge cup, presented by Messrs. F. Cant and Co., was offered as the first prize, Mr. G. W. Cook was first with a magnificent stand, and Mr. J. Bateman followed closely for second place with finely-developed blooms. For nine roses in six varieties Mr. E. R. Smith was first, Mr. J. Bateman second, and Mr. A. Taylor third, each staging excellent blooms. Mr. J. W. Jones, Woking, contributed a remarkably fine collection to the class for garden roses, and Mr. E. R. Smith, Muswell Hill, had a superb stand of twelve teas. There were five or six entries in the class for a vase of roses, in which the premier prize was presented by Mr. George Gordon, and this award was made in favour of Mrs. Morris, Thame, who had a vase of finely-developed blooms of Mrs. John Laing. Mr. G. W. Cook had a vase of fine blooms of La France, and Dr. Shackleton contributed a very tastefully arranged vase containing mixed varieties. Mr. G. W. Cook staged eighteen blooms of Mrs. John Laing, in a high state of development, as an extra, and was awarded the silver medal. Mr. Cook was first of seven competitors in the class for six roses with superb blooms of Mrs. J. Laing, La France, Caroline Testout, Ulrich Brunner, Mrs. Sharman Crawford, and Marie Baumann; Mr. J. Thompson, Bond's Green, second. In a second class for a vase of roses and for a bowl of tea roses, Mr. G. W. Cook was first.

Violas were staged in large numbers and superb condition, and the competition was very keen for the Pye Championship, and in the result Mr. D. B. Crane was adjudged the champion, and Mr. Leonard Brown and Mr. W. G. Reeve were second and third. Mr. Crane was first also for six bunches, with Mr. Reeve second. Mr. Leonard Brown had the award of the first prize made in his favour in a class for six sprays of violas, while for six sprays of rayless violas Mr. Sinclair was first.

In the class for a collection of fruit Mrs. Morris was first, and in that for a collection of vegetables Mr. F. M. Vokes occupied the first place, while Mr. J[illegible] had the best strawberries.

HANLEY FLORAL FETE.

ALTHOUGH only in its second year the Hanley Floral Fête has become already a most famous provincial horticultural display, and the exhibition which opened on July 6 was an unqualified success. The competition throughout was keen, and the attendance enormous. This success has been achieved largely by the ability and energy of the secretary, Mr. J. Kent. The classes this year were about twenty-five more than in 1897, and the entries rose from three hundred and fifty to over fifteen hundred, these representing about eight hundred and fifty competitors.

There was a keen competition in the group classes, and Mr. James Cypher secured the chief award with a cleverly executed design; besides the large money prize there was a handsome vase presented with the first prize; Mr. P. Blair, gardener to the Duke of Sutherland, second. For a group of orchids, Mr. Stevens, gardener to W. Thompson, Esq., Walton Grange, Stone, Staffs, was first with fine specimens; Mr. Cypher, second. Mr. Cypher was second for eight specimen orchids, but scored first for a dozen specimen stove and greenhouse plants, six foliage and six in flower; he also staged the best set of palms. Mr. Vause, Leamington Spa, was another successful competitor in the group and plant classes, following Mr. Cypher closely. Floral decorations proved a great success, Mr. Goodacre, gardener to the Earl of Harrington, Elvaston Castle, securing first prize for the best decorated dinner table. Mr. Goodacre also won first prizes for a pair of bunches of black grapes, for half-a-dozen dishes of fruit, and for strawberries.

In the rose classes Messrs. A. Dickson and Sons, Newtownards, co. Down, were almost invincible, taking firsts for forty-eight roses, for two dozen roses, for twelve blooms, for a new rose, and second for thirty-six roses. Messrs. M.

[illegible] and Sons, Newcastle, won a number of first prizes, especially for dis- [illegible] of roses and sweet peas; they also closely followed Messrs. Perkins and [illegible] Coventry, in the classes for hand and ball bouquets, baskets of [illegible], &c. Mr. Blair led the way for a dozen carnations, and to his other prizes [illegible] for eight orchids, nectarines, cherries, table plants, turnips, and [illegible] beans. Mr. J. Read, gardener to the Earl of Carnarvon, Bretby Park, [illegible] the best tomatos, melons, and round potatos, and also took several second [illegible] for grapes. Other especially successful competitors were Mr. McKnight, gardener to T. Bolton, Esq., Oakamoor; Mr. S. Mountford, Congleton; Messrs. Prior and Sons, Colchester; Messrs. Townsend and Sons, Worcester; Mr. J. McIndoe; Mr. C. Wilkins; Mr. J. C. Waterhouse, Preston; and Lord Bagot, Blithefield.

Non-competitive displays were both numerous and good, and they added considerably to the effectiveness of the exhibition. The Corporation of Hanley, to express their indebtedness to the non-competing exhibitors, awarded quite a number of gold and silver medals, as follows: Large gold medals to Messrs. J. [illegible] and Co., Holborn, for miscellaneous plants and flowers; Messrs. Charles- [illegible] and Co., Bradford, for orchids; Messrs. W. and J. Birkenhead, Sale, for [illegible]; Mr. B. R. Davies, Yeovil, for begonias; Messrs. Dicksons, Chester, for [illegible] flowers; and to Miss Hodgkins, Manchester, for skeletonised leaves, [illegible], and fruits. Gold medals to Mr. Goodacre for carnations; Messrs. Sander and Co., St. Albans, for new plants; Mr. J. H. White, Worcester, for hardy flowers; and the Icthemic Guano Company, Ipswich. Silver medals to Mr. H. [illegible], Wem, for sweet peas; Messrs. J. Peed and Son, Norwood, for caladiums; Mr. F. Walton, Birmingham, for cacti; Mr. Edwards, Sherwood, for ferns in [illegible]; Mr. Hartland, Cork, for tuberous begonias; Messrs. M. Jenkinson and [illegible], Newcastle, for floral decorations; Mr. R. Sydenham, Tamworth, violas; [illegible] Jarman and Co., Chard, cut flowers; Mr. Leighton, Newcastle, cut [illegible]; and Messrs. Webb and Sons, Stourbridge, for sweet peas.

NOTTINGHAM.

THE Nottingham Horticultural Society held a fine exhibition in the Arboretum on the 13th inst. There were about two hundred exhibits, and the average of quality was high. The most tasteful group was that staged by Mr. J. Ward, gardener to T. H. Oakes, Esq., Riddings House, who used palms, ferns, moss, orchids, &c., to great advantage; Mr. A. Wagg, gardener to Mr. S. Chealer, Ossington Hall, was a good second, Humea elegans being skilfully used in his group. Mr. R. J. Walters, gardener to Mrs. J. W. Leavers, The Park, [illegible] the best circular group, orchids being especially good; Mr. J. Taylor, gardener to R. Halford, Esq., J.P., second. Mr. Walters showed the best six stove and greenhouse plants, Mr. Ward the best crotons, and Mr. Forman the best stove-flowering plant; these were the leading plant exhibitors. Mr. Wagg scored in close competition in the class for a collection of fruit arranged on a table six feet by four feet; he showed fine peaches, nectarines, figs, grapes, melons, and pineapples; Mr. J. Read, gardener to the Earl of Carnarvon, second; and Mr. A. J. Elphinstone, gardener to E. Parry, Esq., Woodthorpe Grange, third. Mr. Oakes showed the best Black Hamburgh grapes, and Mr. Chambers the best Muscat of Alexandria. For hardy fruit, Mr. J. Baker, Basford, was first, and Mr. E. Wadsworth, Newton, second. Royal Sovereign secured for the City Asylum Committee, Mapperley, first prize for strawberries. Mr. Chambers and Mr. J. Read were first and second respectively for tomatos. The collections of vegetables were excellent, the first prize in the class for twelve varieties being won by Mr. J. Read, the cauliflowers and tomatos being especially fine; the City Asylum Committee, Mapperley, gained second place, several splendid sticks of celery and a quantity of well-cultivated mushrooms constituting noticeable features; Mr. J. Baker was third, and Mr. E. Wadsworth fourth. The collections of vegetables, six varieties, attracted a good number of entries; Mr. T. H. Oakes, however, was by far the best, and won the first prize, the second being awarded to Mr. W. Corah, and the third to Mr. C. Hill, Cyprus Road. Cucumbers were hardly up to the average, Mr. Read occupying the premier position, Mr. W. Corah and Mr. W. F. Mills meriting and gaining second and third respectively. The peas exhibited by Mr. G. Taylor, Robin Hood Chase, were placed first; Mr. J. Baker second, and the City Asylum Committee third. Messrs. Baker, Read, and Wadsworth scored in the order given for white kidney potatos; Messrs. Baker and Corah for coloured kidneys; Messrs. Read, Baker, and Corah for white round varieties; and Messrs. Baker and Wadsworth for coloured rounds.

Late Strawberries should, in my opinion, have more attention, as they do not suffer from frost like earlier ones, and the crop rarely fails; on the other hand, the plants are not so robust and need good culture. Such kinds as Frogmore Late and Elton Pine are very good for this purpose, but no garden of any size should be without Latest of All; unfortunately it is not the latest, but it is late, and its splendid quality makes it worth a place in all gardens. Oxonian and Waterloo are the latest. The last is not suitable for all soils, as at times it fails to fruit freely, but Oxonian will grow freely though it is not a highly-flavoured fruit. It is valuable for its late cropping, and this variety we grow two years, so that by planting a quarter every year we always have young plants to bear fine fruit. When the plants do not occupy the soil for a long period they may be placed much closer; we plant two feet apart between the rows, and eighteen inches between the [illegible]; if room is plentiful Royal Sovereign may be given two feet each way, as this [illegible] of hoeing and cleaning. As regards culture, I advise double digging, placing [illegible] portion of manure under the first spit, and in land at all infested with wire [illegible] give a thorough dressing of lime; we use gas lime, and it is one of the best [illegible] combating this pest. By taking runners when ready, placing them when [illegible] in nursery beds, and planting out early next spring in their permanent [illegible] they do well; of course, such plants cannot be expected to fruit the season they are planted, neither is it advisable to allow them to do so, but they will give a very heavy crop the following season, and in light land will well repay a surface dressing of manure the second winter. As the strawberry so soon loses vigour in unsuitable soil, it is necessary to obtain new stock at times to realise full results; the plants can be procured at such a reasonable rate now, and in small pots ready to plant, that cost is not a great item; then also there should be a trial of new kinds, carefully noticing the results for future guidance.—G. WYTHES, *Syon Gardens.*

"HE OUGHT TO BE PROSECUTED."—The indignant words fell from the lips of a [illegible] helplessly watching a drunken cabman brutally lashing his horse. It is, [illegible] to think how much cruelty goes unpunished in this world. Why are there so [illegible] in all grades of society? The explanation is simple. The blame lies with [illegible] and selfishness of parents. While men and women neglect their health they [illegible] expect to have strong and robust children. Fathers and mothers, be warned in time. [illegible] your systems of [illegible], indigestion, nervousness, and the like; restore your vigour and [illegible] by taking Holloway's Pills, the best and safest of family medicines.—[ADVT.]

ANSWERS TO CORRESPONDENTS

Editorial communications should be addressed to the Editor of the GARDENERS' MAGAZINE, 148 and 149, Aldersgate Street, E.C.

The Editor will be glad to receive photographs of gardens, plants, flowers, trees, fruits, &c., for reproduction in the GARDENERS' MAGAZINE. He will also be greatly obliged by correspondents sending early intimation of interesting local events relating to horticulture. In sending newspapers containing matter to which they wish to draw attention, correspondents are requested to distinctly mark the paragraph.

Specimens of plants, flowers, and fruits for naming or opinion should be sent to the Editor of the GARDENERS' MAGAZINE, "Endsleigh," Priory Park, Kew, Surrey, and as early in the week as possible. All parcels must be sufficiently prepaid.

Secretaries of horticultural societies are invited to send early notification of forthcoming exhibitions and meetings, and are requested to advise us concerning change of dates

Rhubarb.—J. S., Sandwich: Rhubarb is quite admissable in an unlimited collection of vegetables, but unless in very good condition it does not win many points at this season of the year. The edible part of rhubarb is the leaf-stalk, and the fact that this is utilised early in the year for tart making, and later on for preserves or wine, does not make it in any sense a fruit.

Sphagnum Moss.—H. C., Hants: The moss sent is true sphagnum moss, but it contains a larger percentage of the small headed wiry form than most orchid growers prefer. It is, however, a very clean sample quite suitable for orchids or for packing plants and fruit in. For fruit packing it should first be washed and then dried—preferably in the sun.

Scalded Grapes.—Grape: The grapes are badly scalded, and those berries affected will have to be removed. Faulty ventilation is the chief cause of scalding, but there are other causes, as you will see by reference to the "Answers" column in our issue of July 2 last. Neither name nor address were sent with the communication. If sending again, please give such information, not necessarily for publication.

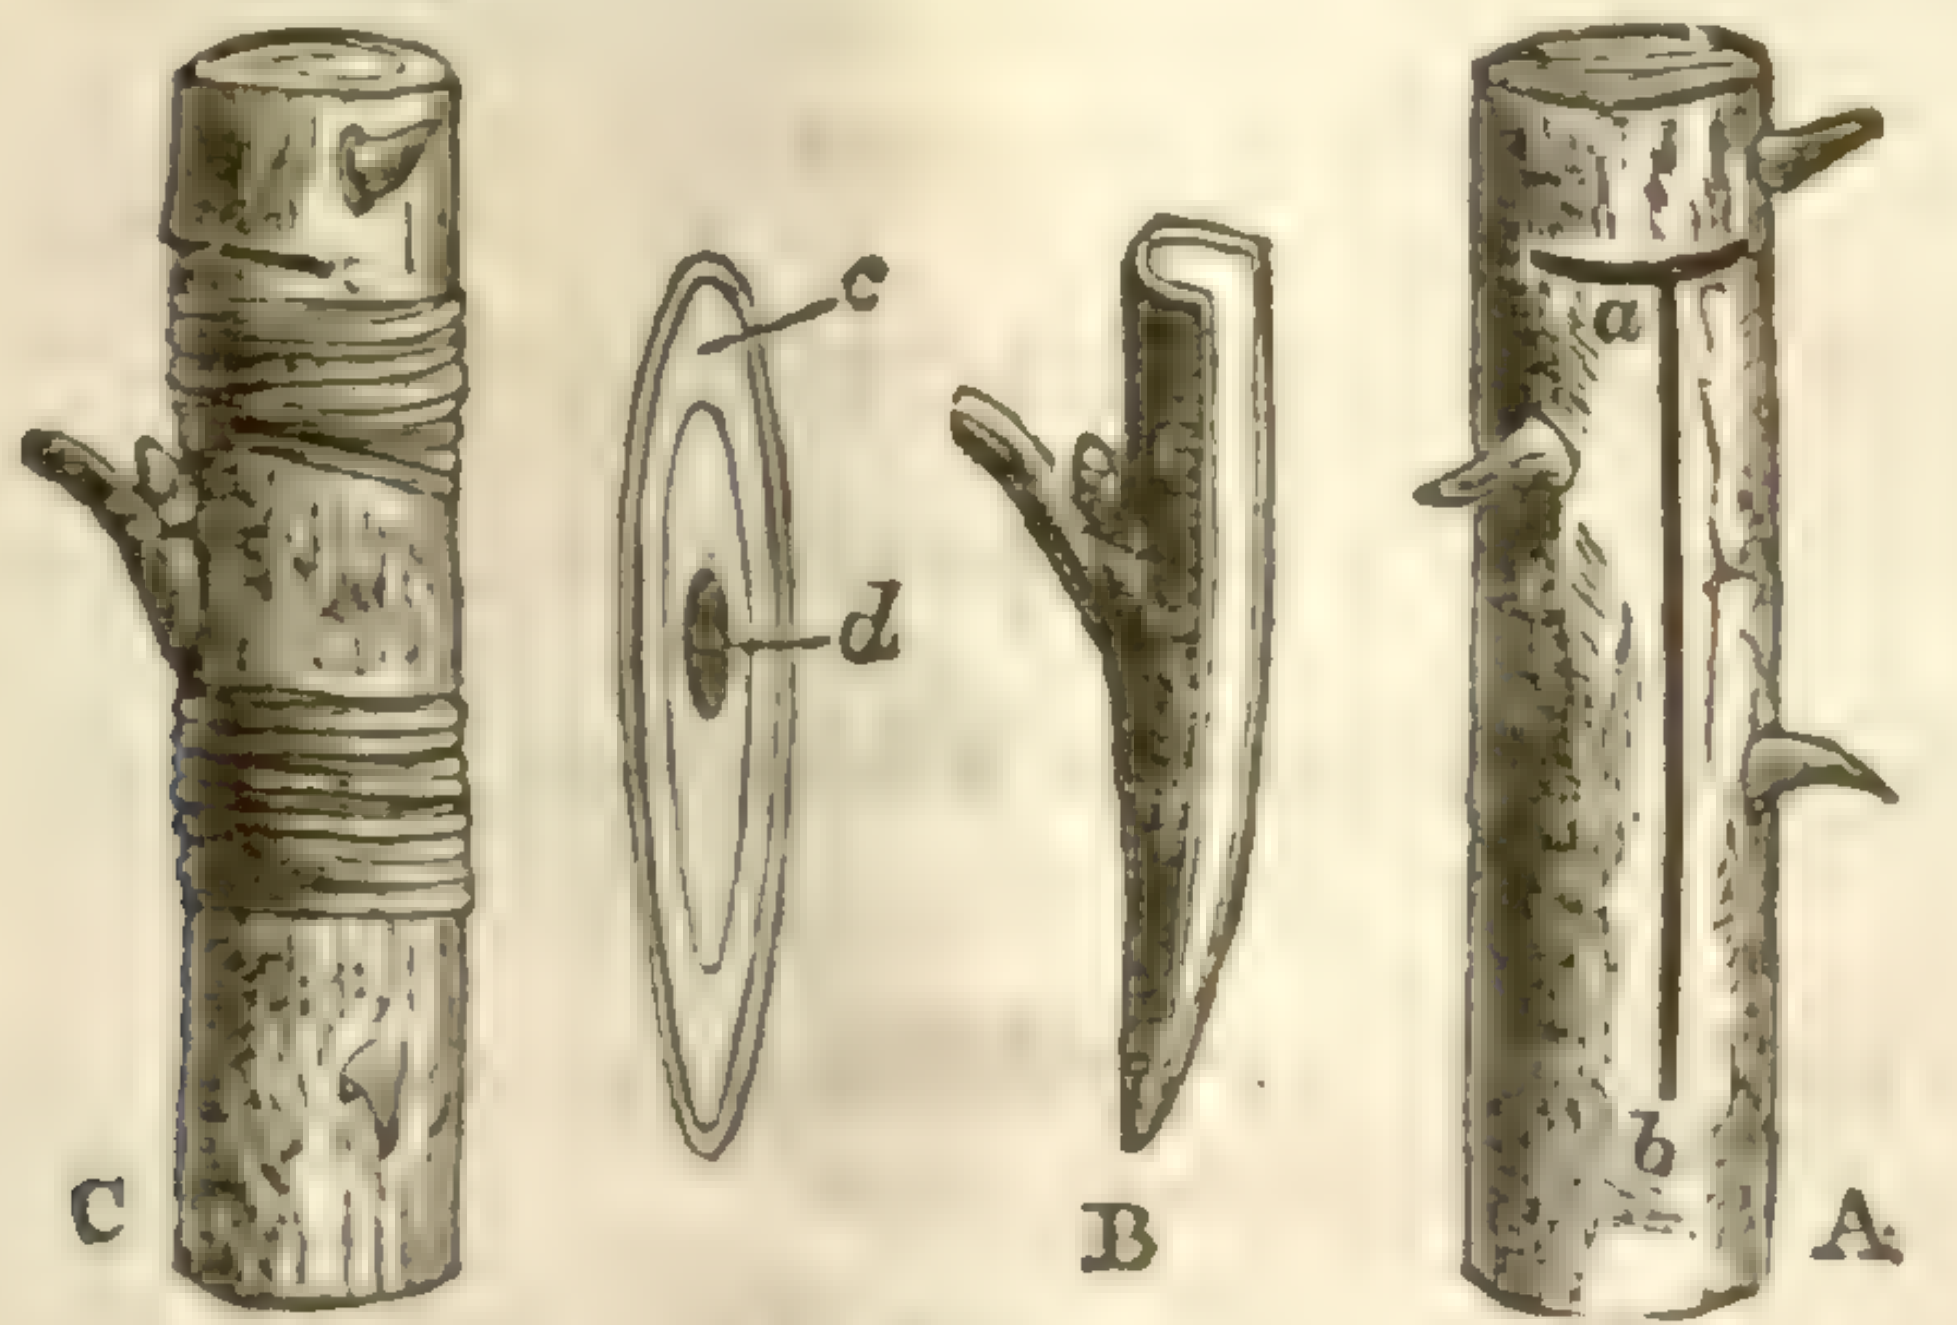
Exhibiting Hardy Flowers.—A. N., Wimbledon: It is not a usual thing to allow bunches of hardy flowers to be associated with any other but their own foliage at flower shows. In the case mentioned you were, however, within the terms of the schedule, but as it was a special class among so large a number of special classes, and, also, because of the absence of any class number upon the card attached to the exhibit, our representative had no ready means of discovering the unusual conditions, hence the criticism. Thanks for letter.

Cutting the Leaves of Tomatos.—W. C., North Berwick: We do not advise such extensive shortening of the foliage of tomatos as is carried out in some establishments. Shortening a leaf here and there to allow more light to reach the fruit is, of course, allowable, and serves a useful purpose. When tomatos are planted a reasonable distance apart and all lateral growth suppressed there should be little need for the removal of leafage. With outdoor tomatos the case is somewhat different, for in the autumn such plants often carry a large number of unripened fruits. Under any circumstances such fruit cannot long remain unprotected, consequently almost all the foliage may be cut off at the end of the season, so that the remaining fruit may be ripened, as far as possible, ere cold nights compel the grower to cut them, and place them in a pit or greenhouse to finish. Spraying the flowers of tomatos would assist fertilisation, but such a practice is unnecessary and not good for the plants. A rabbit's tail is a useful article for transferring the pollen from anther to stigma in cases where a difficulty is experienced in obtaining a good set of fruit.

Diseased Leaves on Mdme. Carnot Chrysanthemums.—J. S., Slough: The leaves are suffering from a weakness peculiar to the variety and from which it seldom escapes entirely in any collection. Mr. W. H. Lees writes that the cause is not easily defined, and though attributed variously during the past few seasons subsequent experience has proved that we have not yet hit upon the exact cause. For about eighteen inches up the stem we lose no leaves, then, like your correspondent's samples, our leaves go yellow here and there, in some cases whole leaves have to be removed, in others only part of the leaf. The trouble commenced this year about June 20 and ceased about July 10, and we do not anticipate losing any more leaves, in fact, those partially affected have regained a healthy tone. Half our plants are quite sound and we have given a little weak liquid cow manure and soot to stimulate those affected. Late propagated plants escape the disease best but I do not recommend this practice if large blooms are desired. The whole family of sports have suffered more or less, but previous years' experience is, as above stated, that the trouble does not last long and has not appeared to effect the ultimate results. Feed the plants gently if they have plenty of roots, and once a week a very weak solution of sulphate of iron will help, but extreme care must be taken that the dose is not more than half an ounce to one gallon of water.

Paraffin Emulsion for Caterpillars.—G. P., Tewkesbury: The American prescription for a paraffin emulsion to be used for the destruction of catterpillars and other fruit tree pests is as follows: Use one-fourth of a pound of hard soap, preferably whale-oil soap, and one quart of water. This is heated till the soap is dissolved, when one pint of kerosine oil is added, and the whole agitated till a perfect mixture of emulsion is formed. The agitation is easily secured by use of a force pump pumping the liquid with force back into the vessel holding it. Water is then added so that there shall be kerosene in the proportion of one to fifteen; or, kerosene, one pint; common laundry soap, half-ounce; rain water, half pint. The soap is boiled in the water till all is dissolved, then the boiling soap-suds are poured into a watering pot containing the kerosene, and churned with a garden syringe until the emulsion is complete. This generally takes about five minutes, sometimes longer. When this emulsion is made, it can be bottled up for future use. When using it, either as a wash for sponging trees or for spraying, it must be diluted with nine times its quantity of water. Should the oil in the emulsion after a time separate, it is well to warm it, and by violently shaking the bottle it will again become fit for use. In diluting the emulsion use warm water. Soft soap and paraffin oil makes a capital wash for hops, and is a desirable mixture to apply to the bark of fruit trees. The proportions for large quantities are—soft soap twelve pounds, and paraffin oil, half-gallon, to one hundred gallons of hot water. The nearer to boiling the water is used, the better the paraffin mixes. This mixture should be stirred well together and used when cool.

Budding Roses.—R. S. C., Tunbridge Wells: To bud roses is in itself a very simple matter, and by careful attention to the few necessary details, an amateur may obtain a large measure of success after a little practice. Whether the stock be the hedgerow, or cutting brier or the mannetti, it should be clean and nicely furnished with roots. Cutting briers and mannetis usually have sufficient roots, but briers from the hedgerow are frequently indifferently furnished with them. Briers should always be planted in soil prepared precisely the same as for roses, and the budding done at the end of June, or as early in July as the bark parts readily from the wood. Remove nearly, if not all but the two shoots to be budded early in June, and in budding them, make an incision in the upper side from *a* to *b*, as shown at A. Then from a shoot of the variety with which the stock is to be budded, take off a shield-shaped portion as at B. When first removed, the bud will be of the shape shown at *d*, and in its preparation cut off the top at *c*, and remove the portion of wood; if there is a hole at *d*, the bud will have been removed with the wood, and the shield rendered worthless. The bud being ready, lift the bark on either side of the incision with the handle of the budding knife, slip the bud in, and make it secure by binding it with cotton or bast, as in C.



BUDDING ROSES.

A, shoot with cross-cut *a* to *b*; B, bud; C, shoot with bud inserted and bound with bast; *d*, back of bud.

Names of Plants.—Under this heading we can only undertake to name species and specific varieties of plants, and not florists' flowers. Specimens should be packed in stout boxes with damp moss or leaves as packing material to ensure their reaching us in a fresh state. It is essential that flowers must accompany specimens of flowering plants, that fern fronds be fertile, and that the numbers be legible and firmly attached to the specimens. We cannot promise to name more than six specimens at one time from any one correspondent.

J. T., Birkenhead: 1 and 6, see next week; 2, Quercus Ilex; 3, Galium verum; 4, Trifolium arvense; 5, Allium scorzonerifolium.

H. C., Hants: 1, Veronica incisa; 2, send when in flower; 3, Alstrœmeria aurantiaca; 4, Agrostemma coronaria; 5, Oncidium pulvinatum.

F. A. R., Royston: Lathyrus sativus; quite a common plant.

A F. T., London, N.: 1, Hemerocallis fulva; 2, Pyrethrum Parthenium fl.-pl.

H. B., Ipswich: 1, Poa cæsia; 2, a scirpus, not recognisable without flowers; 3 and 4, send again when flowering.

J. W. W., South Ealing: Ligustrum japonicum.

H. C. B., Battle: Dictamnus albus var. purpureus.

J. M., no address sent: Inula britannica.

F. H., Sudbury: Two varieties of the pallida section of German irises. We do not undertake to name florists' varieties, such as these irises, but would probably have supplied the names but that the varieties are over in the South of London, and there is no ready means of identification.

W. J., Brentwood: 1, Maranta zebrina; 2, Sedum arboreum variegatum; 3, Kleinia pugioniformis; 4, Lippia citriodora; 5 and 6, Gasteria and Mesembryanthemum respectively; send when in flower; 7, Symphoricarpus racemosus.

C. W., Knebworth: 1, Philadelphus coronarius; 2, Erigeron speciosum; 3, Hieracum aurantiacum; 4, Lagurus ovatus; 5, Lavatera arborea; 6, Galega officinalis.

S. T., Durham: 1, Empetrum nigrum; 2, Calochortus pulchellus; 3, Sedum deltoideum; 4, Nephrodium molle corymbiferum; 5, Cassia florida.

H. C. H., Ringwood: 1, Cotoneaster microphylla; 2, Lilium Martagon purpureum.

Names of Fruits.—We are pleased to assist our readers as far as it is possible to do so in naming fruits, but it is absolutely necessary that they should send us good specimens carefully packed, as it is only when characteristic examples reach us in perfect condition that we are able to determine their names. We are compelled to insist on the observance of this rule, as so many specimens now reach us. We cannot undertake to name more than six varieties at one time; and both apples and pears should be sent when approaching maturity, but before they are fully ripe, that we may have the assistance of their distinctive colours in determining their identity.

A. G., Frome: The specimen was rather too ripe when sent, and was badly split upon receipt. It appears, however, to be a large example of Lord Napier nectarine.

Fruit Trees and Drought.—"Lux," in a recent Morning Mixture, comments on Mr. Fish's remarks respecting the effect of drought on fruit trees, and he makes the astonishing inquiry, When have we had a more saturating spring than this year? Evidently "Lux" must reside in a much moister neighbourhood than some of us at South Bucks. I could easily prove to him that in this district at least it has been the dryest winter and spring that has been known during the past forty years, and that ponds and wells never before known to fail are now quite dry. In my opinion both fruit and coniferous trees are suffering from insufficient moisture at the roots, and have been for some time past, and this, combined with the cold spring, has been responsible for the "disastrous sweep of all classes of orchard fruit" this year.—SOUTH BUCKS.

OBITUARY.

MR. EDWIN THORNE died, we regret to learn, at his residence, Chalfont Kingston Road, Oxford, on Sunday evening, July 17, after an illness nine weeks, traceable to a strain produced while thinning grapes. Deceased, who was in his sixty-fourth year, was an enthusiastic amateur horticulturalist, having received more premier prizes than any other exhibitor in the section at the Oxford shows for roses, fuchsias, zonal geraniums, and He was the son of a farmer at Bloxham, near Banbury, and, as a youth, was in the town clerk's office, Banbury, being afterwards elected to the position of butler at Wadham College, Oxford, which office he creditably sustained up to the period of his death. For several years he was on the committee of the Royal Oxfordshire Horticultural Society, and had been vice-chairman of the society during the past four or five years. While at Banbury he became an onion grower, and his specimens at the Oxford shows were always finely finished bulbs. He was also a clever cultivator of celery, carrots, parsnips, and potatos. He leaves a widow, five daughters, and three sons.

MARKETS.

Covent Garden.

THE market is now well supplied with a large variety of good fruit and There is a steady business in all departments, and prices are moderate, strawberries, which are rather dear.

FRUIT.—Strawberries, 2s. to 4s. 6d. per peck; 3s. to 6s. per dozen raspberries, 4s. to 5s. per dozen punnets; cherries, 3s. 6d. to 8s. 6d.; black 5s. to 6s. 6d.; red, 3s. 6d. to 4s. 6d.; gooseberries, 2s. to 3s. per half-sieve; grapes, 1s. to 2s.; Jersey, 10d. to 1s. 6d. per lb.; English tomatos, 4d. to 6d.; 3d. to 4d. per lb.; Spanish, 10d to 1s. 4d. per box; bananas, 5s. to 10s. per bunch; pineapples, 2s. to 4s. 6d. each; lemons, 6s. to 16s. per case; French apricots, 5s. to 8s. per dozen boxes; French peaches, 1s. to 2s. per box; English, 2s. to 8s. per dozen; green figs, 2s. to 4s. per dozen; French greengages, 1s. to 1s. 6d. per box.

FLOWERS.—Arums, 3s. to 4s.; carnations, 1s. to 3s.; eucharis, 2s. to 4s.; gardenias, 1s. to 3s.; Lilium Harrisi, 3s. to 4s.; tea roses, 6d. to 1s.; pink roses, 2s. to 5s.; red roses, 1s. to 4s.; cattleyas, 6s. to 9s.; Odontoglossum 1s. 6d. to 4s.; and tuberoses, 1s. to 1s. 6d. per dozen blooms; cuneatum, 4s. to 8s.; marguerites, 2s. to 4s.; mignonette, 2s. to 4s.; (scarlet), 4s. to 6s.; stephanotis, 1s. to 2s.; lily of the valley, 6d. to 1s.; gladiolus, 6d. to 9d; and pelargoniums, 4d. to 6d. per dozen sprays.

VEGETABLES.—English onions, 2s. to 3s. per dozen bunches; ports, per case; peas, 1s. 6d. to 2s. 6d. per bushel, 2s. 6d. to 4s. per bag; per bushel; French beans, 2d. to 3d. per lb.; 2s. to 3s. per flat; to 8s.; garlic, 3s. to 3s. 6d. per 12 lb.; turnips, 3s to 4s.; carrots, 3s. to 1s. to 1s. 6d.; mint, 1s. 6d. to 2s. per dozen bunches; endive, 1s. cucumbers, 1s. to 3s. 6d.; cauliflowers, 1s. to 2s. per dozen; beetroots, cabbages, 3s. to 4s. per tally; Jersey potatos, 4s. 6d. to 5s. 6d.; St. Malo, 5s.; Cherbourg, 4s. 6d. to 5s. 6d.; Kent, 5s. 6d. to 6s. 6d. per cwt.

Borough Potato Market.

The demand continues good, but supplies are daily becoming heavier. Prices are moderate. English kidneys and White Beauties, 5s, to 5s. 6d.; St. Malo, 4s.; Jersey Flukes, 4s. 6d. to 5s.; kidneys, 3s. 6d. to 4s.; Cherbourg Flukes, 4s.; kidneys, 3s. 6d. per cwt.

THE WEATHER DURING THE WEEK ENDING JULY 16, 1898.

The mean reading of the Barometer during the week at Greenwich was 29·98 inches, and that **of the Thermometer** 61°·9, the latter being 0°·8 below the week's average in the 50 years 1841—90. The direction of the wind was variable, the horizontal movement of the air being 1 per cent. below the week's average in the 16 years 1860—75. The duration of registered bright **sunshine in the week was** 52·0 **hours.** The measured rainfall amounted to 0·02 of an inch.

ENGAGEMENTS FOR THE ENSUING WEEK.

MEETINGS.

TUESDAY, JULY 26.—Royal Horticultural Society: Committees meet at 12 o'clock; 3 p.m. on "Economic Uses of Bamboos," by A. B. Freeman-Mitford, Esq., C.B.
National Cactus Society: Exhibition to be held at the Drill Hall, St. James's Street, Westminster, in connection with the R.H.S.
Tibshelf Horticultural Society.
WEDNESDAY, JULY 27.—Brightstone (I. of W.) Flower Show.
Highclere Horticultural Society.
Beckenham Horticultural Society.
THURSDAY, JULY 28.—Leigh and Bransford Horticultural Society.
Bedale Rose Show.

PRACTICAL LANDSCAPE GARDENING and ESTATE DEVELOPMENT CO.

This Company undertakes to advise as to the laying out of gardens, the general improvement of landed property, and the development of building estates; to provide plans and estimates, and, for a fixed sum, to carry out all work incidental to the making of the smallest Villa garden as well as to the designing and execution of the most extended estate improvements.

It has a staff of experienced foremen, and all necessary plant.

No charge whatever is made for plans, which, however, remain the property of the Company unless the work is carried out by it.

All communications to be addressed to—

Advertisements under this heading are charged 1s. each, four lines (32 words), and 3d. per line after. A Copy of the "Gardeners' Magazine," Post Free, 2½d.

THREE INSERTIONS FOR THE PRICE OF TWO!

A MAN WANTS SITUATION in a suburban nursery; low wages would be accepted in return for extended experience in nursery.—E. Elsley, 10, Redman Place, High Street, Sevenoaks.

AN UNDER GARDENER, age 22, over five years' experience (Inside and Out) in one situation, DESIRES to find WORK under a Head Gardener, who would be willing to teach him the higher branches of gardening; nursery [illegible] objected to.—Write, stating wages and duties expected, to his employer, the Rev. E. Borradaile, Mere, Wilts.

FOREMAN (Inside or General); aged 26; thoroughly competent, and highly recommended by past and present employers.—J. Scovell, Albury Park Gardens, Guildford.

GARDENER (Head); age 25; WANTS SITUATION where two are kept; life experience in all branches; well recommended; single or otherwise.—Wm. Daniels, The Gardens, Eastwood Hall, Eastwood, Notts.

GARDENER (Head) where others are kept; life experience in all branches, including orchids and pines; age 34; married, one child; good references; Midlands preferred.—G. F., Church House, Rowner, Gosport.

GARDENER, who has worked in the States several years, wishes a SITUATION as such in nursery or gentleman's garden. Has been used to rose and carnation culture, tomato and melon growing, and has good knowledge of all departments; testimonials excellent; served apprenticeship in England.—William Attwood, Charlton Kings, Cheltenham.

GARDENER (Head Working, where two or more are kept); age 32; life experience in all branches; excellent reference.—Sellwood, 24, Manchester Road, Reading, Berks.

GARDENER (Head); age 39; married; experienced in all branches; six and a-half years in last situation as head; left through establishment being broken up; can be well recommended.—Address C. Russell, Clayton West, Huddersfield.

GARDENER wishes to meet with good Family requiring experienced man; long and varied experience: vines, hothouses, &c.; married, no family; not object to single-handed; state requirements, size of garden, wages, &c.—W. T., 9, James Lane, Muswell Hill, N.

GARDENER (good Single-handed or where another man is kept); 15 years' experience; 4½ years in last situation; married; age 30.—J., 111, Wellington Terrace, Wellington Street, Slough, Bucks.

GARDENER (Single-handed, or one under); age 45; thoroughly experienced in all branches; no objection to cows; married; good references; total abstainer.—J. Knight, Gothic Cottage, Lowfield Heath, near Crawley, Sussex.

GARDENER (Single-Handed, or where two or three are kept); 10 years' good references from good establishments.—C. Gosling, North Cray, Kent.

GARDENER (under) SEEKS SITUATION, Inside or Out; age 22; good character; life abstainer; disengaged.—Apply W. Shiner, Milefield Street, Somerset.

JOURNEYMAN (Second or Third); Inside in gentleman's establishment; three years' experience; age 19; good character and references; abstainer.—J. Redding, Holbrook, Ipswich, Suffolk.

JOURNEYMAN (First); age 24; good knowledge of forcing vines, peaches, melons, cucumbers; stove, greenhouse, house decorations; two and a-half years in present place.—J. Edge, Osterley Park, Isleworth, Middlesex.

MR. COOK, Compton Bassett, Calne, Wilts, wishes to RECOMMEND a Young Man as FOREMAN; 13 years' experience; thoroughly practical and trustworthy.

RICHARD SMITH and CO., beg to announce that they are constantly receiving application from Gardeners seeking Situations, and that they will be able to supply any Lady or Gentleman with particulars, &c.—St. John's Nurseries, Worcester.

WANTED, SITUATION as Second Gardener.—Apply C. Brandrick, Six Cottages, Whitley Common, Coventry.

YOUTH; age 19; SEEKS SITUATION as Under Gardener in Gentleman's establishment; thirteen months in last situation; strong; willing; total abstainer; and good character.—Apply, E. H., care of Mrs. Barnett, Manor Road, Farncombe.

NOTICE TO ADVERTISERS.

Owing to continued increase in circulation, the "Gardeners' Magazine" now goes to press on Wednesday. No advertisement can be guaranteed insertion, or altered, unless received before Four p.m. on that day.

NOTES OF THE WEEK.

EARLIER OPENING OF KEW GARDENS.

DURING the agitation in favour of the opening of the Royal Gardens, Kew, at an earlier hour than noon, we were assured both by speakers at the meetings and writers in the local Press, that the gates were beseiged by visitors anxious to gain admittance long before they were thrown open, and that there was a strong desire on the part of business and professional men and the working classes to enjoy the beauties of the gardens before mid-day. It mattered not that the gardens remained open until so late an hour in the evening during the summer, that both the business men and the working classes could visit them without neglect of business on the one hand, and loss of time and wages on the other, the forenoon was the only period in which their full enjoyment was possible. Our opinion of these absurd assertions was expressed in no hesitative manner; but the agitators were persistent, and the First Commissioner yielded to the pressure, and arrangements were made for opening the gardens on week-days at ten a.m. The gardens have been opened during the past two months at the earlier hour, and the results have been in exact accordance with our anticipations, and the local Press are beginning to give expression to their sense of disappointment that the business man has not deserted his counting-house, and the labourer left his work, to enjoy a morning stroll in the gardens. The *Richmond and Twickenham Times*, which was the most zealous of the advocates of the change which has been made, says: "So far the early opening of Kew Gardens has not attracted a great number of visitors. We believe we are correct in stating that the average attendance before noon is under two hundred. A large proportion are children, and we have heard complaints of the presence of loafers—the chronic 'out of work' men, such as one is apt to see on the Thames Embankment. These, of course, are just the people that require a good deal of looking after, and if they are present during the morning hours, when ordinary visitors are few and far between, they will want all the more watching, and so the expense for constables will be increased. Of course it is very delightful to be in the Gardens when visitors are few, but what is wanted is a fairly numerous sprinkling of people, for all the mischief is done when there are only a handful of visitors in the Gardens. The public are their own police when there are plenty of them. At the same time it would not be fair, at this early date, to draw deductions from the facts we have mentioned as to the success or failure of the early opening experiment. The public generally have not yet got it into their heads that the Gardens are open to them during the morning hours. This is a new idea, and it is astonishing to see how long it takes to get rid of an old idea and plant a new one in the mind of the great British public. The people will come in time." Will they? We very much doubt there being any material increase in the number of visitors, which we believe from our observations to be much smaller than stated by our contemporary. As the case stands, according to the showing of one of the strongest advocates of the change that has been made, the proper work of a great scientific establishment has been greatly hindered for no other purpose than providing a playground for a few children and a lounging-place for loafers during the forenoon.

ACIDITY OF ROOT SAP.

IT is well understood that the power of plants to take up plant food from the soil is intimately connected with, if not directly dependent upon, the acids contained in the sap of their roots, which being exuded by diffusive exchange so as to act upon the soil particles, will, according to its nature and strength, be capable of dissolving a greater or less amount of mineral substances for the use of the plant. The root-sap acidity of a large number of plants has been determined by Dr. Bernard Dyer, who has also compared the results obtained by the action of a solution of citric acid of corresponding strength upon the soils of the Rothamsted experiment station. He has thus shown, in accordance with Professor Maerker's previous statements, that there is a close correspondence of the cultural results obtained from the soils with the amounts of soil ingredients extracted by the weak citric acid; so that, so far as the mineral plant food ingredients are concerned, the manurial requirements and needs of the soils can be foreseen or deduced from such determinations. We are told by Professor E. W. Hilgard, that at the University of California, numerous corresponding determinations made at that station with cultivated as well as with virgin soils, have corroborated to a remarkable degree Dr. Dyer's results; so that we appear to have in this method, varied according to the nature of the soils and crops, a means of determining the cultural condition of our fields and gardens. It seemed especially desirable to test, with a view of such determinations, the root sap of citrus trees, the fertilisation of which is practised more extensively at the Californian station than that of any other one crop, while a great deal of money is doubtless spent uselessly upon the purchase of ingredients not needed as yet. The results obtained show that there exist not inconsiderable differences between the acidity of the roots from different localities, and especially between the large and small roots. The latter being the ones actually active in the absorption of plant food, of course are the more reliable index of the solvent power actually brought to bear upon the soil particles. But the comparative analyses of the bark and wood of one and the same root, also show that the acidity resides pre-eminently in the bark. The data thus far gathered give as the average acidity of the root sap of citrus trees the figure of 0·83 per cent. Dr. Dyer found that plants belonging to the Rosaceæ and Plumbagineæ orders gave the highest strength of root sap acidity, ranging from two to five and a-half per cent. The general average taken from twenty different natural orders being about one per cent., but it was found that the variations in amount of acidity were wide even in plants of the same order, and even of the same species.

PURE AIR.

WHEN we consider that despite all the pains which we bestow upon the preparation of soils and their enrichment with manure or manurial salts, it is to the unpalpable air around us that we must look for the chief food for our plants, we can easily appreciate that the quality of this food is a very important factor in successful culture. Curiously enough, though the one essential element in the air is precisely that carbonic acid gas which is thrown off by every animal in the act of breathing, and by every fire in the act of burning, the extra supply in the vicinity of towns exercises no appreciable effect as a stimulus to growth, and it is in the pure air of the hills that vegetation is most rampant. The actual addition of this gas to town air is, however, practically a very small one indeed, air at the top of Ben Nevis containing 327 gallons of it to the million, as compared with 380 gallons per million in London streets. This small difference is due to the rapid diffusion of gases, and the fact that big as London looks to man's eyes, and great as is the multitude of exhalers which people it, and the number of fires which burn in it, it is but a small patch upon the bottom of the great aerial ocean which sweeps over it, and to which its quota of contributed carbonic acid is consequently extremely minute. Town air, morever, is laden with many other matters than an extra supply of this gas; coal in burning gives off, unfortunately for plants, another gas, sulphurous acid, which is a deadly poison, and in large manufacturing districts the contributions to aerial muddiness are multifarious in the extreme, and mostly detrimental. The unfortunate plants subjected to this mixed diet, and opening their myriad of leaf pores to imbibe the one essential, are consequently very apt to find that essential gas allied with its poisonous companion, and in any case they speedily become choked with accompanying soot and dust, and thus are starved in the midst of plenty, even if they escape the poisoning process. It is, indeed, seen to be a very marvellous thing, considering the very small propertion of carbonic acid in the air, that it should suffice not only to build up the enormous annual leafage, seed, and timber growth of the world year after year, and century after century, without any appreciable diminution of the aerial store. True it is that animal life, as we have seen, does something to restore the balance, but this only affects the small proportion consumed as food, to which may be added the proportion consumed by fire, plus a contribution from the forests of old, now represented by coal. When, however, we regard the gigantic forests of the world, and the immense amount of wild vegetation generally distributed, and always draining upon the store, and laying up as it were in Earth's bosom, as leaf-mould and peat, the incipient coal beds of the future, we are puzzled to conceive how the equilibrium is really maintained, and an adequate supply kept up.

IS THE CULTURE OF SMALL FRUITS DECREASING?

NOTWITHSTANDING the fact that the agricultural returns for 1897 have been so considerably amplified as to form a somewhat portly volume, the information relating to bush and orchard fruits has been greatly reduced, and the tables giving the acreage of market gardens have been discontinued. These changes appear to us undesirable, and having regard to the importance of market gardening and fruit culture, we trust that in subsequent returns these industries will obtain fuller recognition. We have no longer the tables showing at a glance the acreage of small fruits grown in orchards and in open quarters. The two systems are lumped together, and as the acreage in 1897 only is given, we have to search through the tables containing the whole of the crops grown in the several countries to ascertain whether there has been an increase or decrease as compared with the preceding year in the acreage of small fruits. In examining these tables, we were not a little surprised to find an apparently substantial decline in nearly the whole of the counties of Great Britain, the aggregate being 6,453 acres. We find for example that according to the returns there were decreases of about two hundred acres in Berks, Chester, Dorset, Essex, Gloucester and Notts; of about three hundred acres in Norfolk and the West Riding of York; of four hundred acres in Lancaster; of four hundred and fifty acres in Hereford on nearly one half the area of the preceding year; and of nearly six hundred acres in Kent. As there has been a continuous increase in the acreage during the past ten years, and planters were apparently as active in the planting season of 1896-97 as in preceding years, we turned to the introduction with some degree of interest for the purpose of obtaining some explanation of this remarkable change. Here we found the reduction in the figures was not due to a diminution in the area, but to the use of a new schedule, which it is believed ensures more correct returns. Major Graigie states: "The use of the new schedule has brought to light in somewhat numerous instances, cases where the older entries necessitated a careful inquiry, which showed that there had been in some places in former years a failure by the occupiers to distingush the classes of fruit properly included under this head, and errors were found in many counties in the measurement of the small fruit areas lying within orchards and gardens, but occupied at the same time by fruit-bearing bushes." It follows, therefore, that the apparent total reduction of upwards of six thousand acres is made up of revisions and corrections, and it is surprising steps should not have been taken to obtain a greater degree of accuracy in previous years than appears to have been the case. It is stated that there are instances in the collectors' reports where the discontinuance of fruit growing is noted, and the contraction of area is ascribed to the competition of fruit imports from the Channel Islands, and elsewhere. We have no doubt there has been a contraction in some districts, but there has been an increase in others, and we are fully persuaded that the imports of soft fruits have not had the effect of diminishing the area by a single acre in Great Britain, and that the increase in the actual area was as large in 1897 as in the preceding year. There has of late years been a material increase in the imports of gooseberries and currants from the continent, but they have not been sufficient to appreciably reduce the prices, and it may be assumed that a substantial reduction in values would alone bring about a material contraction of area. The imports of soft fruits from the Channel Islands that can be grown in the open, are so small that they certainly have not influenced prices or the area devoted to them.

New Strawberries formed a remarkably interesting feature of the meeting of the Royal Horticultural Society on Tuesday, and it was satisfactory to have such conclusive evidence of continued efforts in the improvement of the strawberry. Messrs. Laxton Brothers exhibited a large basket of fruit of their new variety, Trafalgar, to which we directed attention in our issue of the 23rd inst. This variety has a strong constitution, is a heavy cropper, and the fruits are large, handsome, and richly flavoured. It has also the merit of being very late, and is, therefore, of much value for maintaining the supply until quite the end of July. Although much has been accomplished by Messrs. Laxton in lengthening the strawberry season, it is yet too short, and it is very desirable that it should be extended by the multiplication of late varieties. Mr. William Allan submitted to the Fruit Committee his new strawberry, Lady Suffield, and that body confirmed the high opinion we expressed with regard to its merits last year. We had an opportunity of seeing the strawberries at Gunton Park a short time since, and, as was the case in 1897, Lady Suffield was bearing a heavy crop. Last year the Fruit Committee were somewhat afraid that the last-named variety was too much like Lord Suffield, but on Tuesday Mr. Allan submitted plants and fruits of both varieties, and the committee was thus able to fully recognize the chief points of difference between them. There is a family likeness, but the two strawberries are perfectly distinct both in habit of growth and in the shape and appearance of the fruit, and they ripen at different periods, Lady Suffield attaining maturity ten days or so in advance of the other variety. They agree in being exceptionally rich in flavour, and Lady Suffield will commend itself to those who regard high quality as the most important characteristic of a strawberry. Lord Suffield is one of the most robust of the highly-flavoured strawberries grown at Gunton Park, and as it is a heavy cropper and rather late it is regarded as of special value. Mr. Allan had just commenced gathering from it when we were at Gunton Park on the 22nd inst., and it will be succeeded by Laxton's Latest of All, of which Mr. Allan has a high opinion.

Weedkiller Poisoning.—In recording a short time since the death of a labouring man from the effects of drinking weedkiller, we stated that it appeared to us almost incredible that anyone should drink liquid from casks met with in the garden. If it was well-nigh incredable in the case of an illiterate working man it appears still more so in the case of a man who has graduated at one of the principal universities in Scotland, and who is described as having been "keenly interested in science. It appears that a few days since the Rev. J. Thomson, minister of the parish church, Arbroath, visited, with his wife, Drummond Castle, for the purpose of seeing the historic castle and the famous gardens, and being very thirsty he drank of the contents of a barrel that he met with in the course of his tour of inspection. It is stated that the barrel containing the weedkiller was placed near the stair leading to the armoury, and that attached to it was an old rusty tap and spigot, while on each end of the barrel was printed the word poison. Notwithstanding these facts Mr. Thomson drank a quantity of the liquid, and in a very short time was seized by violent pains, and suffered intense agony until his death, which occurred on the following day. We cannot understand anyone being so unwise as to drink liquid from a barrel without first ascertaining its character, but seeing that it is done, a point should be made of not only labelling the casks containing weedkiller, but of keeping them, with the vessels used in applying the liquid to the walks, under lock and key.

London Parks and Gardens.—In the course of the annual address on the work of the Council during 1897-8, Mr. T. McKinnon Wood, Chairman of the London County Council, said that the last year had not witnessed the addition of any large park within the county to the possessions of the people, but the committee were able to report that it had secured seven small open spaces and playgrounds in the poorer and more densely-populated parts of the metropolis, amounting to ninety and a half acres in all. The value of these playgrounds for the children of the poor was not to be estimated by their acreage. The Council had, however, assisted in the acquisition of one large and beautiful open space—Churchyard-bottom Wood, Highgate, in future to be known as the Queen's Wood—which, though just outside the county boundary, would doubtless be largely used by the dense population in the north-west of the county, to whom it was easily accessible.

Recent Flora of Great Britain.—The investigation of the geological history of the recent flora of Great Britain has engaged the attention of Mr. Clement Reid for many years past, and the results he has obtained are of much interest. From the recent report on his investigations it is evident that much new information has been obtained during the past ten years. In the table showing the geological range of the various species of British plants which have been found in a fossil state, about one-seventh of our flowering plants are recorded. The orders most strongly represented are mainly those which possess hard fruits or seeds specially adapted for dispersal, and those with deciduous leaves. Mr. Reid remarks that it is doubtful whether a single one of our flowering plants is, strictly speaking, a native of Britain. The whole flora has originated probably in other and various parts of the world. We find many of the species were merely stranded by successive waves of migration, which have brought together a variety of continental forms, some Arctic, some Southern, a few even American. These migrations were, in Mr. Reid's opinion, mainly compelled by climatic changes, though other agencies have played an important part. He thinks it probable that a far larger proportion of our plants was introduced by human agency than is generally believed to have been the case.

Potato Spraying.—The Bill promoted with the object of providing the Irish farmers with machines and materials with which to spray their potatos was read a second time in the House of Commons on Wednesday. In the course of the discussion Colonel Lockwood complained that the Essex farmers had not yet enjoyed similar privileges, and expressed the hope that in the next session the necessary steps would be taken by the Government to provide the farmers with spraying machines. The gallant colonel received the assurance of support from some other Members, and we would suggest that he should go several steps further, and introduce a Bill by which his farmer friends would not only be supplied with spraying machines, but have their potatos planted, cultivated, lifted, and marketed at the expense of the State.

Early Peaches have had a full share of attention given them in the GARDENERS' MAGAZINE, for we have from the first recognized the importance of prolonging the season of these delicious fruits by the introduction of varieties attaining maturity early in the summer. At no time are peaches and nectarines more thoroughly enjoyed than during hot weather, and the fruit of varieties that ripen in July, if not equal in size and flavour to that of the best of those in season in August, is invariably highly appreciated. Our esteemed coadjutor, Mr. W. A. Cook, of Compton Bassett, has reminded us of the value of the early peaches, by sending us two fruits each of Amsden June and Waterloo, which, if not equal in size and flavour to Bellegarde or Noblesse, are large enough to form an attractive dish and sufficiently luscious to satisfy the epicure. Mr. Cook states that he gathered the first dish from the outdoor trees on July 21, and that he finds peaches from the open walls exceedingly useful thus early in the season. This we can readily believe, as they commence to ripen when strawberries are becoming scarce, and in advance of the finest of the dessert plums and the early pears, and are thus available when high-class fruit is comparatively scarce in gardens, where the accommodation for fruit culture under glass is comparatively limited. First samples of the two peaches sent by Mr. Ward have not come under our notice, a point of some interest from the fact that the trees from which the fruits were gathered have produced a crop of about twenty dozen each.

Presentation to Mr. N. N. Sherwood.—At the invitation of Sir William Farmer, the Master, the members of the Gardeners' Company and their friends visited Ascot Place, Winkfield, on Tuesday. Luncheon was served on the arrival of the guests, and on the conclusion of this function the Master expressed the pleasure that it gave him to welcome the members of the company. He then, in a few words, presented Past-Master Sherwood with an illuminated address, as follows: "The Court of Assistants of the Worshipful Company of Gardeners in presenting a past-master's badge to Nathaniel Newman Sherwood, Esq., desire to place on record their high appreciation of his services as Master of the company for the two years 1896-7, 1897-8. His willingness to promote the interests of the company, combined with the genial but firm occupancy of the chair and extended hospitality, has endeared him to his colleagues, who, on his retirement from the mastership, wish him long life and continued prosperity." Mr. Sherwood replied in an equally brief speech, and testified to the pleasure it had given him to preside over so important a company as the Gardeners for two years in succession.

Meadow Saffron (*Colchicum autumnale*), which is much appreciated in gardens for the beauty of its flowers, and forms so delightful a feature of the less highly-dressed parts of the pleasure grounds when planted in the grass, is, by reason of its poisonous properties, highly objectionable as a constituent of pastures. Recently several complaints have reached the Board of Agriculture of the injury done to cattle by it. In one case several bullocks were seriously injured, but recovered when they were removed from the meadow in which it was plentiful. The poisonous properties of the plant has long been known, and in France it bears the popular name of Tue bœuf, or kill-ox. The most dangerous period is from the end of April to the end of May, when the seed capsules have been sent up from the corms or bulbs, and the leaves are in full vigour; and at this season, when animals are first turned out, grass is sometimes very short, and they are most eager for green food, and are more likely to eat the meadow saffron. From the middle of September to the end of October, when the flowers are formed, there is also considerable danger to grazing animals, as at this time the grass is thick and the flowers might be taken up with the grass. This weed, however, has an acrid taste, and it is not very likely that animals would eat it except in eager haste to get green food, or if keep were very scarce, or again if taken up accidentally among thick grass. The bulbs have an unpleasant odour as well as an acrid taste, and would probably be rejected by animals, except, perhaps, hungry pigs. The greatest danger from this weed seems to be from the leaves and seed capsules getting into hay, as in this form its acrid flavour would be modified by the heating process, and if it were present in considerable quantities it might produce serious consequences. The plant should, as far as practicable, be eradicated from pastures, which can be best accomplished by digging up the bulbs, whose situation is easily seen by the flowers without leaves in the autumn, or by the large green leaves and peculiar seed capsules in the spring. An excellent tool is used in France for extracting the bulbs. It consists simply of a rod of iron, enlarged at the end and sharply pointed; about ten inches from the end a moveable claw with three prongs is fastened so that it may fold upwards, and allow the tool pitcher to be thrust into the earth. When the claw is below the bulb the tool is drawn up, when the claw extends and brings the bulb with it.

Chillies and Capsicums.—Pod peppers or capsicums, the fruits of Capsicum annuum and allied species, are a well-known spice and condiment. They are an indispensable ingredient in curries and are largely consumed in the fresh and dried state and in pickles. Some forms of capsicums known as bell peppers are entirely free from the acrid and burning pungency so characteristic of these fruits, and may be eaten cooked as a vegetable or in salads. Chillies, Bird or Guinea Peppers, the fruits of the shrubby Capsicum minimum (usually much smaller than the preceding), grow generally in tropical countries. These are in chief demand in commerce. When thoroughly dried and pounded, and afterwards passed through a hand mill and sifter, they are the principal sources of the well-known cayenne pepper. According to the *Kew Bulletin* it is estimated that about one hundred tons of dried chillies are annually received in this country from the West Indies and the East and West Coasts of Africa. The price at which they are sold appears to be liable to considerable fluctuation. In May, 1898, "fifty bags dull Zanzibar sold without reserve at 29s. to 29s. 6d.: while fifty-eight bags good Japan sold at 39s. to 41s. per cwt." A sample of capsicums grown at St. Lucia in the West Indies, dull and uneven in colour, were valued (in February last), in limited demand, at 20s. per cwt. What is evidently required is an article bright in colour, even in quality, and possessing great pungency.

Strawberry Ground Beetles.—A considerable proportion of our readers are fully acquainted with the mischief which has been caused of late years to the ripe and ripening strawberries by the ravages of what are known as "ground beetles." There are four kinds of these beetles, very much alike in appearance, as they are all of a brownish or blackish colour, with long legs and horns, but varying in size from about half-an-inch, or less, in length, to a good deal over that [illegible]. The commonest, as well as the most objectionable kind, on account of the possession (and also willing use) of ample and strong wings, is the species scientifically known as the Harpalus ruficornis. The injury is caused by the beetles eating out pits of greater or less size in the fruit, also spoiling the surface of the fruit in patches, by the action of their jaws, and by removing the seeds, which may be found lying in quantities on the ground beneath the attacked fruit. Various methods of getting rid of the pests, including a moderately successful plan of trapping by placing pieces of flesh (these beetles being also carnivorous) in the beds and clearing these baits daily, have been tried, but some more generally available method of dealing with the attack was greatly needed, and the following note of successful treatment with which Miss Ormerod states she has been favoured by Messrs. Laxton Bros., of Bedford, appears to me to be such a great advance, that she has requested, and been kindly favoured, by their permission to make it public. Messrs. Laxton wrote on the 19th inst. as follows: "We are pleased to be able to report that we have almost entirely destroyed the beetle pest, which played such havoc with our strawberry crop last season. We purchased a large quantity of cheap pudding basins early this spring. These we let into the ground level with the surface at distances of a few yards apart, and kept them baited with pieces of lights and sugar water. When the weather was dry, we often caught half a basinful of a night, until the number gradually diminished to two or three, and now none at all. It is a laborious process, but well worth the trouble, as we have lost no fruit this season." Another plan of treatment which has succeeded well on the much smaller scale of private garden culture has been communicated to Miss Ormerod by her friend and neighbour the Rev. J. A. Cruikshank, of Sandridge, near St. Alban's. The ground amongst the strawberries was (as is customary) covered with straw, which has been noticed as much approved of by the beetles as a shelter to their haunts beneath. The plan adopted by the gardener was to put the straw aside over a piece of the bed, and then trowel in hand turn over the surface of the earth from which the straw had been temporarily removed, and secure the sheltering beetles, and then replace the straw. Thus gradually, in this way, going over the bed the beetles were captured by hundreds, and whereas the first part of the crop was ruined, afterwards, when this plan had been carried out, the fruit was saved from further ravage. "This beetle pest has become such a serious trouble to strawberry growers," observes Miss Ormerod, "that I have much pleasure in submitting the above methods of prevention, in the hope of doing something towards checking its ravages."

Hampstead Heath Extension.—It is gratifying to learn that the fund for the acquisition of the Golder's Hill Estate now stands at £37,000. About £4,000 is still required, but the committee in charge of the scheme are confident they will be able to hand the park over to the County Council in August.

An Earl on Gardening.—The recent Kenilworth Flower show was opened by the Earl of Clarenden in the grounds of Kenilworth Castle, and at the ceremony the noble Earl remarked that he could remember the time when not only the peasant in his cottage, but the monarch in his palace, were absolutely satisfied with the rose and the tulip, intermixed perhaps here and there with a few geraniums and a little verbena. Now-a-days nobody was satisfied, at all events, the monarch in his palace was not satisfied, unless he had a carnation the size of a soup-plate and roses all the year round. He thought that all this was a good sign, as refinement of cultivation and appreciation of the beautiful in Nature led to refinement in other things. He felt confident that the association with, and the cultivation of, what was lovely and loveable in Nature not only softened the character, but also produced its influence in every profession, pursuit, pleasure, or form of business which they might take up in life. It was gratifying to find how great an increase there had been in the cultivation of vegetables during the last twenty-five years. When they remembered the thousands of tons of vegetables that were imported from foreign countries, it seemed a pity that labouring men could not grow vegetable products to a much greater extent in their own gardens and allotments. If fruit and vegetables were to be grown for sale, however, they must be made to look attractive. As it was, fruit was often picked in an immature state, and was carelessly packed, so that it was delivered into the market in an unsound condition.

A New Treatment of Sewage.—Acting on the belief that the complete destruction of pathogenic microbes cannot be insured by their natural enemies in sewage, Mr. P. S. Hyslop, M.Inst.C.E., Walmer, has devised a means of effecting this aim by the addition of calorific sterilization to bacteriological treatment of sewage. He has also modified the usual system. The settling tanks are subdivided into cells, which again have baffle-plates so arranged that the sewage must pass down a restricted passage, near the foot of which it meets with an upward current of air emitted under pressure from a pipe suspended from the top, so that aeration is under direct control. A supply tank is fitted so that, with the usual variations in the strength of the sewage, the air supply may be increased easily. The sewage passes under the baffle into the larger division of the cell, rises and flows through a restricted passage into the next cell, and thus successively through the several tanks, the solid matter being deposited in pockets formed for its reception. It is suitably drained, removed, dried, and burned. The next and distinctive treatment in the process is the passing of the liquid, after the usual admixture of alkali, through heat exchangers, in which it cools and is itself heated by liquid previously operated upon. The heat exchangers communicate with disinfectors or sterilisers of the vertical cylindrical form, having a helical partition. The liquid enters at the bottom of the vessel, and by the actuation of steam jets is heated and propelled through the helical passage to a vessel at the top fitted with a pressure-regulating valve. The liquid finally passes through passages under a sludge-drying platform into a settling tank, and thence through filters. According to *Engineering*, Mr. Hyslop dispenses with circular pipes in the heat exchangers, so as to minimise the hydraulic mean depth, and keep the particles of liquid as close to the wetted surface as possible. The heated liquid from the exchangers is used for drying the sludge. The ammonia and other gases expelled from the liquid during sterilisation are collected and led through a saturator, in which the ammonia is absorbed by dilute sulphuric acid, the residual gases being passed into the foul gas conduit. The saturated sulphuric acid is conveyed to an evaporating chamber and suitably treated. Mr. Hyslop estimates the coal expenditure at £50 per day for the treatment of 4,800,000 gallons of sewage, with fuel at 12s. per ton. A plant for dealing with 200,000 gallons of sewage per hour, delivered to the station in a low-level sewer, from which it has to be pumped up fifteen feet into the treating tank, is estimated to cost £35,000, exclusive of land, of which about one acre might suffice.

NEW PLANTS, FLOWERS, AND FRUIT.

LÆLIO-CATTLEYA INGRAMI GIGANTEA.

THIS is a glorified form of an already popular hybrid orchid, obtained by crossing Lælia pumila with the beautiful Cattleya Dowiana. Though the plant seems no stronger than is the type the flower is of larger proportions, and of a lovely rose-purple colour with crimson-purple lip. F.C.C., R.H.S., July 26. Messrs. J. Veitch and Sons, Chelsea.

LÆLIO-CATTLEYA SCHILLERIANA, CAMBRIDGE LODGE VAR.

This is a handsome form of a distinct section of the variable Lælio-cattleya elegans. The sepals have reflexed margins, and are very pale rose; petals broader, palest rose, with violet veins. Lip very rounded and beautiful, richest purple, suffused with violet; throat almost pure white. A charming and distinct form. A.M., R.H.S., July 26. Mr. J. Chapman, gardener to R. I. Measures, Esq., Cambridge Lodge, Camberwell.

MASDEVALLIA IMOGEN.

A curious little orchid, yellow on the outside of the somewhat small flowers; deep crimson and scarlet inside, with an abundance of tiny purplish dots that produce a most pleasing colour; tails orange-coloured. This orchid is the result of crossing M. Schlimi with M. Veitchi. A.M., R.H.S., July 26. Messrs. J. Veitch and Sons, Chelsea.

ARUNDINARIA ARISTATA.

A tall slender growing bamboo, loosely branched and carrying an abundance of beautiful light green leaves; the branchlets are whitish-green and the young foliage is covered with a kind of bloom that makes it very handsome. About seven to eight feet high, F.C.C., R.H.S., July 26. Mr. J. Garrett, gardener to A. B. Freeman Mitford, Esq., C.B., Batsford Park, Moreton-in-the-Marsh.

PHYLLOSTACHYS FULVA.

Very slender in growth and with its branches divided into by branchlets that bear three or four leaves each. The latter are narrow, acute, and of a lovely deep green hue. A very handsome bamboo. F.C.C., R.H.S., July 26. A. B. Freeman Mitford, Esq., C.B.

ARUNDINARIA METALLICA.

A dwarf growing bamboo with stout canes that carry about half-a-dozen leaves towards the apex; these spread out, are deep green, with very pale mid-rib, an inch and a half across, and six to nine inches long, acutely pointed. A sturdy new Japanese plant. F.C.C., R.H.S. A. B. Freeman Mitford, Esq., C.B., Batsford Park.

ARUNDINARIA NITIDA.

This is a beautiful bamboo and one of the most graceful and shapely; it has tall, very slender growths, the stems being black and the small and narrow leaves a bright green, the growths being much branched and heavily clothed with foliage, so that they bend gracefully. A most handsome plant for any purpose. F.C.C., R.H.S., July 26. Messrs. J. Veitch and Sons, Chelsea.

ARUNDINARIA VEITCHI.

This is a fine hardy bamboo somewhat intermediate between A metallica and A. palmata, dwarf in habit, with broad foliage that is glaucous on the reverse side. F.C.C., R.H.S., July 26, Messrs. J. Veitch and Sons, Chelsea.

CARNATIONS.

Isinglass, a grand carnation of large size and with very broad rounded petals of a rich and deep scarlet hue; one of the finest of carnations either for pots or open-air culture. A.M., R.H.S., July 26. Mr. C. Salter, gardener to T. B. Haywood, Esq., Reigate.

Lady Sophie, a pretty carnation with large bold flowers of a pleasing salmon-red hue tinged with rose. A.M., R.H.S., July 26. Mr. Tapper, Sundridge Park, Kent.

ROSES.

Souvenir de Madame Levet is a beautiful semi-double, deep yellow tea rose, very free, beautiful in the bud, dwarf in growth, and deliciously fragrant.

Charlotte Guillimot is a soft whitish, hybrid tea rose with imbricating broad petals that have reflexed upper edges. A.M., R.H.S. to each, July 26. Messrs. W. Paul and Son, Waltham Cross.

NYMPHÆAS.

N. odorata rosacea.—A lovely soft rose-pink variety, with rather narrow petals, and a rich yellow centre of large stamens.

N. gloriosa is a magnificent water lily of a very bright hue and large size; the flowers are bold and full, the petals being of a beautiful crimson shade suffused with rose. F.C.C., R.H.S. to each, July 26. Mr. James Hudson, gardener to Leopold de Rothschild, Esq., Gunnersbury House, Acton.

BUDDLEIA VARIABILIS.

A distinct species and quite hardy, bearing long narrow spikes of lilac flowers; the latter are small, and have an orange eye, and look much like tiny verbena flowers. The spikes are about eighteen inches long. A.M., R.H.S., July 26. Messrs. W. Paul and Son, Waltham Cross, Herts.

PELARGONIUM ACHIEVEMENT.

A novel and useful pelargonium, and one that, considering the distinctness between ivy-leaved and zonal varieties, might almost be called a hybrid. It has brilliant salmon-red flowers of large size, borne in shapely and full trusses on sturdy plants. It is the result of crossing a single white, seedling zonal variety with the well-known ivy-leaved pelargonium, Souvenir de Charles Turner, and is in every way an achievement. It makes a fine bedding variety. A.M., R.H.S., July 26. Mr. H. J. Jones, Ryecroft Nursery, Lewisham.

RIVERS' EARLY TRANSPARENT GAGE.

A beautiful plum and as finely flavoured as beautiful. It is of good size, transparent yellow in colour, tinged with orange and dotted with brown specks on one side. A lovely bloom covers the whole fruit; roundish in shape. F.C.C., R.H.S., July 27. Messrs. T. Rivers and Sons, Sawbridgeworth, Herts.

EARLY RIVERS' CHERRY.

A monster fruit as shown by its raisers, fleshy, sweet, and a famous dessert variety either for indoor or outdoor culture. It is a handsome, lustrous, black cherry. F.C.C., R.H.S., July 26. Messrs. T. Rivers and Sons, Sawbridgeworth.

RASPBERRY GOLDEN QUEEN.

A fine, large-fruited, pale yellow raspberry with elongated fruits, solid, sweet, and of pleasant flavour. This is a good cropping variety, and keeps and carries better than most. A.M., R.H.S., July 26. Messrs. J. Veitch and Sons, Chelsea.

THE ROSE SEASON OF 1898.

THE difficulties with which the path of the rose grower are beset have seldom been as numerous or so keenly felt as during the past two months. The plants passed uninjured through the winter, and the shoots when cut back in March were all that could be wished, being sturdy and well-ripened; and owing to the cold spell at pruning time there was no bleeding. These March frosts, however, did a good deal of damage to the young growths of many of the so-called "garden roses."

In due course the usual number of grubs and caterpillars made their appearance. Then came such persistent attacks of green-fly as we, rosarians, have seldom had to contend with; then mildew, then drought and drying winds, which are far more hurtful than any rain, bringing with them, among other things, thrips, to disfigure the delicate blooms of the teas. But the distinguishing feature of the rose season of 1898, and the cause of most of the above-named troubles has, no doubt, been the unusual number of cold nights. For instance, during the first three weeks of the present month, usually the warmest of the year, my thermometer exposed on the lawn has on five nights registered temperatures within four and six degrees of the freezing point.

Notwithstanding all these drawbacks, roses have been this season, on the whole, good, especially the light coloured H.-P.'s. The fact is, the plants began the year with grand blooms, as it were, in them, but the adverse weather conditions would only allow of their producing flowers of rather more than average quality, and that only for a short period.

A great deal has been said about the lateness of the season, but I do not think myself it will be found on examination to have been as exceptionally late as generally supposed. In the first place, our ideas have, no doubt, been upset by the previous series of early rose seasons, while the long shoots which many of the crimson H.-P.'s threw up this year have also served to make the present one appear later than it really was. At the time of writing (23rd inst.) my plants of Marie Baumann and A. K. Williams are not even yet in full flower. That the season has been unusually late is evidenced by the three exhibitions of the National Rose Society. Their first show, which was held at Bath, on June 24th, proved the smallest southern exhibition yet held by the society. The total number of blooms in the classes for hybrid perpetuals, hybrid teas, and teas and noisettes, was only 1,180, or less than half the usual number. The Metropolitan Show, which took place at the Crystal Palace, on July 2nd, was a decided improvement, the aggregate record amounting to 5,790 blooms, or about the average number for this exhibition, taking the five previous years. The Northern Show was held at Halifax on July 14th, and was undoubtedly, all things considered, the finest rose show of the year. There the number of blooms amounted to 4,100, making it, with the exception of Birmingham in 1890, which was slightly more extensive, the largest exhibition ever held by the society in the north. No fewer than 20,000 persons are said to have visited this show. The attendance of visitors, both at the Crystal Palace and at Bath, was also unusually large. Throughout the season, the trade exhibits have been, in many instances, remarkably fine, while those contributed by the amateurs, with certain exceptions, fell, I should say, somewhat short of their ordinary standard.

The character of the season is also shown in other ways by these three exhibitions. For example, a noteworthy feature of the Bath show was the presence of only one exhibitor, Mr. Burrell, from Cambridge, hailing from any locality farther north than Oxford. Then at the Crystal Palace one could not help noticing the large proportion of early flowering varieties in almost every stand. While at Halifax, notwithstanding its great distance from London, there was an unusual number of exhibits from the southern, eastern, and south-midland counties of England. New seedling roses were also a striking feature of that show, whether we consider their number, high quality, or the condition in which they were staged. Indeed, I cannot call to mind any previous occasion when they have been as well represented.

EDWARD MAWLEY.

Berkhamsted.

DICTAMNUS.

THE genus Dictamnus is among the most showy of hardy perennials, and whether in or out of flower, is most decorative. It is not adapted for cutting, however, owing to the sticky nature of the stem, and strong smell of the plant. As Dictamnus are very slow growing, and do not like to be moved except when still small; it is best to give them as nearly as possible a permanent place, either in the herbaceous border, on the top of a rockery, margin of shrubbery, or as specimens on the lawn. The best time for planting is early spring or during the winter; a sunny, well-drained, loamy or chalky soil being the most preferable rooting mediums.

D. Fraxinella, when fully grown, usually attains a height of two feet; the leaves are pinnate with ovate-lanceolate leaflets slightly serrated and slightly glandular, the stalks and stem being sticky. The flowers are in erect racemes, the five petals being of a pale rosy-colour veined red or purple, produced in May, June and July; the species is from northern Europe, but nowhere commonly found. D. Fraxinella var albus is a form with milky white flowers; this is more often seen under cultivation than in its native haunts, although it is quite as prolific and vigorous, and usually comes true from seed. D. Fraxinella var caucasicus is the best of the set, and differs from the typical D. Fraxinella in having much larger, deep green leaves; the stem attains under favourable conditions a height of four to five feet. The flowers are also much larger and of a deeper colour, expanding a week or two later than D. Fraxinella. The curious fact about this form is that while the plant from the more western part of the Caucasus is identical with that of northern and central Europe, the larger form is very local in the eastern Caucasus. There is also said to be a white flowering form of this Caucasian variety.

G. REUTHE.

MY FERNS.

As the persevering raiser of plants on systematic lines is fairly sure, in course of time, to be rewarded by something new which he can call his "very own," as it were, I am bold enough to hope to touch a few sympathetic chords among the readers of the GARDENERS' MAGAZINE by striking a purely egotistical note, and detailing my own particular successes in the British fern way. The British fernist, however, has one great advantage over the selective grower or collector of plants generally, inasmuch as his efforts are not confined to the improvement of types already existing in cultivation, since, as a successful fern-hunter, he may find new types for himself among the wild and common forms, and thus swell his collection in two distinct and interesting ways. Clearly the original finds rank first in interest, since in these we have the raw material already fashioned by Dame Nature's hand into some novel, beautiful, or curious type, through some inscrutable creative influence which so far baffles all theory. These in all cases form the cultivator's starting-point. With flowers—to take, say, the cyclamen as a typical case—the wild form of an exotic species, beautiful enough in itself to repay culture, is introduced, and propagated for years in its normal form. Then the alert grower perceives a better form in a seedling, and, starting from this "break," little improvements are accumulated until a small reflexed bloom is transformed into a huge one. Then the form itself "breaks," and at length large flat flowers with fimbriated petals four inches across, or varieties with crested surfaces, are arrived at. With our native ferns, however, in the midst of a clump of the absolutely normal type the hunter may find a plant which at one step, so far as he can tell, has varied quite as much from the common as the best cyclamen has in scores of selected generations, and no authenticated instance is recorded where an abnormal type of British fern has originated from sowings of common spores. In this particular direction, then, the fernist, strolling round his pets and taking stock, as I now propose to do, works hand in hand with Nature's sylvan forces, and counts among his "gems" not only those of, maybe, more delicate cutting due to selection, but also the spontaneous miracles embodied in the original finds themselves.

Taking my finds, then, as they come, the first that strikes my eye is Athyrium f.-f. cristatum Kilrush, pinnæ and frond tips divided over and over again into long ornate stiff tassels; a thoroughbred. This carries me away to Shannon shore in Co. Clare, and I see myself threading my way along a dry drain cut through a plantation, its sides lined with Blechnum spicants, while overhead a tangle of the common bracken all but bars my progress, to say nothing of intrusive brambles. I am now blechnum hunting, but a half-heard remark from a youngster, who is my guide on this occasion, induces me to push the bracken aside to hear the better, and, lo! in the very gap thus created is my find, a tiny crested plant, but tasselled all over. A thorough search all about fails, as usual, to result in a duplicate. This was in the first half-hour of my hunting in that locality, but a subsequent search failed to match the find. Close by, in my fernery, I perceive another acquisition from this district, Lastrea f.-m. cristata Kilrush. A drenching Sunday relentlessly imprisoned me the whole day, but in the evening I strolled down the road into the [illegible], a road lined with a low wall of mud and stones and devoid, apparently, of any vegetation whatever. A solitary ragged fern frond in a chink of the stonework strikes me as curious; it is only a seedling, but the tips are curly, as if they would close if they could. A few yards further on, a clump deep in a crevice has a few tattered fronds, and these are unmistakably tasselled, and are bagged accordingly. Beyond these two plants there was not a fern in the dyke. L. dilatata polydactyla Clovelly transports me to Devonshire—scene, the Hobby Drive; stern injunctions against fern vandals bristle all around. Below, through a gap in the trees, my wife and I are watching the steamer come in, and behold half way down the fern-clad slope at our feet my eye detects a tassel, and Lastrea dilatata polydactyla is found as a beautiful full-sized specimen. Here is a quandary for an enthusiastic fernist, a rare find—for L. dilatata sports but little—and a veto! Solution: the spores are ripe, a pinna picked and carefully consigned to my purse, and subsequent patience gives me my find at home, and in capital form. Close to this is another souvenir of the west from Exmoor's wilds; a long and fruitless hunt through a long and glorious day, crowned at the last moment by B. spicant concinum Drueryi, found in a chink in a stone dyke at Simonsbath, the centre of the moor. On the very point of returning, a native sitting on the corner of the inn parlour, and hearing of our non-success, remarks, "There's a zoight of ferns in a dyke up yon," and one of them was this little gem, each frond a string of emerald and scallop shells. An inch-long tip protruding from a bunch of common seedlings, traced to its source, reveals six true and typical fronds, and these, carefully disentangled from the ruck, prove to emanate from one centre, establishing the integrity of the frond.

Yonder is another finely crested male fern, Lastreat f.-m. polydactyla Druery. Three miles out east of Kilmarnock town, a spare hour snatched before starting for the further north led me to a roadside copse, in which, among hundreds of common ones, was found the parent of this—a gem of first water being Col. Jones' verdict when he saw it. Next season [illegible] of first water fitted it better, for it went all to pieces and has never recovered its form. One seedling, however, after repeated sowings, yielded me the constant type exactly as found, so here we have had to aid Dame Nature by selection to perfect an imperfectly established "sport." Now we come to Scol. v. corymbiferum Lidford, found in a hedge there by the main road side, and then bearing a bunchy moss-like crest, which led to its name, though now its tassels are broad and flat and beautifully [illegible]. Near it is one of my literally biggest finds, a part of the huge plant of the tasselled lemon-scented fern I found on Dartmoor (Lastrea m. [illegible] gracile Druery), a plant so large I had to charter two men and a horse and cart to get it to my lodgings. Fronds and pinnæ slender, and having delicately cut tassels, stamp this as one of the best as well as one of the biggest. Scotland comes again to the fore with my curious A. f.-f. revolvens, frond and pinnæ curled ringlet fashion. Another stroke of luck; all but confined to the house with a sprained ankle, acquired on a holly fern expedition, I just manage to hobble a few yards up an adjacent glen, and find this beauty at a place I had passed a score of times on my way to fernier and more distant fields. Its neighbour was also a curly lady fern, but had enormously long stalks, and three-cornered fronds (Athyrium f.-f. deltoideum). This, too, is Scotch, and curiously enough was found within half a mile of the last. Scotland, indeed, has been kind to me, for here is another lady, A. f.-f. mediodeficiens, but rather a "curio" than a beauty, since the middle of frond and pinnæ is like the Irishman's old coat, chiefly made of fresh air.

Ireland, as we have seen, has conferred some gems, and amongst them I count a little confluent blechnum not yet named as one of the "flukiest" finds of all. A party of us passing through the Gap of Dunloe at Killarney become separated, the majority getting far ahead. I and another make a bold short cut in a bee line down the hillside at full speed, and yet this blechnum catches my eye in the midst of the race. I get it home, it dies, and bitter lamentations result. Two years after, calling on a friend at the Lakes, I see a similar plant in fine form, resulted from a division sent to him by me at the time, but forgotten, a fact which embraces a moral. Here in a pot is a charming little plant of the common bracken, but built ringlet fashion like A. f.-f. revolvens and named accordingly. This is raised from spores from Windermere, where this lovely fern lines the road on both sides for a hundred yards and more on the route to Boness, but still a find of mine, since nobody had remarked its special beauty. Here a tasselled hartstongue carries me to Guernsey, and there two polypodies bring Minehead and Killarney back to mind, the first a bipinnate form, and the second with long attenuate pinnæ. The above list embraces the best of my personal finds, but looking round I see a dozen or more distinct things enough, each of which has its pleasant memory attached to it. Leaving the "finds" proper and coming to "selected" offspring, I am, of course, confronted mainly by that beautiful strain of plumosums yielded from the Axminster Lady Fern and culminating in A. f.-f. plumosum Drueryi and A. f.-f. superbum percustatum, but as I have already dealt with these *in extenso* in these columns I will spare my readers a further infliction. I must, however, mention two successful crosses, one of A. f.-f. percustatum Cousens with the Kalothrix plumosum, and the other, my latest acquisition, A. f.-f. p. Cousens with my own Scotch find of A. f.-f. revolvens, involving a charming combination of tasselled ringlets, and constituting quite a new fashion for the ladies of the fern persuasion. I conclude with a renewed apology for the egotism, a little more accentuated than usual, perhaps, which pervades this paper. There is inevitably a good deal of individuality in a "hobby," and my object has simply been to emphasize how much purely personal pleasure and reward may result from the particular hobby of the British fernist. CHAS. T. DRUERY, F.L.S., V.M.H.

THE APPLE CROP.

ACCORDING to reports which I have been favoured with from various sources the apple crop is not such a generally good one as was at one time anticipated. This is much to be regretted, as the prospects were of the most promising description, and people were not slow to prophesy that apples would again be very abundant, and had such hopes been realised there is no doubt that the crop would have been one of the heaviest on record. Taking the country right through it is to be feared that the crop will not be more than half of what it should be, and if districts were to be taken individually doubtless there are many in which a great scarcity of this popular fruit will be felt this season. So far as this immediate locality is concerned there is but little room for complaint, the exceptions being a few orchards here and there in which the crop will be but a partial one. Vintage fruits will, I think, be plentiful, especially the Hereford Seedlings, which are better known under the name of Normans, with the prefix red, strawberry, &c. This is a vigorous, hardy race, and it is but seldom that they miss bearing, while the majority make excellent cider.

Among table fruits King of the Pippins appear to be plentiful, as I have seen a number of heavily laden trees quite recently, and trees of Blenheim Orange are also bearing much better this year than last. I have also seen standard trees of Warner's King, Ecklinville Seedling, Cox's Pomona, Worcester Pearmain, Lord Suffield, and other sorts, carrying excellent crops of fruit, and looking as healthy and vigorous as one could wish. In these gardens the crop is most satisfactory, and the aggregate yield will be a heavy one. To give a list of all the sorts in bearing would take up too much valuable space, but among them may be mentioned Seek No Further, King of the Pippins, Cox's Orange Pippin, London Pippin, Ribston Pippin, Old Pippin, and Franklin's Golden Pippin, Worcester, Hereford, and Lamb Abbey Pearmains, Nonpareils in variety, Duchess of Oldenburgh, Maltster, Cox's Pomona, Annie Elizabeth, Warner's King, Stirling Castle, Ecklinville, and Pott's Seedling, Land's Prince Albert, Cellini, Tower of Glamis, Wellington, Greenings in variety, &c.

The fruit is clean, and under the influence of the recent hot weather is growing apace. The trees have also made excellent growth, and have just been summer pruned. Insects have given but little trouble, and with the exception of American blight, which is unusually persistent on a few trees, they are quite free of pests. A good rain would do an infinite amount of good, as the ground has become exceedingly dry. If rain does not soon fall moisture will have to be supplied artificially, and this is a heavy undertaking. So far the drought is not of such a serious character as it was at the same period in the past and previous years, nevertheless, the fact remains that not only garden, but also farm crops, stand sorely in need of a steady, soaking rain.

Stoke Edith Gardens. A. WARD.

MORE ABOUT LICHENS AND MOSSES.

As food plants mosses and lichens are also of importance. All are familiar with the fact that the reindeer live altogether on the moss of that name during the long northern winters. The vast herds which depend exclusively upon this humble plant for support give us an exalted idea of the importance of the smallest plant in nature. Linnæus says nothing flourishes so luxuriantly as this in the pine forests of Lapland, the surface of the soil being carpeted with it in places for many miles in extent. If by any accident the forests are burnt to the ground, in a very short time the lichens reappear with renewed vigour. The Laplanders, and many of the Norwegians, make a kind of bread with the lichens, upon which they subsist in the winter; and the Icelanders beat up the cetraria, or Iceland moss, sold in this country in a medicinal form, into a cake, and eat it with milk, thus, as they say, "making bread from the stones." A lichen called "Tripe de Roche" is much esteemed by the Hudson's Bay hunters, and it is mentioned that the deserts of Asia produce lichens in large quantities, upon which the Nomadic tribes at times depend wholly for support. Lichens were formerly of very great importance in medicine.

Together lichens and mosses are the pioneers of vegetation. Is a rugged, barren rock to be clothed? The pulverulent lichen goes first, fastens on the sterile surface, gives it its first coat, then the foliaceous lichen appear, then the liverworts, and in succession the mosses. These then decay, are torn, perchance, by a mountain torrent, or a shower of rain, from their site, and, mixing with the other detritus borne down, a nucleus of soil is formed. Now let wind-carried or water-borne seed be intercepted or fall here, the second step is taken, and thence the progress continues till, in due course, the place is decked with flowers and adorned with trees. Time brings fresh arrivals, every tempest new plants, soon zoological immigrants arrive, and eventually man—the once barren rock has now become a fertile and inhabited island. "The lichens," says Sir J. Hooker in the "Botany of the Antarctic Voyage," "form a large portion of the vegetation of Keynalen's Island to an altitude of 1,500 feet; the rocks are apparently painted with them. At the tops of the hills they assume the appearance of miniature forests, some of them being like little oak trees." Scoresby, in his travels, says he found lichens in abundance on the wildest rocks. St. Vincent found them luxuriating on the volcanic rocks of the Isle of Bourbon, and Darwin states that at Iquique, in Peru, he saw nothing else for fourteen leagues but yellow lichens. The first green crust on the cinders of Ascension consisted of minute mosses; they form more than a quarter of the flora of Melville Island, and the lifeless soil of New South Shetland is covered with specks of mosses struggling for existence. Club mosses entered into the coal strata; Brogniart says mosses formerly reached eighty feet high with proportionate trunks. They have now dwindled down to a few inches. This is a curious fact, due, perhaps, to climatic changes through many ages. In the economy of man perhaps lichens and mosses may appear to play but an insignificant part, but in the economy of nature how great and vast an end is theirs! WM. NORMAN BROWN.

LILIUM HARRISI IN AUTUMN AND WINTER.

THIS lily is so valuable to those who have much furnishing and for the decoration of plant houses that I need not dwell upon its usefulness, as the great numbers that are grown prove that this is appreciated. On the other hand, the value of the flowers in the autumn months is not so well known. I use the term autumn-flowering bulbs in a wide sense, as there is no difficulty in keeping flowers for Christmas. At least, such is my experience of the bulbs. The plants, when in growth, can be retarded at the start, but by autumn the flowers may be had in quantity in September, October, and November by growing the bulbs specially for the season named. I have heard objections raised to autumn-flowering plants of Lilium Harrisi on the ground of the flowers being smaller than the earlier flowers of the same variety, and I admit such is the case, but the smallness or shortened tube of the flower, in my idea, is a gain rather than a loss, as the flowers of the autumn bulbs are more symmetrical and quite large enough for all purposes. Indeed, for wreaths or crosses for church decoration I prefer the shortened flower tube, and the petals are, in my opinion, shorter, so that they last longer, but this latter may be owing to the different season in which the plant blooms and the difference in the shape and growth of the African-grown bulbs.

The Bermuda or early flowering variety, is recommended for Easter decorations, but, as is well known, to obtain flowers in quantity at that date the bulbs must be forced, and there must be no delay at starting. I mean the earliest imported bulbs must be secured, and as these are made a speciality of, they are readily obtained. I prefer the bulbs grown with as little forcing as possible, as I find them most useful for cool house decoration. Having a good space for these flowers, they are most valuable mixed with Canterbury bells in pots in June, and in July with campanulas. The delicate tints of these latter flowers harmonize well with those of the lily. On the other hand few flowers are more useful for corridor or room decoration mixed with palms and ferns, their purity being seen to great advantage. With summer flowering bulbs there is one great drawback; few plants are more subject to the attacks of green fly, and even in cool houses it is well to keep a sharp look out to prevent the insect injuring the flowers. On the other hand autumn flowering plants are less subject to the attacks of the pest named if they are grown as cool as possible, and for latest supplies we do not start under glass, but grow in the open from the commencement.

Now is a good time to secure African grown bulbs for autumn and early winter flowering. The purchaser who buys for the first time must not be disappointed if the bulbs are much less in size than the Bermuda bulbs, as they are naturally smaller, but it is surprising what a fine spike of bloom such small bulbs will produce, and we usually pot three bulbs in a seven-inch pot. For decoration it will be well to put up the bulbs singly in five-inch pots for special purposes. In potting, I would add, it is advisable to press the soil as firm as possible, and as the time in which the plants make their roots is short, good compost is needed. We use a good loam, adding dry cow manure, which is passed through a coarse sieve, and a liberal quantity of bone meal. Such aids as leaf soil, spent mushroom manure, may be employed to advantage. As regards the time of potting, so much depends when the flowers are needed and what they are like when received. We have kept bulbs for weeks in a cool shed previous to potting up if growth was not active, but it is not well to retard by keeping them out of the soil after they are growing as it would be better to retard later when in growth, as this can be done by keeping them cool and shaded when they are showing their flowers. For September blooms we pot up at this date, that is, as soon as the bulbs are received, and plunge in fine coal ashes, and place quite six inches of ashes over the pots; this keeps the bulbs cool till roots become active, and to avoid heavy rains we place in frames, so that the sashes may be removed in fine weather.

The plants are ready to remove from the ashes in six weeks' time, and may be grown in the frames merely protected from storms, but syringed overhead twice daily to keep clean, and to have good colour in the leaves. The culture need not be dwelt upon, it is so simple, but for later bulbs we pot up and plunge under a north wall, giving plenty of plunging material, and grown thus the flowers will be later, and by keeping as cool as possible it is a simple matter to have flowering bulbs in November and at Christmas; for these later dates our plants are placed in frames, just free of frost, late in September, and given air on all favourable occasions. It may be that a large percentage of the bulbs may turn in before the last-named date, but by careful management we found no difficulty in getting late flowers, but even in October and November these useful flowers are of great assistance for cutting or decoration, and the bulbs are not costly.

Syon Gardens. G. WYTHES.

THE DROPPING OF FRUIT BLOSSOMS FROM DROUGHT.

"LUX" is such a genial opponent that it is almost more pleasure to differ with him than to agree with less amiably moulded folk. I also owe him a double debt from keeping me so far clear of Peter's sledge hammer blows. But this week I feel specially tender to Peter, as his style so vividly reminds me of an old faithful servant, a friend of my own. The "blamed varmint," &c., is very redolent of East Anglia, but Peter's answer is likely to prove a poser to others as well as "Lux." I claim the pleasure of repeating it, not in malice, nor for exact endorsement, but because it would seem rude to flatly contradict Peter on a matter of solid fact when he boldly affirms that the drooping flower or fruit blossoms would have stiffened up all right if the "blamed varmint" would have let them. He'd known them do it many a time.

As to the saturating spring that "Lux" writes so vividly about, that you can almost hear the rain rushing in torrents through the flooded root runs, "Lux" will no doubt be surprised to hear that we have had all too little rain in the North. In fact, until Sunday and Monday, July 17 and 18, we have been living for months in fear of a water famine, and with many of our mains full only for a short time, while our rainfalls is still lagging behind the average. Hence "Lux's" facts do not fit here. But I respect "Lux" too much to put him aside with this answer, though it is a sufficient reply to the case as he stated it. It is, however, by no means as certain that, had he had a dry summer or spring, he would have admitted that the drought at the roots shed his blossoms. But no one knows better that drought at the roots may arise from other causes than a deficient rainfall. It is equally true that even heavy rains do not always reach the roots. More than this, the rains that sink to the roots do not always stay long enough to supply their wants. Excessive drainage, or porousness of strata; too restricted areas; over-cropping; hard, unclothed, unmulched, and bare surfaces, may all lead to dryness, or its equivalent, exhaustion, at the roots. Whatever favours these produces weakness of vital force and function, and enables fruit trees and other plants to lighten their loads through throwing off a part or the whole of their current year's crop. It is here that Peter's theory about the varmints comes in. These not only arrest the vital functions of the leaves, but suck the blossom dry of sap, and either bodily devour the blooms or embryo fruits, or starve them off. Hence the flowers have small chance of stiffening up or righting themselves in their contest with the aphis.

The vital importance of this question must be my excuse for one sentence more. Extreme dryness at the root is the normal condition in not a few places. The ground is not seldom so dry and hard as to prove almost impervious to ordinary rains. Dryness at the roots is the normal, and a moist root run the abnormal, state. These conditions need promptly reversing, in the interest of continuous and fairly regular supplies. We cannot control rainfall in exceptional districts, nor do we gain or lose by these so much as "Lux" and others may imagine. The rain that helps the fruit blossoms to hang on or stiffens up the embryo fruits have often done their work of binding or loosing vital connections months before the flowers were shed off. Even now July 23, there are probably thousands of fruit trees North and South whose roots have hardly tasted water since the middle of May. One of the greatest surprises among growers of fruit trees of considerable age and size has been the extreme dry state of their roots.

D. T. FISH.

THE VEGETATION OF ASHANTI.

On the recommendation of the Kew authorities, Surgeon-Captain H. A. Cummins was appointed a member of the medical staff that accompanied the military expedition to Ashanti in 1895-6. He travelled from Cape Coast Castle to the Moinsi Hills, 150 miles inland; and, being stationed for three weeks at Assin Yan Kumassi, 58 miles from the coast, was enabled to collect specimens of the flora and obtain information about the country. The collection of 200 species has been worked out almost entirely by Surgeon-Captain Cummins, at Kew, since his return, and with the result that nine new species and one new genus have been discovered.

In an interesting communication appearing in a recent *Kew Bulletin*, Surgeon-Captain Cummins gives much information anent the geography of the country, climate, and vegetation. He states that there are two well-marked seasons—the wet, lasting from April to November, with an intermission in August and September; and the dry season, from December to March. The forest region, however, is excessively damp during the whole year, for an immense amount of watery vapour is exhaled from the leaves of the large forest trees during the bright sunshine, and soon after sunset this becomes condensed, owing to the fall of the temperature, into a thick mist, which extends over the whole forest region, and where "clearings" have been made reaches to the ground and becomes dispersed only when the sun is again high in the heavens.

With regard to the vegetation, Surgeon-Captain Cummins says that two very distinct regions exist which merge into each other: (1) the so-called "bush;" (2) the forest region.

The "bush" forms a belt along the coast for many miles, varying in width from three to twenty-five miles. It consists of a dense undergrowth of erect, scandent and twining shrubs with comparatively few grasses, sedges, and other herbaceous plants, the whole being matted together into an impenetrable thicket. Small trees occur at intervals, and a few miles from the coast huge Cotton Trees (Bombax buonopozense) appear. At Akeoful, fifteen miles inland, forest trees become fairly numerous, increasing up to Mansu, forty-two miles inland, where the dense forest region commences. Clumps of bamboos grow to a great size and in large numbers wherever the ground is swampy. Villages are very numerous as far as Mansu, and each possesses a tract of cultivated land. The natives plant umbrageous trees, commonly figs, in and around every village for the benefit of the shade afforded by them. By the roadside hedges of Jatropha Curcas, which possesses a copious white milky juice, are frequent. Strophanthus gratus and S. sarmentosus are common climbers with handsome flowers, as are also Ipomœa palmata and I. involucrata, the former having conspicuous purple flowers. Passiflora fœtida, Cassia alata, Amaranthus spinosus, and the prickly climber, Acacia pinnata, also occur. Myrianthus arborescens, a tree which possesses very large leaves, each of the six leaflets being over a foot long, is of not infrequent occurence near Dunquah. Sedges and grasses are to be seen in small numbers. Many plants which are in abundance in the forest first make their appearance at Dunquah. The ponds from which drinking water is procured are frequently covered by Pistia Stratiotes; this plant is said to have a purifying effect on the water.

The forest region commences about Mansu and is said to extend to the Kong mountains. The trees are of great height (one hundred to two hundred feet). Amongst them the cotton trees (*Bombax*) are remarkable and very numerous; each has its smooth clean trunk from epiphytes and climbers, which here find no foothold, and radiating from the base large buttress-roots. Far above the tops of the other trees the branches begin to come off and carry in the full sunshine the spreading foliage. The buttress-roots deserve further description; there are generally five or six to each tree, and the part above ground varies in length from three to twelve feet; in thickness they vary from a quarter to four inches at the borders, and when cut to the required size are used by the natives as doors for houses. Other trees of the forest belong to the following genera: Cola, Sterculia, Carapa, Eriodendron, Monodora, Acacia, Albizia, Pentaclethra, Lonchocarpus, Kickxia, Ficus, Musanga, Macaranga, and Diospyros.

The leaves of the trees form an almost uninterrupted layer of foliage which intercepts the sun's rays and causes a perpetual gloom beneath. The majority of the high trees are deciduous, forming a marked contrast to the shrubs composing the undergrowth, which are all evergreen. The undergrowth consists of various kinds of shrubs and scitamineous plants, aroids, and melastomaceous climbers. Vines and prickly scandent palms, forming lianes, in thickness from a thread to several inches, wind round each other in their struggle upwards towards the sun. To the north of the Prah the tree are more closely set, branching as a rule within twenty feet of the ground, and are covered by creepers which do not seem to impair their vitality. Epiphytic shrubs, ferns, and orchids are to be seen near the tops of the highest trees. Dracænas and palms are comparatively common in the undergrowth.

When travelling through the forest many interesting and beautiful plants are seen. Crinum Sanderianum is one—a very handsome species, the flowers of which are white and fully four inches long. Hæmanthus multiflorus has a head of bright red flowers, and is very frequent. The small flower heads of Thonningia sanguinea appear above the ground like small red stars. Vanilla crenulata, with purple and white flowers, hangs its long stems from the trees. Monodora tenuifolia has very peculiar flowers, coloured white and yellow, flecked with purple, resembling a large spider; these flowers, although three inches in diameter and very numerous, are seen with difficulty owing to their resemblance to the surrounding foliage. In many places the ground may be covered with the fallen flowers of Eriodendron anfractuosum, which is a very lofty tree. A species of [illegible] is a common climber, and it seems strange that it should not have been earlier noticed. Cephaelis peduncularis is a very common undershrub. Amongst other plants forming the undergrowth may be mentioned species of Oxyanthus, Mussænda, also Paullinia pinnata, Leea sambucina, Ancistrophyllum opacum, Dracæna arborea, Gouania longipetala, Selaginella scandens, Cardiospermum [illegible], Heisteria sp., Haronga paniculata, Oncoba echinata, species of Cyathula, Achyranthes and Aerua, Piper umbeliatum, Dioscorea sp., and many others.

Scitamineous plants are numerous. Species of Costus are frequent, and have large yellow or white flowers in a dense spike. Species of Phrynium, Amomum, Canna, Calathea, &c., occur. A few grasses were found, Panicum ovalifolium, Paspalum conjugatum, Centotheca lappacea, &c. Scleria Barteri is an extensively climbing, very scabrous sedge. Ferns and mosses are fairly frequent. Among the ferns are Nephrolepis acuta, Pteris spinulifera, &c. The orchids were few and had inconspicuous flowers. The following may be mentioned: Megaclinium falcatum, Polystachya ramulosa, Polystachya affinis, Listrostachys sp., &c. Several commelinaceous plants occurred, *e.g.*, Aneilema sp., Palisota [illegible], a plant eight feet high, with purple flowers; Pollia condensata is to be found from Mansu inland. The berries of this plant are of an intense metallic blue colour.

The system of agriculture employed by the natives in the forest region is simple. The trees are cut down in the area selected for the "clearing" and the trunks removed, if not too large and heavy, otherwise they are left to rot on the ground. All the undergrowth is then cleared away. The moist condition of the ground and foliage prevents the use of fire for this purpose. When the clearing has been satisfactorily accomplished, the soil is lightly turned up, and tubers, seeds, &c., are planted. The following are generally found in cultivation: Plantains, Indian corn, pineapples, sugar cane, yams, beans, ochros (*Abelmoschus esculentus*), papaws, cassava, chillies, castor oil, egg apples, cotton, cocoanuts, and oil palms. A distinction has been made locally between plantains and bananas; the former never become soft when ripe, and require cooking, while the latter can be eaten raw. Very little trouble is taken to keep the land clear of weeds, consequently numbers of small herbaceous plants spring up and cover the surface of the ground. Growth is extremely rapid. Ginger plants grew eighteen inches in three weeks in the "clearing" at Assin Yan Kumassi.

Plantains are largely grown, and form the principal food of the inhabitants. Indian corn is extensively cultivated and freely grown. Sugar cane is grown in many of the villages. Pine apples are found all over the country in such a way as to lead persons who have travelled far inland to believe them indigenous. Cola, rubber, and gum trees grow plentifully in the forest region, and are reported to be more numerous in the districts around Kumassi. Palms producing "wine" and oil are to be found in most "clearings;" the "wine" is obtained after the tree has been felled by applying heat to the summit, the heat causing it to exude from wounds made near the base. Oil is obtained from the fruits. The cocoa-nut grows as far north as Assin Yan Kumassi, and the bread-fruit tree at Prahsu. The Indian Mango tree (*Mangifera indica*) is cultivated, but does not appear to ripen fruit. The leaves, flowers, and young branches are usually injured by ants and other insects. The cola nuts in the region of Assin Yan Kumassi are obtained from Cola acuminata, R. Br. These trees are plentiful. The natives of this region obtain rubber from Kickxia africana. Spiral grooves are cut in the bark of the tree from which the rubber flows. This tree has a widespread reputation for yielding excellent rubber. Tabernæmontana crassa yields, on incision of the bark or fruit, a copious supply of milky juice which gives good rubber; it also grows at Assin Yan Kumassi. Gum exudes from the bark of many leguminous trees when wounded, and soon hardens on exposure to the air.

Trees producing valuable wood are in quantity; amongst them is Carapa guyanensis, which is probably the "Danta" of the natives; the wood is hard and dark. The so-called "Aman" has a white, close-grained wood; the "Ceda," probably a species of Albizzia, has a red wood. A tree yielding wood called "Quanta" is also utilised. The "Odoom" (*Chlorophora excelsa*) is said to be plentiful, and its value is well known. The Cotton Tree (*Bombax*) has a soft, white wood, and is employed by the native carpenters for making canoes, stools, &c.; its brittle "cotton" is used for stuffing pillows and mattresses. The long offshoots of several palms make excellent canes, and are much used for binding when making huts. Bamboos grow as far inland as Fumsoo; the African is not so skilful in utilising this grass for his needs as the East Indian. Native carriers take all the merchandise to the coast except timber, which is, I believe, floated down the Prah river during the rainy season. The former method is very unsatisfactory, being uncertain and expensive. A railway is urgently required for trade purposes.

The great prevalence of malarial fevers renders the forest region quite unfit for European residence; the intensity of these diseases is increased tenfold when the soil is turned up. The portion of the main road extending from Mansu to Kumasi becomes obstructed in many places by trunks and branches of trees after a tornado. The force of the wind is most felt at the edge of a clearing or near the road, where support, from the natural surroundings has been partly removed. The unhealthiness of the country is a great hindrance to the employment of European agents, but if a railway penetrated the forest zone, establishing a rapid means of communication with the healthy mountainous interior, as has been done in India, it is most probable that a great diminution in the death rate among Europeans would be the result. Trade in the vegetable and mineral products of the country could be carried on without present limitations, and the friendly commercial intercourse thus established with the natives of the interior of this wealthy land would have an advantageous influence on the neighbouring native States, and thus benefit the Colony.

MYOSOTIS DISSITIFLORA.

In your answers to correspondents (page 397) you say truly enough that the best time to sow seed of this forget-me-not is as soon as it is quite ripe. Then follows good instructions as to cutting, drying, sowing the seeds, culture of the young plants, &c., which need not be repeated. But, unfortunately, this best and most beautiful of all the forget-me-nots ripens its seed one or so at a time, from the base of the flowering stem upwards, and not in the manner of the wood forget-me-not, Myosotis sylvatica, and others *en masse*. Hence the almost insuperable difficulty of knowing when to cut and dry the flower stems of Myosotis dissitiflora in order to reap a profitable harvest of seed. So very real and great were these difficulties in practice that when I propagated this forget-me-not in thousands every year I was forced to give up raising the plants from seed to any great extent, though the ripe pods were picked off as soon as ripe, leaving the later blooms and perfect seeds in succession for several weeks or months.

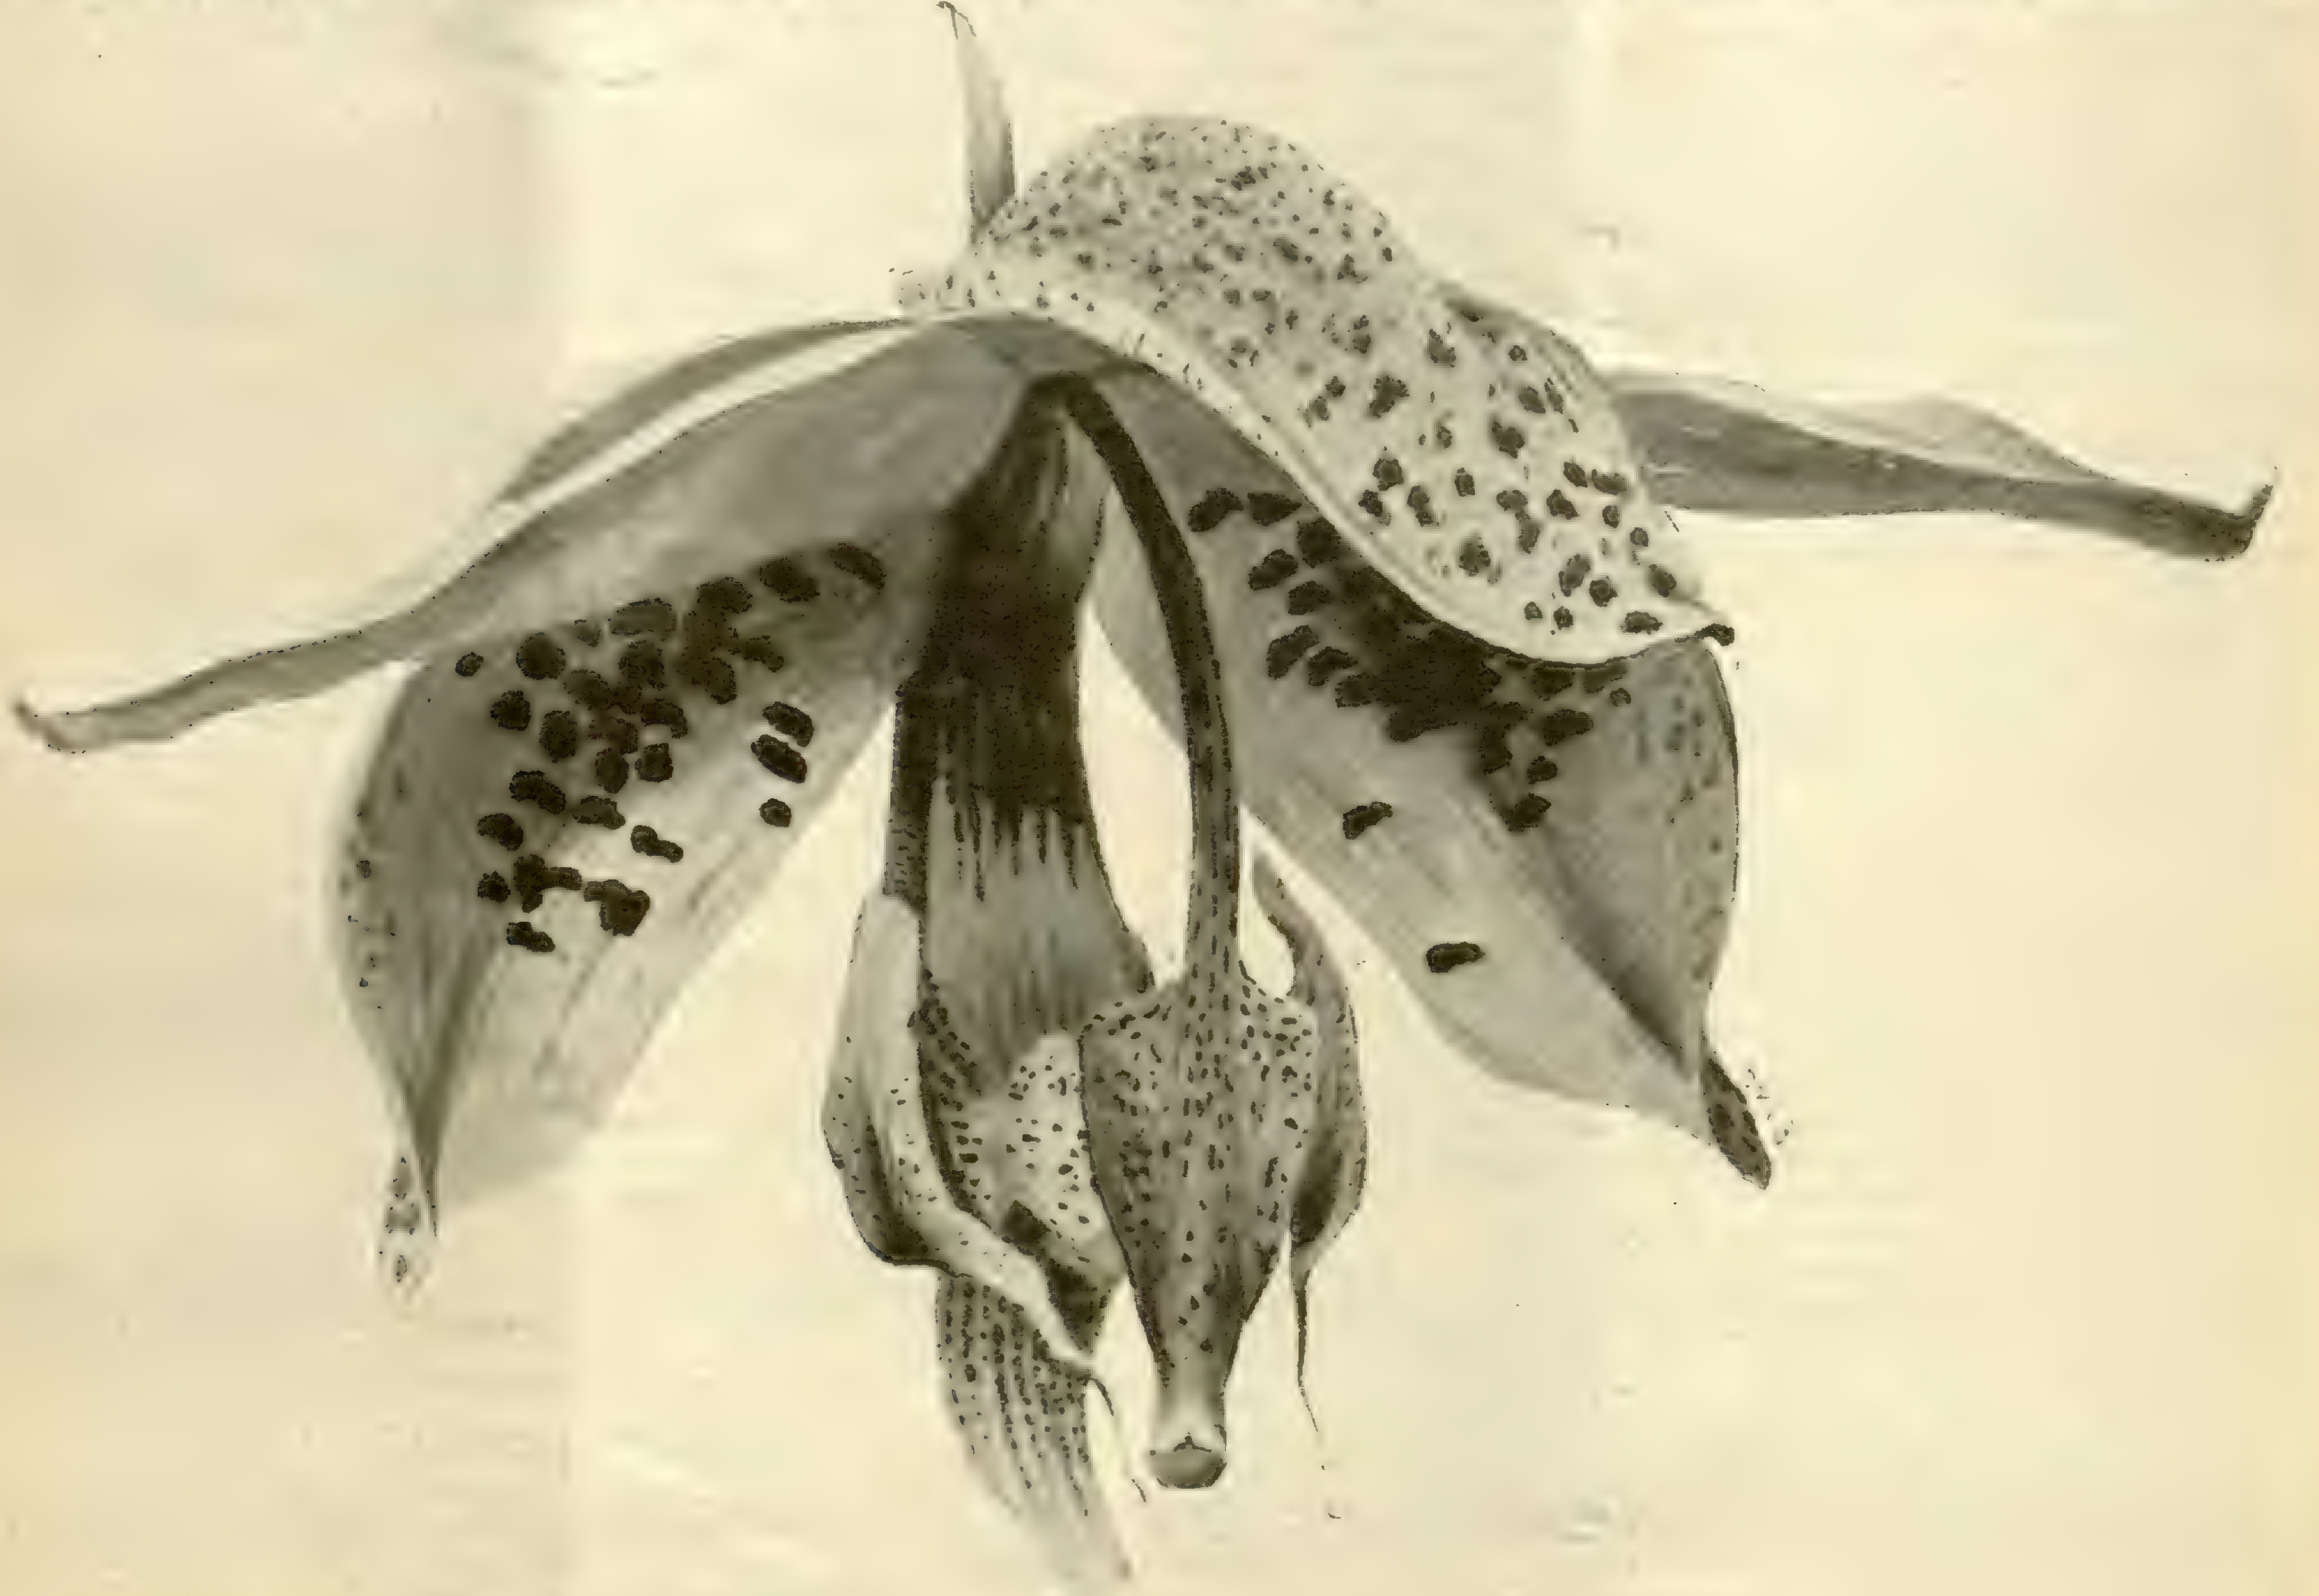
Your other plan is safer and surer than cutting off the flower stems. Carefully lift and transplant the forget-me-nots on a rich shady border, watering home to re-establish them, with as slight a check as possible. Leave nine inches or a foot between the patches, and run a hoe occasionally through the plants to preserve a loose clean seed bed for the seeds as they ripen and sow themselves. This plan will result in far more seedlings than cuttings to dry the flower or seed stalks all at once.

One more caution about this beautiful forget-me-not. Never purchase the seed without a warranty of genuineness from the seller. I have purchased it from many quarters, and never once received it true, the most common substitute being Myosotis sylvatica. The latter is one of our freest bloomers and seeders, while M. dissitiflora, from its perpetual blooming and slow ripening of seeds, yields a slow and uncertain harvest. And yet these and other sorts are often offered at about the same prices. Through the sparse seeding and our very profuse use of M. dissitiflora, we were compelled to propagate our thousands by cuttings and stool divisions, while grateful to seeds to add thus hundreds of seedlings, the latter, however, being severely rogued before being added to our general stock. After blooming, all the stools that produced increase by cuttings or through division were removed from decorative sites, and planted in good soil, some nine inches apart, in rows, with eighteen-inch spaces between them. The fresh growths were rooted as cuttings when from three to five inches long, or the stools were lifted, divided into single-rooted stems, or patches of three stems, and replanted at the same distances, to be removed to their flowering quarters in October. D. T. F.

NOTES ON ORCHIDS.

STANHOPEA RODIGASIANA.

THIS curious and wonderful orchid is remarkable for its size, curious markings, and for the fact that the species illustrates quite a new section of this quaint genus of Central and South American orchids. The honour of first flowering Stanhopea Rodigasiana in this country belongs to Sir Trevor Lawrence, Bart., Burford Lodge, Dorking, whose extensive collection of rare orchids is so ably managed by Mr. W. H. White. An expanded flower recently exhibited measured about eight inches across from tip to tip of the outstretched petals, these segments being slightly concave, and wholly of a creamy colour. The upper sepal is narrower than the two lateral ones, concave, creamy white, heavily speckled and spotted with rose and crimson on the upper surface, and tinged with green inside. The two lower sepals are also concave, broad, also creamy white, but each having an aggregation of large and blackish crimson-purple spots towards the centre. The lip is exceptionally interesting, and, as in all stanhopeas, consists of three parts, known to botanists as the hypochile, mesochile, and epichile. The hypochile, or base of the lip, is thick and fleshy, but somewhat narrow, dark crimson-purple, with a white blotch in front. The middle portion or mesochile consists of a thickened waxy centre with a large triangular blade or wing-like process on either side; in each case the forward angle is prolonged into a kind of bristle or hair, as will be seen in the illustration; the colour is creamy white, tinged with pink, shining, and speckled with crimson. The extreme front or apex of the lip is known as the epichile; this is a thick tongue-like body in S. Rodigasiana, whitish, and spotted with crimson. The column is very long and narrow, streaked with crimson, winged at the apex, where there are numerous crimson spots on a rosy ground colour. It may be added that the flowers are produced on a pendant spike, and each on a long foot stalk. The plant exhibited carried one flower and one bud, and merited a first-class certificate from the Royal Horticultural Society.



STANHOPEA RODIGASIANA.

COELOGYNE SWANIANA.

A pretty orchid that is closely allied to the well-known C. Dayana, but which differs from it in being smaller and not having reflexed margins to the sepals and petals. It has leaves six to eight inches long, petiolate, elliptic-lanceolate, and bright green. The loose, pendulous racemes are a foot or so long, and carry from a dozen to twenty flowers; each flower is two inches across, and has white sepals and petals, the latter being narrower than the former, but all about an inch long. The lip is three-lobed, the side lobes extending two-thirds of the length of the whole organ; yellowish-brown in colour, with darker brown margins and tips to the lobes; the disk is composed of crested ridges; column yellow. C. Swaniana was discovered by Mr. W. Micholitz in the Philippine Islands, and sent by him to Messrs. F. Sander and Co., St. Albans, as notified on p. 810 of the GARDENER'S MAGAZINE for December 29, 1894. A double page illustration of this pretty orchid is given in the *Botanical Magazine*, t. 7,602.

ERIA LATIBRACTEATA.

This curious Bornean orchid has short fusiform pseudo bulbs, and thick oblong-lanceolate, recurved leaves, two to four inches long. The racemes droop somewhat, are about four inches long, and carry six to ten flowers, each about half an inch across, and of a dull yellowish colour; the lip is yellow, with red side lobes. A distinct feature of this species are the broadly oblong, yellowish-green bracts, each half an inch long. This eria is of more value horticulturally than most of the hundred or so of species that constitute the genus, It was imported from Borneo, by Messrs. F. Sander and Co., St. Albans, about 1894; a specimen flowered at Kew in July, 1897, and is figured in the *Botanical Magazine*, t. 7,605.

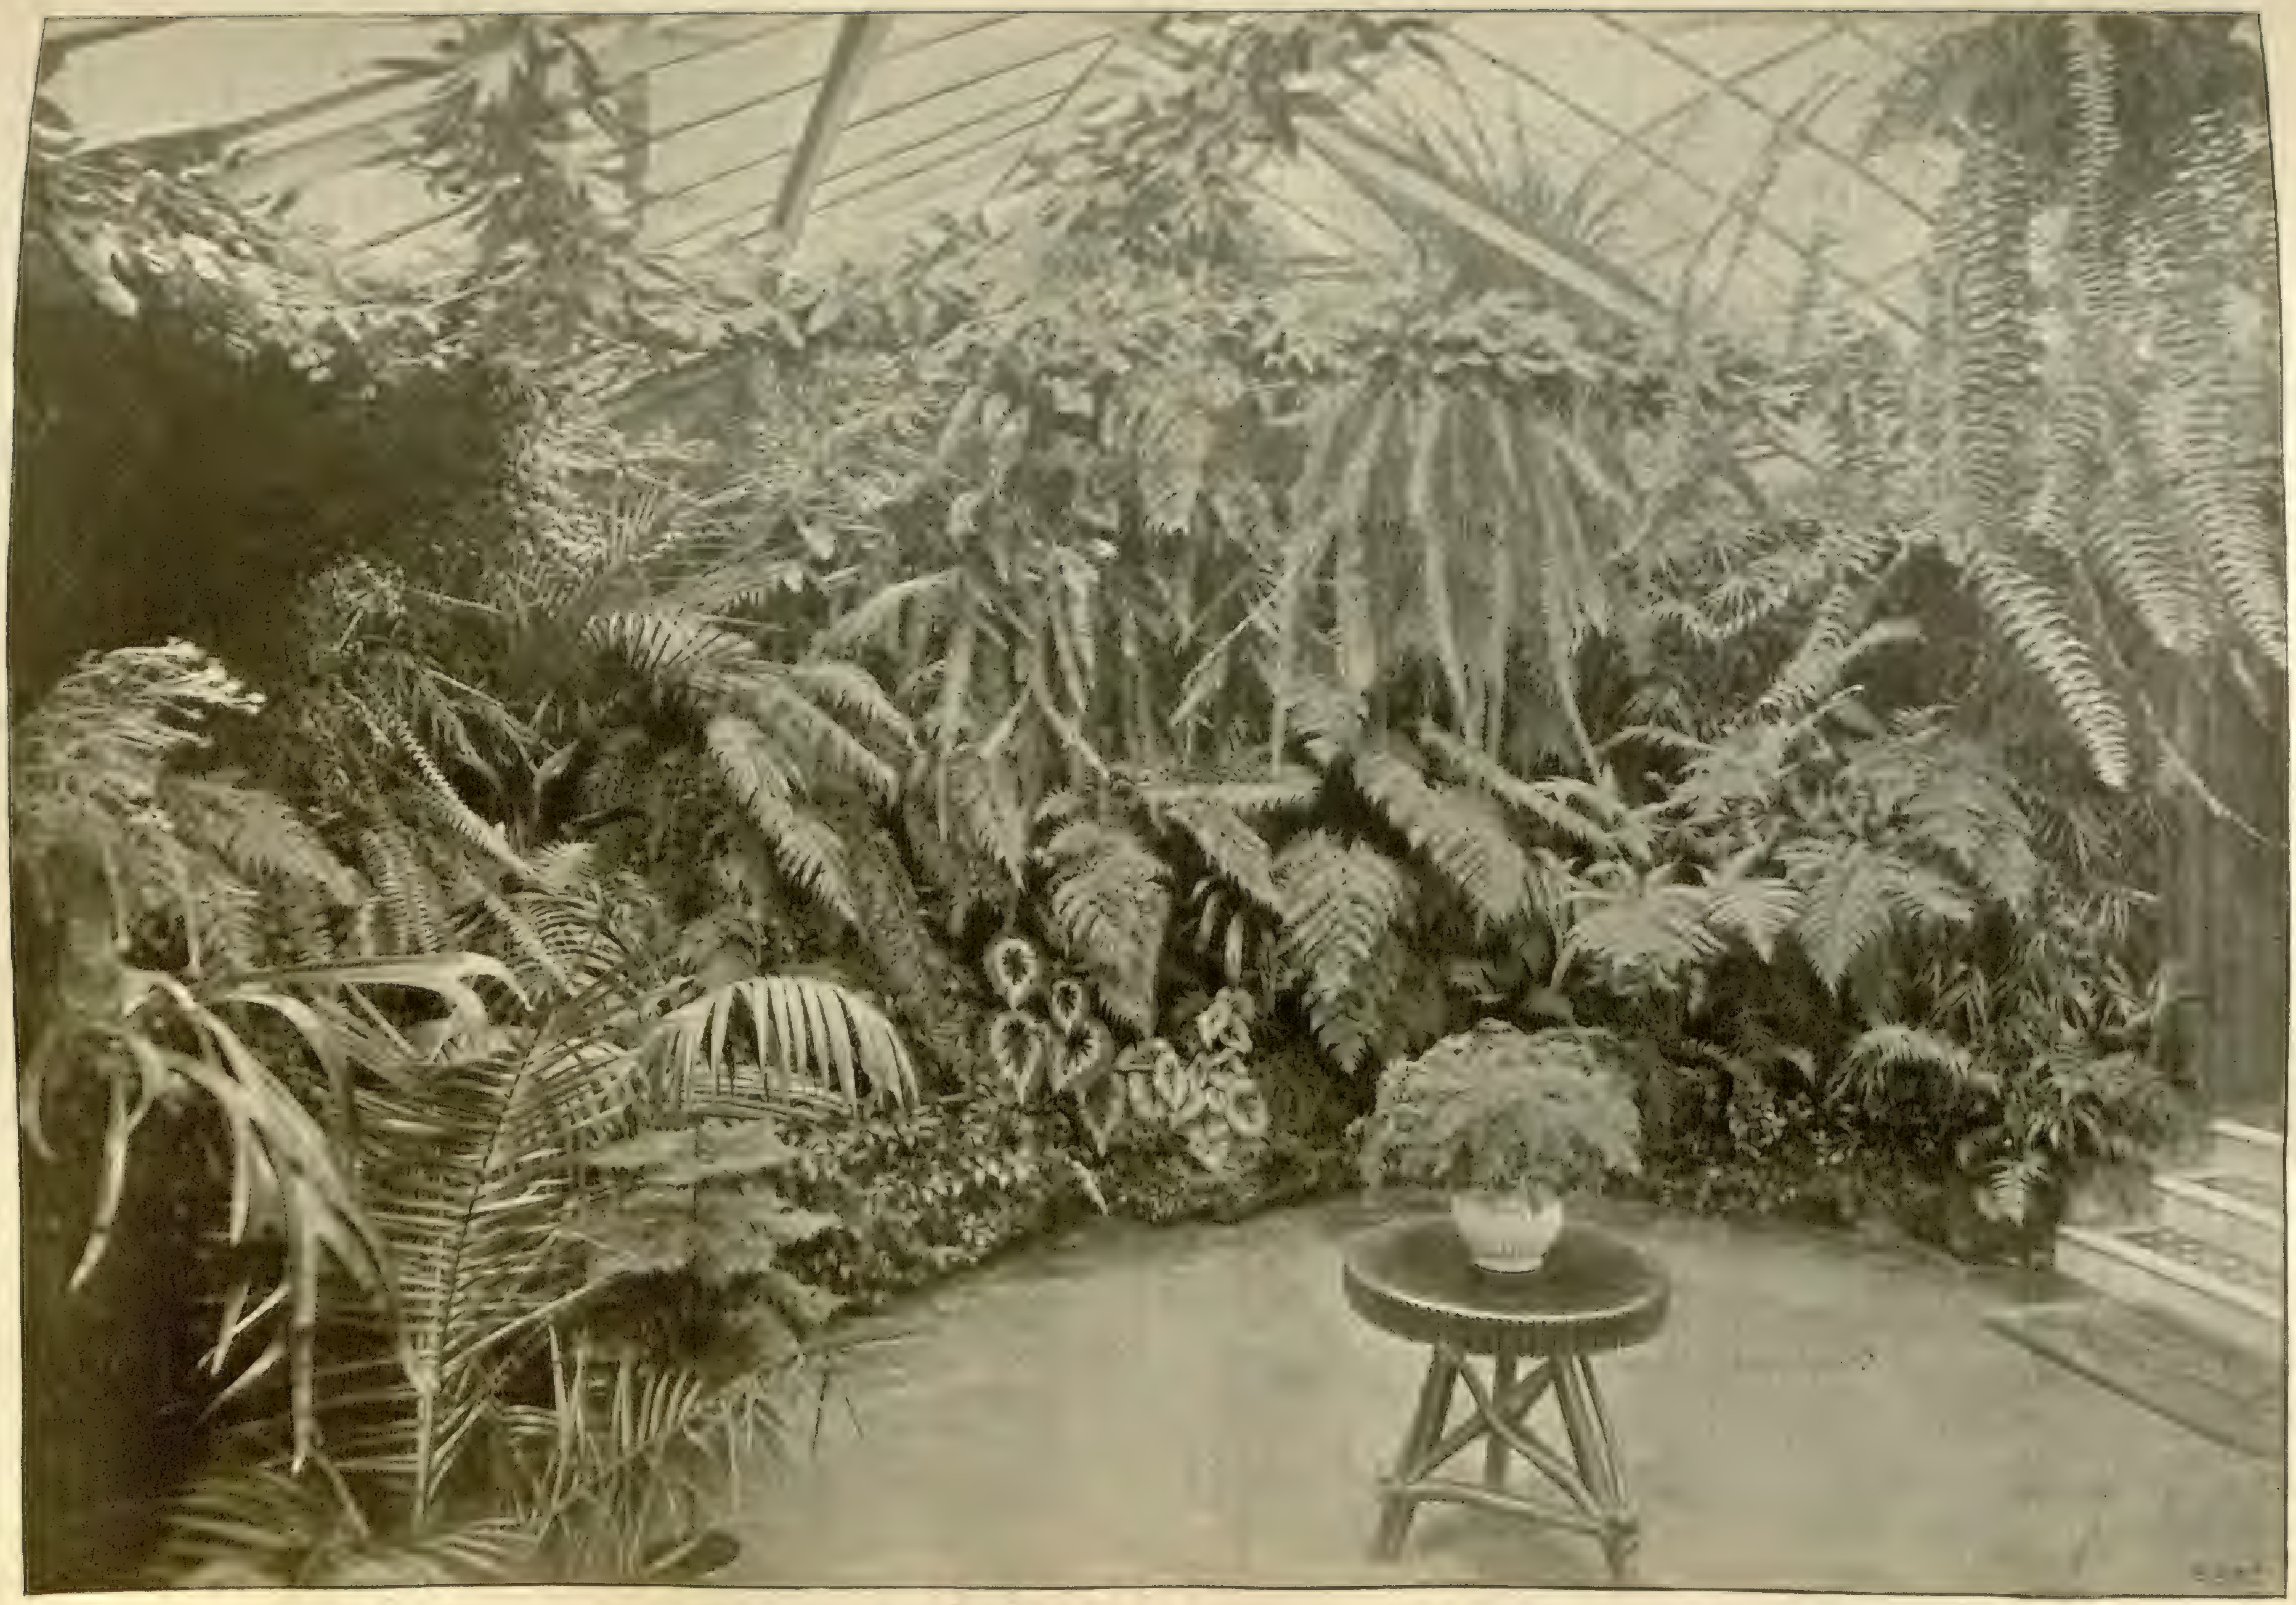
AMBLESIDE, WIMBLEDON.

CHRYSANTHEMUM growers in and around Wimbledon and Putney have during the past few years had cause to remember that Mrs. Barclay has a well-kept garden at Ambleside, and that Mr. French, her gardener, is a capable grower of the popular autumn flower, so capable that he he has not been beaten many times of late, and last year secured ten first and two second prizes in a close competition.

Ambleside is not an extensive establishment, for the whole of the grounds do not exceed three acres. The gardens are situated upon the south-eastern slope of the hill that has Wimbledon Common as its highest elevation; at the foot of this slope is the large lake in Wimbledon Park, and so neatly have the lower fence and still lower road been concealed from the windows of the house that the extensive park seems part and parcel of the establishment. The view is a charming one, either from the terrace walk above the lawns, or the more elevated verandah in front of the drawing room windows; Sydenham and its Crystal Palace are plainly seen, while Mr. French says that on a clear day he can see the tall trees of High Beeches at Sevenoaks, twenty-six miles away. In such a position as this the garden has a very large amount of all the sunshine that is going, and, owing to the lack of rainfall, Mr. French finds it difficult, in spite of heavy watering, to keep such crops as peas long in good condition. However, the usual kitchen-garden crops are looking well, and several prizes have already been taken this season with various produce.

Down through the lower lawn a path runs under an avenue of apple trees that vary somewhat in age and size, but appear to have fair crops of fruit throughout. There are fruit trees in many other parts of this pleasant little garden; gooseberries, raspberries, and strawberries occupy the lowest point; cherries, currants, and many other kinds occupy positions against the fences, so that all the available space is utilised. The Logan-berry is on trial, and ripening some immense fruits; this is its first year at Ambleside, but it has done so well that it will be retained. Melons and cucumbers, vegetable marrows, ornamental gourds, all these find a place, and in all cases fruit freely. A small and low lean-to house, quite close to the residence, contains a grand crop of tomatos, and the fruits are solid, handsome, and finely flavoured; the variety is Connell's King, and one that Mr. French is thoroughly satisfied with. A large greenhouse rises above and behind the tomato house, and is used as a secondary conservatory, for it adjoins the conservatory proper, and is lower than it. This structure is at present gay with large specimen fuschias, fully flowered, zonal pelargoniums of the finest varieties, gloxinias, streptocarpus, Harrison's musk, tuberous begonias, &c. It is in this house that a large proportion of the collection of chrysanthemums is housed and come into flower. Up a few iron steps the conservatory is reached; this is a large, almost square house, and with the exception of a few plants on a small stage opposite the glass door of the drawing-room, is occupied by permanently planted ferns, Rex begonias, &c. One half of the house is illustrated in the present issue, and shows how well

THE GARDENERS' MAGAZINE, JULY 30, 1898.



VIEW IN CONSERVATORY AT AMBLESIDE, WIMBLEDON.

Woodwardia radicans, Platycerium alcicorne, Nephrolepis pectinata, N exaltata, Pteris serrulata, Maidenhair ferns, tradescantias, and the handsome Rex begonias succeed, planted in large spaces in the rockery and on the wall. The opposite end has the rockwork quite low, and made in a semi-circle; this is similarly planted, though woodwardias are not grown here. Palms of many kinds are placed among the ferns, so that their pots are hidden. Ficus repens clothes the walls; Asparagus plumosus climbs the rafters, and until recently a passiflora was trained along the iron supports, but it has been removed. The front of the conservatory is occupied by chrysanthemums during autumn and early winter, and thus at that season there are two houses of handsome and bright flowers to be seen without the inconvenience of going out of doors at all.

At present the chrysanthemums are in rows, on an ash bed, at the lowest part of the garden; they are looking first-rate, and will doubtless give as good blooms as Mr. French has ever yet produced. There are five hundred plants in two hundred varieties, the collection containing a large number of the newest incurved and Japanese varieties. Last year Mr. French grew about nine hundred plants in 32-sized pots, but this year he has returned to the usual twenty-four or sixteen sizes, though a few are grown in small pots for grouping and cutting from. There are many visitors to Ambleside during November, and for the information of those who purpose measuring their skill in chrysanthemum growing with that of Mr. J. French, we may add that Mrs. Barclay's pretty garden is only three minutes' walk from Southfields station, District Railway, or half an hour from Putney. C. H. C.

CURE FOR THE LILY DISEASE.

IN common with many other amateur horticulturists, I have long been troubled with that widely prevailing pest known as the lily disease, and the yearly disappointment of seeing my lilies come up merely to blacken and wither away before they reach the stage of bloom, has led me to investigate the matter with a view to the eradication, or at least the mitigation, of the evil.

Some few years since I took up the whole of my bulbs of Lilium candidum to the extent of about two bushels; for I thought that by a judicious selection of the strongest among them, and by replanting in the most favourable positions, I might be able to improve the then gradually degenerating blossoms. In spite of this the disease made rapid headway, so that of late I have had but a few poor sickly stems in the whole of my garden.

I consulted the County Council lecturers of this district, both of them Fellows of the Royal Horticultural Society, only to receive the discouraging information that this mysterious disease had defied all research and all efforts for its cure, and I have read a recent article in the *Standard* to the same effect. The several attempts made to procure a healthier stock by the importation of fresh bulbs from Holland have not met with the success they deserved, for the new arrivals have been quickly reduced to the state of the old apparently worn-out bulbs by the ravages of the same disease. Hence this strange visitation has practically been stated to be an incurable disease.

I have given the subject some thought for a considerable time past, and, from what is exemplified at the present time in my own garden, I believe I may state that I have discovered a cure for this persistent evil, which is remarkable at once for its simplicity and its effectiveness. My final experiment dates back to the autumn of 1896, and was confined to three groups of the bulbs. Last season they showed a marked improvement in the blossom heads, which appeared to be entirely free from the disease, though still evidently somewhat weak from its effects in previous years. This summer I have the pleasure of seeing them perfectly healthy and well grown, with fine green stems and leaves, and the promise of large heads of bloom. Other groups in my garden, which have not been treated, have not a single blossom stem, and some of them are so far diseased that they have almost disappeared. Disease and health could not be more clearly exemplified than here, and I shall be pleased for anyone to see and compare them.

And now for the remedy, which anyone may try—I hope with the same pleasing success which has attended my own efforts. In the autumn of 1896 I removed the bulbs from the ground, and, after they had dried somewhat, I put them into a large brown paper bag in which was a supply of flowers of sulphur. They were then well shaken up, until the sulphur had been worked thoroughly into the crevices. After this, and while still well smothered with the powder, they were planted straight away, with the result which I have described.

From the nature of the disease I felt sure it must emanate from the bulb, for the bulb leaves are the first to be attacked, and it then proceeds upward through the stem to the flower, which is the last to be affected. This season I propose to treat more in the same way, and I shall be pleased to hear that others whose plants are affected with the disease have also tried this simple remedy with success.

HORACE BYATT, M.A.

The Grammar School, Midhurst, Sussex.

Cucumber, Veitch's Challenger.—This is a model cucumber, handsome and well proportioned; the fruits grow from eighteen to twenty inches in length, there being but little or no waste either at the tip or shank, and are covered with a beautiful bloom over the smooth, dark-green skin. The fruits are almost spineless, and when cut open it is at once seen that the seed space is exceedingly small; the flavour is first-rate. To these recommendations may be added that of its being a vigorous grower and continuous cropper. For general purposes it is a first-rate sort, and I am as pleased with it this, the second year of growing it as I was last season.

A. W.

FLOWER CULTURE IN THE SCILLY ISLES.

(Concluded from page 479.)

As the great advantage of the Scillonians consists in being able to produce flowers cheaply in the open air as early as they can be obtained by forcing on the mainland generally, it is questionable whether there would be much or any [illegible] in the extension of hot-houses. I am disposed to think that unheated glass houses, such as are common in Guernsey, would be more economically advantageous. As this question is to some extent connected with the conditions under which land is held in the islands, it will not be out of place to write a few lines upon that subject.

The tenure under which the farms of the Scilly Isles are held is practically hereditary, and in some cases holdings have been in the hands of the same families for two or three hundred years. Although the agreements are yearly, and in most cases, I believe, verbal, evictions are almost unknown. Security for improvements rests mainly upon confidence in the permanence of the hereditary custom, though Mr. Dorrien-Smith invites his tenants to make known their desires as to improvements, with a view to arrangements as to compensation. Apparently the tenants are well contented with the friendly arrangements made between themselves and their landlord. As a farm almost invariably descends to a relative of a deceased or retired tenant, there is no competition as to rents, which range from 2s. 6d. per acre for rough grazing land to £3 for land suitable for flowers and in favourable positions. Although, instead of falling, as in most parts of the country, rents have risen in the Scilly Isles, they appear to be moderate under all the circumstances, including heavy and continuous expenditure on the part of the landlord for the advantage of the people. Rates are moderate, and there are no licences in Scilly. In this connection it may mentioned that the general prosperity of the people is indicated by almost entire absence of pauperism. Each island supports its own poor, and there are now only five paupers in St. Mary's, one in Tresco, one in St. Martin's, and none in St. Agnes or Bryher.

The cultivation of the narcissus is comparatively simple, when once it has been ascertained whether any specified variety will flourish in a particular soil or climate. In Scilly the bulbs are usually planted in October, the small sorts about four inches by two and a-half or three inches apart, and large bulbs about six inches by four inches to six inches. In some cases the land is carefully weeded up to the time of flowering, while in others it is left untouched during the growing season, so that it becomes covered with weeds. The manure most extensively used is a compost of seaweed, farmyard manure, earth, and road-scrapings, nitrate of soda or guano and bones being also used by some growers. Mr. Dorrien-Smith and other careful growers manure heavily for the preceding crop—usually potatos—and then, as they do not allow their bulbs to stand more than two or three years, no direct manuring of the flowers is necessary as a rule, though artificial manure is applied if they seem to need it. This plan is considered preferable to the direct manuring of the flower crop. But the majority of the growers allow at least some varieties of their bulbs to stand six or seven years, or even longer, and in such cases the crops may require supplementary manuring, though they do not always get it. The Scilly growers have been censured for allowing their bulbs to stand so long, and there is no doubt that the crops become overcrowded under such circumstances, with deterioration in the sizes of bulbs and flowers alike as the result. But the saving of the expense of digging up and replanting is a great consideration, and the polyanthus varieties, which are usually left standing longest, are said to deteriorate less on that account than the [illegible] or some other varieties of the narcissus. Still the best growers maintain that no variety should be allowed to stand longer than three years, because, apart from the deterioration caused by the overcrowding of the increasing bulbs, a frequent change of soil is needed for the narcissus as much as for other crops. The different varieties of flowers are picked, as already stated, from the beginning of January, or occasionally a little earlier or later, until June, expanded in glasshouses, tied in bunches of twelve, packed in boxes, and shipped to the great markets of England and Scotland. The leaves, when they have died off, are removed, and sometimes used as food for cattle. If the crop is to stand, the soil over the bulbs is cultivated during the summer in order to kill the weeds. For transplanting or marketing the bulbs are taken up in June.

Picking is mostly done by men, and bunching by women and girls, assisted by men in their overtime when work is in full swing. Men's wages are 15s. a week; but they earn a great deal extra by bunching and packing by the piece in their overtime. Their regular hours are from eight a.m. to five p.m. in the winter half of the year, with an hour for dinner, and from six a.m. to six p.m. in the summer half, withtime for breakfast as well as for dinner.

The expense of growing narcissi is one of the questions as to which growers are naturally reticent, and inquiries upon that point could not fairly be pressed, though growers are occasionally invited to disclose even more delicate particulars of their private affairs—as, for example, in the case of a leading Scillonian who recently received a letter from a lady, unknown to him, asking him how much his income was. The expense of cultivation varies greatly with the time during which crops stand, and with the cost of bulbs, some of which are purchased at very high prices, whilst others are simply the increase of crops grown in the islands, and worth very little to sell, if they can be sold at all. If a statement made by a grower on the mainland may be accepted as accurate, to the effect that 240,000 of small varieties of bulbs are required to plant an acre, or about half as many of the largest, it may be readily imagined that the cost of planting even home-grown bulbs is by no means small, and that it is very heavy when varieties by no means the newest are purchased at £3 to £10 per thousand. With respect to new hybrids there is, of course, no question of planting by the acre, as they frequently command £5 to £10 per bulb, and I have seen one for which fifty guineas was refused. In the past very high prices were paid by enterprising Scilly growers for varieties now comparatively common, such as Emperor, Empress, and Sir Watkin. One grower informed me that he had paid £50 to £80 per 1,000 for such varieties a few years ago, while another said that he had bought Sir Watkin at £30 earlier than the neighbour who said he had paid £80. This discrepancy I am not able to clear up; but when Scilly growers bought bulbs at even £30 per thousand, it is to be presumed that they planted only a few rods of land with them, and extended the area as the bulbs increased. The expenses of manuring, cultivation when properly done, picking, raising and collecting bulbs, packing, freight, and marketing bring the cost of growing narcissi up to a large sum per acre.

With respect to the returns, they vary enormously with crops and prices. A high authority informed me that a good crop of a particularly free-flowering variety at 1s. 6d. per dozen bunches would give a gross return of £100 per acre; and probably choicer and less productive kinds, sold at higher prices, make [illegible] good returns. But prices fell alarmingly in 1897, and, although they were much better in the early portion of the present season, they have been extremely low at times since the end of March. Some details as to the fall in prices will be given presently in the evidence obtained from growers.

Mr. Dorrien-Smith's home farm, apart from his extensive growing ground and the private gardens and shrubberies, is about one hundred acres in extent, and, with the hothouses for market produce, is under the management of Mr. T. G. Brown, to whom I am indebted for a great deal of information. About forty acres are under flowers, and thirty acres under potatos. The narcissus is admirably cultivated on Mr. Dorrien-Smith's farm, as the bulbs are not allowed to stand more than two or three years, heavily-manured potatos being grown as an intervening crop, while the flower-beds are carefully weeded during the period of growth. The average weight of flowers exported by Mr. Dorrien-Smith from 1894 to 1897 was 37½ tons per annum.

It remains to present a few illustrations of the fall in the prices of flowers more precise than those which are based on off-hand statements. Accounts are so strictly kept at Tresco that the average price of each description of narcissus in each season is shown for years past. In the first place it is to be observed that no variety had been sold from Tresco up to the middle of March this season at less than 1s. 6d. per dozen bunches, while 4s. had been made of Emperor, and 5s. to 5s. 6d. of the earliest Ornatus. The records show that while the comparatively new varieties have fallen greatly in price, the old kinds, and especially the polyanthus varieties, have suffered much less depreciation. Scilly White, indeed, seems to have kept up its price well, as its averages for the eight years, 1890-97, were respectively, per single bunch, in pennies and fractions, 1·44, 1·57, 1·60, 1·29, 1·30, 1·85, 0·97, and 1.51. Here we find the highest average for 1895, while even in 1897, notably a year of extremely low prices for narcissi generally, the average was 1·51d. per bunch, against 1·44d. for 1890. Grand Monarque fell from 3.44d per bunch in 1890 to 2d. in 1897, and Soleil d'Or from 2·18d. to 1·57d., while the old double daffodil was 3·99d per bunch in 1890, 2·6d. in the following year, 1·8d. in 1895, and 1·77d. in 1897. Taking the case of the giant of the daffodil division among varieties at all extensively grown at present, the splendid Emperor, there is a great drop to be noticed, as its average was 5·88d. per bunch in 1890 and 6·54 in 1891, as compared with 2·52d. in 1895 and 2·22d. in 1897. Ornatus, again, a great favourite, and now very extensively cultivated on the mainland, has lost heavily in value, at least so far as Scilly growers are concerned. When it comes into flower with them abundant supplies of other varieties from the mainland are in the markets, so that it does not fully share the advantage which gives a temporary monopoly to Scilly for earlier varieties of open-air narcissi. It is to be observed that these are the average prices of open-air flowers only, those of forced flowers, of course, being higher.

Mr. Brown is of opinion that the polyanthus varieties will be the mainstay of Scilly growers, because, he says, these varieties do not flourish on the mainland or in the Channel Islands. Mr. Martin John Sutton informs me, however, that they are produced to a considerable extent in the Channel Islands; but, while they are also grown to a limited extent on the mainland of England, I have not seen or heard of their cultivation for market anywhere but in Cornwall, and it appears that, although they can be grown elsewhere, the bulbs do not increase, so that it would not be profitable to grow them on a large scale for market.

In spite of the keen and growing competition in the production of the narcissi, it appears to me that the Scilly growers, if they make the most of their opportunities, instead of relying too much, as some of them do, upon their natural advantages, will be able to hold their own; and although they may find that their profits in the future will be smaller than those of the past, there seems to be no danger of flower-growing in the climate-favoured little islands ceasing to be fairly remunerative.

Tomatos.—Good home grown fruits are selling in the shops and markets, retail, at 7d. and 8d. per lb.; that is a good price and should satisfy growers in the month of July. But when it is remembered how many thousands of persons are engaged growing tomatos under glass, and what extensive ranges of houses are devoted to them, may it not be a matter for surprise that fruits should yet be so relatively scarce and dear. We see a great quantity of the unripe pale red imported fruits retailed at from 3d. to 5d. per lb., and no doubt great quantities are sold. But this fact serves to show that home enterprise in the production of early supplies, entirely fails to keep pace with the demand, and probably always will. It is so improbable that every home-grower will be able to produce early under glass at a cheaper rate than they do at present, that although imported tomatos are poor substitutes for home-grown ones, yet the million must be content with these up to a late period in the year or go without. When it is said, as is so often said, that we spend twenty million sterling annually for produce that should be grown at home, we are apt to overlook, or shall I say nonpractical critics are apt to overlook, the fact that a great quantity of this produce comes to us in seasons when we are unable, through adverse climatic conditions, to supply it. Too often also it is forgotten that a large portion of our foreign trade is reciprocal, and that in return for the twenty millions thus spent, probably twenty millions of our own productions or manufactures are exported. All the same we do most heartily desire to see a far greater quantity of fruit and vegetables produced at home than is now raised by growers.—A. D.

Some Old Roses.—It was most interesting and surprising to me the other day at the Richmond Show to see in several collections of roses some very fine blooms of the old Souvenir de la Malmaison, and the hardy but ancient General Jacqueminot. If the latter has been in commerce some forty-five years, surely the former has been so for more than half a-century. When, therefore, it is remembered what a wonderful advance has been made in rose development during the intervening period, it does indeed seem remarkable that such ancient varieties should still be found good enough to be placed in really good collections at the close of the nineteenth century. Contemporaneous with these two varieties in the middle of the century was the crimson Geant des Battailes, the huge Baronne Prevost, that lovely globular pink Coupe d'Hebe, and a few others which I have forgotten, but one scarcely now exists with the exception of the two first named. Souvenir de la Malmaison is yet grown very largely in gardens for bedding, and in bush form, and also trained, not too tightly, against walls. We have so few of the old Bourbon section of roses now in commerce that this old variety, which I observe Mr. F. Cant mentions as being sent out in 1843, is well worth preserving. General Jacqueminot, sent out just ten years later, the same year that saw the introduction of the famous Gloire de Dijon, is yet one of our richest crimsons, and is still one of the best of H.P.'s. It is very largely grown for market purposes, as in the expanding bud stage it is a first-rate variety for bunching. Cloth of Gold is another 1843 rose, but it has nearly disappeared from general cultivation, and Devoniensis, sent out five years earlier, a popular rose during the fifties, has had to give place to others of more recent introduction. Niphetos was less known in the fifties than was the preceding, though put into commerce in 1844. That is still one of our most widely grown and popular teas. What a most interesting competition could be created out of a class which would include three varieties sent out in each of the six decades of 1840 to 1899. That would be eighteen trebles, and would illustrate in a striking fashion the progress of the rose for a period of some sixty years.—A. D.

WORK FOR THE WEEK.

WARM ORCHIDS.

Cattleya Bowringiana, one of the most useful cattleyas we have, flowering as it does at a time when orchid flowers are scarce, will now be growing vigorously and the roots will be fairly at work, therefore copious waterings will be required, although not sufficient to cause the soil to become sodden, for if this occurs the bulbs go black and the rot gradually works its way through the rhizome; plenty of fresh air will be necessary and this afforded every satisfaction may be expected at the flowering season. This is an invaluable species where large quantities of cut flowers are required; it is also valuable to the hybridiser. C. Mantini and C. Wendlandi, which are both results of hybridisation from the above, are fine orchids and ought to be grown in every choice collection, Some plants of C. labiata autumnalis will have made up their growths and formed flower sheaths; such must not become dry at the roots, nor must water be given to excess, or the spikes will die off in the sheath; those that have not completed growth must have more water and be kept at the warm end of the cattleya house. Cattleya Warneri, after flowering and a rest, will be commencing to make new roots; this cattleya grows very satisfactorily if suspended from the roof in the cattleya house either in pans or baskets. If the compost is in any way sour fresh material must be afforded at the present time to give the new roots the full benefit of it, and enable them to become fairly established before the end of the year; the plants, however, require to be treated individually as such a quantity of cattleyas of different kinds have been imported of late years that it is rather difficult to mention any proper or exact time for certain work to be done until such have become acclimatized.

Oncidium Lanceanum is a very beautiful orchid which flowers about this time of the year, but like many other favourites its life is comparatively short, although if proper care and attention can be bestowed upon it we may expect it to last a good while. Spot is a very great enemy to this charming orchid. The hottest part of the stove is the best place to grow this species, plenty of sun being allowed and the syringe used freely while the plant is growing; oblong rafts well crooked and filled with rough fibrous peat and a little moss, the plants being firmly wired down to it, and suspended from the roof, afford conditions that answer well. Oncidium Jonesianum is also another very difficult subject to grow satisfactorily, hence its scarceness, though so many have been imported; this also requires hot treatment and to be fastened with copper wires to pieces of cork bark and hung close to the roof. Cœlogyne pandurata must also be classed as another bad grower. It flourishes for a time, except in very few cases; curiously enough it is sometimes met with growing well in the hands of someone who does not profess to be an orchid grower. This species also requires hot treatment and a shady position, but no water from the syringe must come into contact with the foliage.

Calanthes of the deciduous section will be growing strong, consequently a little stimulant gradually increased in strength as the bulbs develop will prove very beneficial, and encourage strong sturdy spikes. C. veratrifolia, of the evergreen section, may require repotting after flowering; this may be done now, in a compost consisting of substantial loam, leaf mould, peat, and a little silver sand, then place it at the warm end of the cattleya house, very little water being afforded until root action is fairly active. Dendrobium Deari will at the present time be flowering in many collections; the syringe must be used freely to keep down thrips, &c.; brown, hard scale is a great pest, as it lodges in the axils of the leaves; mealy-bug also attacks the young, tender leaves, so the sponge and brush must be used often and carefully. Vandas, saccolabiums, and aerides must not become dry at the roots, and the latter must be protected from attacks of beetles, &c.—T. Stafford, *Tyntesfield Gardens.*

CONSERVATORY AND GREENHOUSE.

The work connected with the different kinds of winter-flowering plants will increase each week, as potting, staking, and stopping the shoots that require it are details that should receive attention at the proper season. Cinerarias and primulas may be classed together, as the same treatment and soil practically suits both. It must now be decided what season these plants are likely to prove most useful for home decoration; if to flower before Christmas the final potting may now be given which will allow of the pots becoming filled with roots by the end of summer, and so induce early flowering. For general purposes five-inch pots are the most convenient for filling vases, &c., in dwelling rooms, a point that is never overlooked by those who have much decoration to see to, and though plants are often turned out of their pots to be used for different receptacles, there is a danger of giving the plants a check which, together with the dry atmosphere of the rooms, tends to shorten their beauty and life. Younger stock of primulas and cinerarias must be potted on as the roots require more room; use compost of a rich porous nature, and be sure the pots are well-drained. As the bed of ashes in the cold frames is kept constantly moist by syringing between the pots, there is always the danger of such a condition inducing the visits of slugs, which will make the young tender leaves their feeding ground if measures are not taken to prevent them. Soot or lime dusted round the sides of the frames will ward them off. To keep the plants growing strong, and to secure large clean foliage, moisture at the roots and in the atmosphere is imperative. The lights may be well tilted at the highest point during the day, and well shaded where not facing the north; but we find it a good plan to remove them in the evening as the plants never make more rapid progress than when the foliage is found beaded with dew in the morning. Bouvardias will now be growing freely, whether planted in the open, in frames, or treated as pot plants. When it is seen that a few shoots are taking the lead the points should be pinched out, so as to make all growths equal. Undoubtedly, those planted out make stronger growth than when the roots are restricted in pots, still fine plants may be so raised under careful treatment. A lack of water at the roots, or when water is given too freely, often causes the plants to look sickly, as bouvardias are rather delicate rooted plants; when well-established, however, and growth is being made freely, generous treatment is necessary, such as frequent watering with weak soot water or liquid manure, together with copious syringing after a hot day.

Zonal pelargoniums are most useful for giving a bright display during the dull months, but require special treatment to induce them to flower freely at that season. I recommended in the spring that a suitable number of cuttings be rooted in small pots. These will now be sturdy plants and ready for placing in their flowering pots; fairly good loam, with a little leaf mould, forms a good staple, and by the addition of a few crushed bones placed over the crocks, and a sprinkling of the same in the compost, all that is necessary in the way of manure will be afforded. After potting arrange the plants in a partially shaded position for a few days; when they have got over the check of potting select a sunny spot, and plunge the pots about one quarter their depth in fine ashes, allowing plenty of room. Treated in this way they will make grand stuff by September, when on being removed to the greenhouse, and given weak liquid manure, they will commence to flower. With Arum lilies growers differ as to their summer treatment, some favour dividing the roots and planting in the open, others keep to pot culture the year round. I have tried both ways many times, and find that the plants perhaps bloom earlier when not planted out, otherwise the results are much the same. One thing we do not advocate, and that is allowing the plants to be laid on their sides with the full force of the sun striking on the pots, as this process cannot have any other than a weakening influence on the plants. Where the plants have been placed on one side since flowering, the main part of the foliage will have died off; now is a good time to divide them. The largest should be potted firmly in six inch pots, or three or more can be placed in larger ones. After potting, arrange them in a bed of ashes, away from midday sun, and syringe them over occasionally. Some stand them out in the open, but this causes the soil to dry quickly, and incurs more labour in watering, but treated as advised, root action will be going on slowly, and very little attention is necessary. If it is necessary to increase the stock the off-sets may be dibbled out on rich ground, and lifted in the autumn, placing them close together in boxes.—R. PARKER, *Goodwood Gardens.*

THE FLOWER GARDEN.

WHERE herbaceous borders are extensive considerable attention will be required to keep them in a clean and tidy condition. Dead flowers should be removed as soon as possible from pæonies, delphiniums, &c. Tying and staking will also need attention, and at this season the borders should be bright and gay. The dry weather has been favourable for hoeing and cleaning, and if the surface soil be kept in a loose crumbly condition loss of moisture through evaporation will, to a certain extent, be arrested. Mulching with old mushroom bed or other short manure is of great assistance where it is possible to carry out these operations, as then with a good watering the plants are preserved in a moist and growing condition for some time. In our light soil many subjects are now showing signs of distress from the continued drought, and a really good rainfall would be very acceptable. Watering where possible will be needful to preserve phloxes, heleniums, galegas, rudbeckias, campanulas, helianthus, and similar plants from becoming unsightly through loss of foliage should the present hot and dry weather continue. Several subjects in these borders may be lifted for propagation when the weather permits. Heuchera sanguinea is a useful front row plant, and generally requires annual division if good young flowering plants are desired. The old woody portions of the stem should be rejected, as young outside shoots soon form strong plants. It is also easily raised from seeds, which should be sown as soon as ripe, and when raised in this way some variations in colour are often obtained. Varieties of Iris germanica may also be lifted and divided, or the size of the clumps reduced if necessary. Those lifted and divided now become well established before the winter, and the flowering of next year is not impaired. A slightly shaded border may be devoted to the growth of German iris which, while in bloom, are handsome and at other seasons the foliage is pleasing. Any surplus plants may be set out near the margins of lakes, or vacant spots in the semi-wild garden or shrubbery border, while in masses in a bold position on the rockery these irises are also effective.

Garden pinks having mostly passed the flowering season, pipings may be struck now if any increase of the stock is desirable. With these it is advisable to propagate some plants annually, that the older and worn out ones may be renewed, as those from one to three years old produce the finest blooms; although pinks strike fairly well in a cold frame or handlight if kept close, roots are formed more quickly and with greater certainty if a mild hot-bed be used, and this in most places may be easily spared now that the bedding-out season is over. A hot-bed that has been used for striking bedding plants will suffice if the surface be slightly freshened up, and on this place the frame or handlights, and in these about three inches of sandy soil, that has been passed through a half-inch sieve. Press this down firmly, and over the surface scatter a little silver sand, and it will be ready for the cuttings. The latter should be about three inches in length, and cut through under a joint, strip off the bottom leaves for the space of an inch, nip off the extreme points, and the cuttings are ready for insertion. Holes should be made with a small dibber to the required depth, about two inches apart, making sure that the base of the cutting rests on the bottom of the hole. Press the soil firmly round each with thumb and finger, afterwards giving a thorough watering to well settle the soil about them; keep moderately close, and shaded from bright sunshine until rooted. Two of the finest and most useful pinks are Mrs. Sinkins and Ernest Ladhams, the latter flowering rather late, and both varieties furnish a few useful blooms throughout the autumn. The Old White is also still acceptable, and those who like pinks will also grow the laced and other forms which are all of equally easy culture, and may be increased in a similar manner. Seedpods on such subjects as sweet peas and violas should be removed as soon as possible after the flowers fade, otherwise they soon exhaust the plants, and flowering ceases. Verbenas and other trailing plants should be kept pegged down until the beds are nearly covered, and carpet beds will need frequent watering after hot days.—C. HERRIN, *Dropmore Gardens.*

HARDY FRUITS.

IN most parts of the country it will be found necessary to protect bush fruits from birds. Red and white currants hang a long time if netted over, and though I have advised cutting back gross top growths before netting, it is not wise to expose the fruits too much, as they shrivel much in hot, dry weather. In reducing the new growth at the upper portion of the trees netting is facilitated, and with old trees the wood is not needed, while the fruit buds for next year will ripen up. Black currants are not treated thus, but even in their case I have found it an excellent plan to cut out old, useless wood or branches, and give the newly-made wood more room to develop. It may read strange to many to advise pruning black currants at the end of July, but with old trees it is a great gain to do this work if the trees are large and at all thick in the quarters; by summer pruning much better fruits will be secured the next season. All our bush fruits are later this season than usual, and the same remarks apply to strawberries and raspberries. After the crop of raspberries is gathered the young canes or suckers will need all the support the plants can afford them if the season is dry, and when cutting away the old ones it may be well to reduce the new growths; I find three, or five at the most, ample if the plants are vigorous. This is a better plan than the old one of leaving all canes growing until the fall of the leaf. Strawberry plants layered a few weeks ago should now be in condition to plant; old fruiters may be destroyed, and we find it a good plan to burn the refuse on the spot, spreading the ashes on the surface previous to planting green crops. In this district we have of late suffered much from drought, and fruit growers have a busy time in providing the necessary moisture for the various plants and trees needing the same. In many cases it will have been necessary to mulch the surface, and especially in the case of newly planted trees. Cherries soon suffer if at all dry at the roots, and in wet seasons the fruits crack badly, so that the fruit grower must ever be on the alert. I never remember a season when black fly has been so troublesome, and even now unless regular washings are given it is a difficult matter to keep young shoots free of the pest. As soon as the fruits are cleared a strong insecticide may be used, and any useless wood cut away, and main shoots tacked in; the trees are then more readily kept clean. Morello cherries may now have attention, and though I am adverse to much cutting back with the knife, yet a good deal depends upon the soil as to what new wood the trees can carry. The finest tree I ever saw was regularly summer pruned and the fruit produced on spurs. It is well to do any pruning necessary now, as with strong trees it is impossible for them to carry all the wood made and the new wood needed in most cases will now be strong enough to lay in. Cherries cleared of fruits should now have liquid manure, as few trees need more moisture if against a warm wall and with sloping border. These trees root near the surface and soon feel the effects of drought, and if the crop has been at all heavy there has been a great demand on the roots.

Apricots swelling up their fruit also need assistance, and with trees on a south aspect, I have found it a great gain to syringe the foliage in the evening, as few trees feel the drought like apricots; though the fruits of early varieties may now be cleared, the trees will be perfecting their growth for another year. With trees ripening food cannot be given, but once the crop is cleared it is well to give food liberally, and in our light soil we often find it necessary to give additional mulching material. Any old wood or large spurs may be removed to give the new wood room, and encourage new shoots close to the wall; young shoots near the base of the trees should be laid in, for the apricot is so uncertain that new shoots will be a welcome addition in case of losses. Pears on walls, grown as cordons, will need liberal feeding, and here liquid manure may be used to advantage, and in poor soils it will be well to mulch also, as the mulch will help retain the moisture. Stopping will be needed, and with cordon trees it is much the best to do this work regularly, so as to build up fruit spurs for another year. Apples grown in the same way are inclined to be gross, and if not checked there will be few fruits; trees that do not crop well should be noted for root pruning early next autumn. Peaches and nectarines will need attention, and though in the southern parts of the country the wood will ere this have been attended to, yet in later districts the work is still to be done, and here I would urge the importance of thin training, as thick trees cannot properly ripen their wood; every shoot should have room to develop. I am not in favour of hard cutting back, but would freely extend the trees, though by having ample spaces between the branches there will be finer fruit and less fear of failure. The trees will need supplies of food, especially later varieties, to enable them to swell up the crops; nitrate of soda or guano will do much good. Mulching must not be neglected; syringe or hose the trees freely in hot weather just as the sun declines, and any varieties that are subject to mildew must be dusted freely with sulphur. —G. WYTHES, *Syon Gardens.*

NOTES OF OBSERVATION.

Wild Roses.—Of all the single varieties or kinds of the rose family now in cultivation, few seem more beautiful than is what I conclude to be Rosa arvensis. It is curious to note how this species flourishes in some localities, and Rosa canina, with its beautiful pink flowers, is rarely seen. But whilst the latter towers up in the hedgerows and forms on them singularly beautiful objects, Rosa arvensis grows lone and spreading. It is naturally bushy. I find it most plentiful on stiff clay soils. Has it been used materially as a breeder? It is less spiny than is canina, and does not send up those coarse stems we call suckers. Rosa arvensis seems to be specially suited for fronting the margins of woods, as its low branching habit keeps it near the ground. Its flowers are pure white, and produced very profusely. In many respects it is preferable to some of the coarse-flowered varieties that have been put into commerce. It is assumed that there are several distinct rose species in Britain. Certainly with canina, arvensis, and rubiginosa, the sweet briar we are most familiar. Why do not rose raisers try to produce a new breed from Rosa arvensis?—A. D.

Vine Feeding.—Admitting that water pure and simple is food, we must also admit that at certain stages of vine growth other or richer food is a necessity. What is the best time to feed vines is always a debateable question. On the one hand no doubt the vine will use at some time or other all or the greater portion of whatever food we give it. From the practical side of the question, however, we want so to apply fertilisers that the vine with its fruit shall receive the full benefit at once. So long as berries remain quiescent during the storing, very soon after the second or final thinning, wait, but immediately there is the least signs of the last swellings then watering and feeding should be done. I put watering first, having in my mind the extra dose given them in order to prepare for the feeding. Liquid manure is an easy method of quick feeding, either from farmyard manure or made from soot; but no doubt the best results are attained by the free use of chemical or prepared manures. Should there be the least question of any excess of ammonia, the escape of which would endanger the foliage on a bright day, give extra ventilation. Most of the chemical or prepared manure, if mixed with equal portions of loam or garden soil, can be safely given even on the hottest days. If borders will admit it, lightly prick over after heavily watering before applying the manure.—STEPHEN CASTLE, F.R.H.S., *Bottesford Vineries, Notts.*

Peaches in the Open.—We are all only too glad to hear of the success of Mr. Cook or other good growers of peaches in the open air. The question of spring protection may or may not be associated with the successful culture of peaches, nectarines, apricots, plums, pears, &c. Good crops have been grown with and without protection, as also by many different methods, but locality is a potential factor in such matters. Nothing in Wiltshire, says Mr. Cook, is gained by having any protection over the trees after May. Good, then uncover as he does as a sensible man. But other growers have their blossoms or embryo blossoms blighted through May or even into June. Then they should protect until the danger is over or not at all. I am glad that Mr. Cook also approves of tentative disbudding, the earlier perhaps the better in Wiltshire, but certainly not the safer for the young fruits in many other places. Another sentence or two deserve a passing notice. I have been wondering, writes Mr. Cook, what the trees would look like after being covered with bracken, asparagus haulm, or other thick material, and this close on the tree; and how is it possible for the trees to be healthy under such conditions. In this sentence Mr. Cook uses the word thick instead of thin flimsy material, which makes all the difference in the world in the sense. Peter will welcome Mr. Cook with open arms as a warm advocate of the varmint theory, and I will hasten to keep out of hot water on other points just now, though I was one of the first practical gardeners in England to burn my fingers badly syringing the "varmints," that is the aphis, with water at 140 Fahrenheit. The fruit trees, roses, &c., soon showed their resentment at this high temperature, which had to be reduced 10 degrees, and then finished the "varmints" without scalding or turning a leaf.—D. T. F.

EXHIBITIONS AND MEETINGS.

ROYAL HORTICULTURAL SOCIETY, July 26.

THERE was a splendid and varied display of fruits and flowers at the Drill Hall, on the above date. Orchids were not numerous, but graceful bamboos were plentiful. Hardy flowers of all kinds were splendid, especially the sweet peas and roses. Fruit was good, the trained gooseberries and currants from Messrs. J. Veitch and Sons forming a most interesting display.

FLORAL COMMITTEE.

The bulk of the exhibits came before this body, and the members had a busy time making the various awards and allotting medals to meritorious displays.

Messrs. Dobbie and Co., Rothesay, had an extensive display of hardy flowers, sweet peas and violas; particularly good were the bunches of Godetia Gloriosa, crimson and rose; yellow sweet sultan, marguerite carnations, white sweet sultan, and the sweet peas named Meteor, Salopian, Queen Victoria, and Duchess of York. Liliums and irises in quantity were tastefully displayed by Messrs. R. Wallace and Co., Colchester; Lilium speciosum album, L. odorum, L. Browni, L. Humboldti, and L. auratum were very handsome. Hemerocallis aurantiaca major was first-rate, and other interesting subjects in the display were calochorti, brodiæas, Kæmpfer, irises, carnations, and Michauxia campanuloides, a noble biennial with white flowers. Mr. M. Prichard, Christchurch, Hants, showed a splendid lot of bunches of hardy flowers, and among the good things staged we noted Platycodon grandiflorum pollidum, Menziesia palifolia alba, Spiræa palmata, Heliopsis scabra major, Gentiana thibetica, Liatris spicata, Stipa gigantea—an elegant grass, Lathyrus latifolius albus, &c.; Mr. Prichard also showed a handsome example of Campanula mirabilis, carrying a fine lot of palest blue flowers. Messrs. A. W. Young and Co., Stevenage, showed a group of annuals and other hardy flowers; sweet williams, carnations, coreopsis, &c., were largely staged.

Mr. H. B. May, Edmonton, showed finely-flowered plants of Bouvardia jasminoides and B. Queen of Roses; he also put up a handsome collection of pterises, consisting of one hundred species and varieties; P. ludens, P. Reginæ, P. gracilis multiceps, P. tremula Smithiana, P. tripartita, P. falcata Doniana, and P. sagittifolia were all fine. Mr. J. Fitt, gardener to T. W. Campion, Esq., Reigate, showed a magnificent lot of sprays of the lovely Crimson Rambler rose, all the flowers being finely developed. Mr. Tomlinson, gardener to B. Hoffman, Esq., Thornton Lodge, West Dulwich, showed a pretty group of caladiums, all the plants being well coloured, fresh, and nicely associated with maidenhair fern; Mons. Leon Say, Fred Moore, Louis Van Houtte, &c., were all charmingly coloured, and represented, as all were, by neat, well grown specimens. Hardy flowers in quantity were exhibited by Messrs. Barr and Sons, Covent Garden. Gaillardias were very good; phloxes, lychnis, Kæmpfer irises, Inula glandulosa, Lathyrus latifolius albus, coreopsis, and eryngiums were especially good. Messrs. J. Carter and Co., High Holborn, exhibited a large number of varieties of sweet peas, staging them in small, tight bunches, with a spray or two of asparagus plumosus. What might have been a fine exhibit was spoiled by inartistic display. Messrs. J. Veitch and Sons, Chelsea, showed three large stands of finely-developed carnations and picotees, and among them the yellow and yellow ground fancies were especially fine, such as Pandelli Ralli, Lady Cook, Wanderer, Voltaire, and Duke of Orleans.
